At this stage the Secretary, Mr. G. Ingram, announced the amount collected, with the names of the principal donors. He stated that the sum collected was £3,000. The principal sums were: The Earl of Plymouth, twenty-five guineas; Sir Harry J. Veitch, one hundred guineas; Messrs. Rothschild and Sons, one hundred guineas; Edward Sherwood, Esq., J.P. £100; Mrs. J. W. Campbell, £10; Messrs. Sutton and Sons, £100; Leonard Sutton, Esq., C.B.E., ten guineas; Capt. Noel Sutton, five guineas; Miss May Sutton, five guineas; Sir Edward Stern, Bart., £21; A. J. Wood, Esq., £60; Edward White, Esq., V.M.H., £50; R. W. Wallace, Esq., J.P., V.M.H., £36; W. E. Wallace, Esq., £37 5s.; J. W. H. Barr, Esq., £33; W. L. Cory, Esq., £31 10s.; Messrs. Waterer, Sons and Crisp, £25; Bernard Crisp, Esq., twelve guineas; H. G. Alexander, Esq., £26 5s.; John Heal, Esq., V.M.H., £26 5s.; Whitpaine Nutting, Esq., £25; J. B. Slade, Esq., £25; Messrs. G. Bunyard and Co., £21; W. J. Auton, Esq., £21; A. MacKellar, Esq., V.M.H., nineteen guineas; Major Churcher, fifteen guineas; F. J. Chittenden, Esq., V.M.H., fifteen guineas; Arthur Dye, Esq., £14; C. R. Fielder, Esq., V.M.H., fourteen guineas; Edwin Beckett, Esq., V.M.H., £14; T. J. Walton, Esq., eleven guineas; P. C. M. Veitch, Esq., J.P., V.M.H., eleven guineas; Chas. H. Curtis, Esq., £13; P. F. Bunyard, Esq., £12; Messrs. Barr and Sons, twelve guineas; Donald McDonald, Esq., twelve guineas. The following contributed ten guineas each: Gardeners' Company, P. Etheridge, Esq., Geo. H. Fisher, Esq., Edward Harriss, Esq., T. Finch, Esq., E. Manwaring, Esq., S. M. Segar, Esq., Geo. H. Cuthbert, Esq., W. Wiles, Esq., C. Grahame-White, Esq., W. L. Bradbury, Esq., Messrs. Pugh and Co. (per A. J. Wood, Esq.), and J. Condie, Esq., H. W. W. Nutting, Esq., seven guineas; J. H. Batty, Esq., six guineas. The following contributed five guineas each: Lord Lambourne, Lord Treowen, Proprietors of *The Gardeners' Chronicle*, A. Harris, Esq., J. M. Bridgeford, Esq., Joseph Rochford, Esq., Martin Mash, Esq., G. Carpenter, Esq., F. C. Eiloart, Esq., N. F. Barnes, Esq., A. W. Metcalfe, Esq., Messrs. Willis Bros., Multiflora Co., Ltd., William Robinson, Esq., Geo. Prickett, Esq., A. Dimmock, Esq., W. F. Kirton, Esq., W. Duncan Tucker, Esq., W. Howard, Esq., A. Dawkins, Esq., Sydney Cole, Esq., J. Brown, Esq., J. C. Allgrove, Esq., Arthur Bedford, Esq., and J. F. McLeod, Esq.

Covent Garden List (per Major E. J. Monro) included Major E. G. Monro's, Messrs. Geo. Monro's and Bert J. Monro's contribution towards "Geo. Monro Trust," £500, and £100 for the same object from Mrs. Monro. Also the following donors of ten guineas each; Messrs. Geo. Monro, Ltd., Messrs. John Rochford and Sons, J. P. Rochford, Esq., Raymond Rochford, Esq., A. Watkins, Esq., A. Stephens, Esq., H. Larsen, Esq., Messrs. E. Stevens, Ltd., "Geo. Monro" Concert Committee. Sums of five guineas from Messrs. Lowe and Shawyer, Messrs. Cobley, Kay and Co., P. G. Small, Esq., Messrs. Thos. Rochford and Sons. Ltd., Messrs. Nash and Austin, I. Firmin, Esq., Mrs. A. C. Swift; these, together with smaller amounts, totalling £812.

A second Covent Garden List (per Mr. John Collingridge) included Rt. Hon. the Lord Mayor and Mr. Sheriff J. E. K. Studd, ten guineas; John Collingridge, Esq., ten guineas; J. Collingridge, Ltd., five guineas; Messrs. Elder Fyffes, Ltd., ten guineas; Messrs. Parsons and Co., ten guineas; H. Miles, Esq., ten guineas; W. Robins, Esq., ten guineas; Jas. L. Kinnell, Esq., ten guineas; Messrs. C. P. Kinnell and Co., Ltd., ten guineas; Messrs. Cutbush and Son, Ltd., ten guineas; W. Maxwell, Esq., ten guineas; with the following sums of five guineas each: T. Windle, Esq., John Cull, Esq., Messrs. Slaymaker and Co., David Ingamells, Esq., Mrs. A. Butchart, Frank Ladds, Esq., J. Linford, Esq., O. Hiehle, Esq., A. Howard, Esq., and W. O. Hiehle, Esq.; other smaller sums brought the total to £241. The total amount realized at the dinner was, as stated above, £3,000.

A vote of thanks to the Chairman proposed by Lord Lambourne concluded the proceedings, which included an admirable musical programme given under the direction of Mr. Ralph Norris.

Obituary.

Thomas Challis.—It was with very great regret I learned of the death of my old friend Mr. Thomas Challis, and I shall be glad if you will publish the following particulars of his career, supplementary to those given in your issue of June 23. Thomas Challis was born on June 19, 1835, at Barton Seagrave, near Kettering, Northamptonshire, where his father was gardener to Viscount Hood. He left home at an early age and was apprenticed to Mr. James Garrod, at Belvoir Castle Gardens, where he remained seven years. From Belvoir he went as foreman under Mr. William Beach at St. Giles gardens, near Cranbourne, Dorset. From there he passed on to Trentham Hall gardens to take charge of the hard-wooded and winter-flowering plants departments, under that energetic and most distinguished gardener Mr. George Fleming, at the time when Trentham gardens were considered to be at their zenith and afforded the finest examples of gardening in the United Kingdom. After a few years at Trentham he obtained the appointment of head gardener to the Right Hon. Earl Ferrers, at Staunton Harold, near Melbourne, Derbyshire, where he remained until the Earl's death, when he undertook the management of a seed business in Derby belonging to Mr. Sam Robinson, of Melbourne. Town life and the confinement of

Digitized by Google

the shop did not, however, agree with his health, and he decided to return to gardening. His old chief Mr. Fleming recommended him to the Hon. Sidney Herbert, as gardener at Wilton House, and he entered upon his duties there at the end of the year 1860, a year remembered for its extreme severity, the thermometer registering 10° below zero on the 30th of December. The previous summer and autumn having been exceedingly wet, not only tender but hardy shrubs and trees suffered severely from the great and sudden change of temperature. Hundreds of waggon loads of dead Conifers and shrubs, even Laurels, Yew trees and Ilex, had to be cleared from the lawns and shrubberies. The Hon. Sidney Herbert, then Lord Herbert of Lea, died in 1861, and a minority of several years followed. At the coming of age of George, Earl of Pembroke, Mr. Challis retained his post as gardener, and on the death of the Earl he served Sidney, Earl of Pembroke, and also remained (till his retirement in 1915) with the present Earl. For many years he held the post of Churchwarden at Fugglestone and was a governor of Countess of Pembroke's Park School till its dissolution. He was the patentee of a lawn-sweeping machine and inventor of a system for the protection of fruit trees on garden walls known as the Challis Arcade. He was awarded the Veitch Memorial Medal and also the Victoria Medal of Honour in Horticulture. He also received a valuable tie-pin from the German Emperor in recognition of services rendered at the time of the Emperor's visit to Wilton Park. He served the Co-operative Society of Wilton from its inception, as president, retiring in 1915, at which time he received a present from the members of the Society in recognition of his services. He also received from the present Earl and Countess and the late Earl and Dowager Countess many tokens of their respect and gratitude. *E. F. Hazelton.*

Alexander Hay.—Amid every manifestation of respect and esteem, there were laid to rest in Allenvale Cemetery, Aberdeen, on Tuesday, June 26, the remains of Mr. Alexander Hay, for long the senior partner of the firm of Messrs. Ben. Reid and Company, seedsmen, Aberdeen. It is only a month ago since Mrs. Hay died, and, despite his removal to a nursing home, where all was done that could be done for him, Mr. Hay never recovered from the shock. Born in the county of Banff, 84 years ago, Mr. Hay settled in Aberdeen when quite a young man. He entered the service of Messrs. Ben. Reid and Company, and after years of thorough training and passing through all the stages of the business, he assumed partnership with the late Mr. William Gibson on the death of Mr. George Reid, a descendant of the founder of the firm. For years thereafter he maintained the good name of this fine old firm. Few men were better known throughout the North of Scotland and in the London seed markets than Mr. Hay, where his marked ability and expert knowledge were greatly appreciated. He was also a familiar figure on the Continent, his business interests there gaining him many friends. None will regret more his demise than those young men, many now holding influential positions in the world, who served under him during their business training. To the last, it may be said, many of his "old boys" kept up correspondence with Mr. Hay, his extensive knowledge of all matters connected with horticulture and agriculture generally making his advice greatly valued and appreciated.

INQUIRY.

CAN any reader of *The Gardeners' Chronicle* inform me if he has grown any of the Dutch Irises for cutting purposes. In the autumn of 1921 we planted a batch of English, Spanish, and Dutch varieties for cut flowers. The English Irises are still looking well and strong, the Spanish fairly good, but the Dutch have deteriorated very much. *C. Harvey, Shoreham House Gardens.*

ANSWERS TO CORRESPONDENTS.

CELERY DISEASED: *C. S. and Co.* In the absence of the roots it is not possible to say what the disease is caused by.

NAMES OF PLANTS: *W. C.* 1, Calycanthus floridus; 2, Spiraea canescens; 3, Olearia macrodonta; 4, Sempervivum Haworthii; 5, Euphorbia Cyparissias; 6, Ranunculus aconitifolius flore pleno; 7, Coleonema album; 8, Agathosma imbricata.—*H. A.* 1, Helianthemum vulgare cupreum; 2, H. v. var.; 3, Polemonium coeruleum album; 4, Anchusa sempervirens; 5, Viburnum Opulus; 6, Cotoneaster microphylla; 7, Geranium ibericum; 8, Pulmonaria saccharata; 9, Euphorbia, Cyparissias.—*G. J.* Claytonia sibirica.—*Correspondent.* Erinus alpinus.—*G. D.* 1, Euphorbia Cyparissias; 2, Asphodeline lutea; 3, Saxifraga Lindsayana; 4, Ajuga reptans variegata; 5, Helianthemum vulgare var.; 6, Phlox lilacina; 7, Sedum spathulifolium. — *A. Williams.* 1. Phlomis fruticosa; 2, Ruellia Portellae; 3, Cyrtomium falcatum.—*H. J. B.* Apparently a form of Begonia Lloydii.—*F. D. F.* Eccremocarpus scaber.—*J. E.* 1, Abelia rupestris; 2, Trifolium incarnatum.—*P. R. I.* Habenaria conopsea.—*H. D.* Staphylea colchica.

PEACHES DISEASED: *D. H. Bute.* The fruits are affected with Peach mildew. Dust the leaves with flowers of sulphur whilst they are damp. The water pipes should also be painted with flowers of sulphur. This should be done just before dusk, and the house kept closed for an hour or two whilst the fumes of the sulphur are being given off from the hot piping. Drought at the roots is a predisposing cause of mildew in Peaches.

PEACH LEAVES DISEASED: *W.A.C.* The complaint affecting your Peach trees is known as Shot Hole disease, caused by the fungus Cercospora circumscissa. Gather and burn all the diseased leaves and spray the tree with self-boiled lime and sulphur compound.

RHODODENDRON SHOOTS UNHEALTHY: *A. J. H* The young growths of your Rhododendron bushes are badly attacked by mildew. The cold and changeable weather this spring is responsible for the trouble, and numerous other pests which are prevalent this season. Spray the bushes with Ewing's Mildew Composition, one oz. to one gallon of tepid rain water, or prepare a mixture of the old-fashioned remedy, one lb. each of sulphur and quicklime boiled in six pints of rain water. Stir the mixture for ten minutes when boiling, then allow it to settle, and pour off the clear liquid for use in the proportion of one to one hundred of water.

SIX CHRYSANTHEMUMS FOR SUCCESSIONAL CUTTING: *R. C.* The following is a good selection of suitable varieties for your purpose: Japanese varieties, Blanche du Poitou, and Cranfordia for October; Market Red and H. W. Thorp for November; Heston White and Heston Pink for December. Single varieties: Ladysmith, Ivor Grant, Caterham Bronze, Ceddie Mason, Molly Godfrey and Mensa.

TOMATO WITH TERMINAL FLOWERS: *W. M.* Your Tomato plant will probably fruit from side growths, but we do not think it will be necessary for you to pinch out the tops of the plants for the present. Your experience with the seedlings this year will be a guide as to whether the variety is worth growing another season.

TOMATO PLANTS DISEASED: *Regular Reader.* The seedling Tomatos were very much shrivelled and dried when they reached us, but from their appearance they seem to be affected with damping-off disease. Seedlings are liable to this complaint when they are kept too close and damp.

REMARKS.—Fairly brisk conditions have ruled during the past week, and although Strawberries have been an important feature, other fruits have also sold well. A good demand is being experienced for first-grade Apples, the last consignments of which are due. Choice fruits, such as Grapes, Peaches, Melons and Figs, have sold fairly well, notwithstanding the Strawberry season. English Tomatos rose sharply in value last week-end, but at the time of writing the tendency is for prices to be easier. Cucumbers are a steady trade. A small quantity of Asparagus is still arriving, growers being tempted to cut by the comparatively high prices it is realising. French Beans are selling extremely well, due to the lateness of the season as well as dry weather, which is retarding outdoor Beans. Mushrooms are more abundant and cheaper; Peas are coming forward in better supply, and prices are lower. Apricots, Plums and Greengages from Spain are selling fairly well, as are Plums and Cherries from France. English Gooseberries are not moving too freely, the competition of Dutch berries affecting values. English Cherries are not plentiful, and at the moment are realising fairly good prices. Black Currants are arriving and selling well. Green vegetables are in moderate demand. Prices for new Potatos are easier.

REMARKS.—Supplies of all flowers are equal to the present requirements, and prices generally are lower than last week. All stands are well filled, and there is no particular shortage. Carnations are in fine condition, but there is a more limited provincial trade for them. Roses have been affected by the warmer weather, especially the coloured varieties; there are plenty of red blooms, but they are of very medium quality. Madam Butterfly, Mme. Abel Chatenay, Melody, Premier, Liberty and Molly Crawford are the more reliable sorts for decorative purposes. There is an ample supply of Sweet Peas, but they are mainly poor in quality. Double white Pyrethrum is almost over for the season, but large supplies of white Stock and some specially fine white Her Majesty Pinks are on sale. Button Pyrethrum, Achillea, Gaillardias and Alstroemeria are now being marketed. Spanish Irises are getting over, but there are some good spikes of English varieties. There has been a glut of Gypsophila elegans, and an excessive quantity of Cornflowers, Delphiniums, Gladioli, Nigella and white and pink Paeonies.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 63.2°.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, July 11, 10 a.m.: Bar., 30.4; temp., 80°. Weather—Brilliant sunshine.

Woodlice. Upon occasion Woodlice may be serious pests of plants growing in heated houses, and therefore the observations* and experiments carried out by the entomologist of the Experimental and Research Station, Cheshunt, are of general interest. Of the thirty or more species of Woodlice occurring in these islands, only five are apt to be numerous, and of these, one, Armadillidium Speyeri (named after Mr. Speyer, who discovered it in the glass-houses at Cheshunt) is the most harmful. It attacks seedling Tomato plants, gnawing their stems and biting off their cotyledons; and although it leaves very young seedling Cucumbers alone, it eats away the first rough leaves.

Where hot-water is used for soil sterilisation, the Woodlice may be kept in check. A temperature of about 146 deg. F. suffices to kill them. Failing this treatment, spraying with a mixture of potash, soft soap, 8 lbs., cresylic acid (pale straw 97 per cent. to 99 per cent.) 1 gallon, and pure naphthaline ½ lb., may be adopted. Before the spray is applied borders which harbour Woodlice should be cleared, and the soil removed some distance from the house. After flooding the surface of the soil and breaking any clods of earth, the above spray mixture is used at the rate of 2 pints to 12 gallons of water. Most useful, however, to gardeners is the improvement on the old pot-trap method devised by the entomologist at the Experiment Station. Finding that Woodlice thrive in fermented straw, he experimented with various materials, with the result that he found that common straw, boiled with a 10 per cent. solution of glucose, makes a most efficaceous trap. In one experiment lasting three days, whereas only seven Woodlice were trapped when ordinary straw was used in the flower pot, 2,712 were accounted for in the trap containing ordinary straw plus 10 per cent. of glucose. Of living traps Mangolds appear to be most useful; sliced in half, and placed, cut face downward, on the ground, they attract the pests in large numbers.

* Experimental and Research Station, Turner's Hill, Cheshunt, Herts. *Eighth Annual Report*, 1922.

R.H.S. Gardens Club Annual Meeting and Outing.—The annual meeting of members of the R.H.S. Gardens Club will take place on Saturday, July 21, 1923, when Messrs. Sutton's extensive trial grounds at Langley and at Reading will be visited at the kind invitation of Leonard Sutton, Esq. Programme:—10.30 a.m., arrive at Langley; 12 noon, lunch at Langley; 1 p.m., leave Langley; 2.30 p.m., arrive at Reading; 5 p.m., tea and general meeting. In order that suitable arrangements may be made for lunch and tea, members are requested to notify the Secretary, Mr. W. D. Cartwright, R.H.S. Gardens, Wisley, Ripley, Surrey, of their intention to be present before Saturday, July 14. A list of convenient trains from Paddington to Slough (for Langley) may be obtained on application to Mr. Cartwright. It is hoped that as many members as possible will accept this cordial invitation of Messrs. Sutton and Sons.

Bunyard Medals for Fruit.—As already announced in these pages, Messrs. G. Bunyard and Co., of Maidstone, have generously presented silver and silver-gilt medals to the Royal Horticultural Society to be offered for award to amateurs who make the best exhibit of specified fruits on certain dates. On July 10 the award was for Cherries; it will be for Gooseberries, Peaches and Nectarines on July 24, and for Plums and Apricots on August 8. All amateurs are eligible to enter, whether Fellows of the Society or not, provided that application for space is made to the Secretary of the Society by the first post on the Wednesday in the week preceding the show. The fruit exhibited must, of course, have been grown entirely by the exhibitor in his or her own garden.

An Educational Garden at Reading.—The Educational Garden and Museum of Economic Botany at Westfield, Reading, will be open to visitors free of charge on Wednesday, Saturday and Sunday, July 18, 21, and 22, between the hours of 3 and 6 p.m. The special feature of this garden is the cultivation of plants used in the preparation of medicines, foods, fibres and dyes, and the exhibition, in the adjacent museum, of industrial products derived from such plants. Refreshments will be provided for visitors arriving from a distance. Printed catalogues are also supplied.

Horticultural Trades Association.—The twenty-fifth annual general meeting of members of the Horticultural Trades Association will be held on Wednesday, Thursday and Friday, July 18, 19 and 20, at the Grand Hotel, Bristol. The programme is as follows:—Tuesday evening, July 17: 7.30 p.m. Re-union: Concert by Bristol Branch. Wednesday, July 18.—Business meeting, 10 a.m. to 5 p.m.; Dinner and social evening (Grand Hotel), 7 p.m. Thursday, July 19.—Business meeting, 10 a.m. to 12.30 a.m.; Visit to Bath; 1 p.m., lunch; 2 p.m., char-a-banc visit to Bath (Roman Baths, pump room, etc.), provided by the hospitality of the Bristol and District Branch; 4.30 p.m., tea at Grand Pump Room, Bath, by kind hospitality of His Worship, the Mayor of Bath; 5.30 p.m., visit to Messrs. Blackmore and Langdon's Nurseries, Twerton Hill. Friday, July 20.—Char-a-banc tour to Long Ashton Research Station, Weston-super-Mare and Cheddar.

The Fruit Crops.—According to the "Monthly Agricultural Report," issued by the Ministry of Agriculture, frosts and cold winds have caused a very heavy fall of Apples, and only half an average crop is anticipated. Pears are practically a failure everywhere, and Plums will give very poor yields, barely a quarter of an average crop being expected. In the principal districts the Cherry crop will be about 25 per cent. under average. Strawberries are rather under average, and in the late districts the crop is backward. Gooseberries are about average, and the crop has been cleared in early districts. Raspberries and Currants are suffering from want of rain, and Black Currants will probably be only half an average crop; Red Currants are more promising.

Agricultural Economics.—Mr. J. A. Venn, Gilbey Lecturer in the History and Economics of Agriculture at Cambridge, has written a book entitled "Foundations of Agricultural Economics," which will shortly be published by the Cambridge University Press. Mr. Venn is Economic Advisory Officer for the Ministry of Agriculture and was formerly Statistician to the Food Production Department. The object of the book is to give, within reasonable compass, some account of the origin and incidence of the numerous economic problems which affect the agricultural community. Mr. Venn is anxious that his book shall interest not only the agriculturist, but the town-dweller. "It would, indeed, be well," he thinks, if an agricultural bias could be applied "to the knowledge of history and economics possessed by this urban nation." The author has broken fresh ground in several directions, such as the question of vicarial tithes, the comparison of the yields of cereal crops in different decades, and the statistics of yields on large and small holdings in Roumania. The volume will contain six maps and twelve plates.

Horticultural Club.—The annual outing has been fixed for Wednesday, July 25, when a visit will be made to Windsor Castle, permission having been granted the Club to inspect the gardens and State apartments. The journey will be made by road and river. The party will assemble on the Embankment, outside Charing Cross District Railway Station, at 10 a.m., reach Staines Railway Bridge at 11.20 a.m., depart by launch at 11.30 a.m., arrive at Windsor at 1.20 p.m., lunch at the White Hart Hotel at 1.30 p.m., inspect the Castle and gardens, return to the White Hart Hotel for tea at 5.30 p.m., and depart by charabancs at 6.30, reaching Charing Cross at 8.15 p.m.

"Daily Telegraph" Gardens Competition.—About a year ago a scheme for awarding prizes to the best London gardens was formulated by the proprietors of the *Daily Telegraph*, and this week the prizes have been awarded. The judges were Mr. W. H. Divers, Mr. J. Heal, Mr. W. Watson, Mr. J. F. McLeod, Mr. A. J. Hartless, Mr. W. H. Aggett, Mr. W. Howe and Mr. A. Bedford. In certain cases they found it impossible to give a definite decision at once. There were gardens of almost equal merit to be decided between before the prizes could be awarded, and here the proprietors of the *Daily Telegraph* were fortunate enough to enlist the services of keen gentlemen gardeners. They were: Sir Benjamin Faudel-Phillips, Bt., the Hon. H. D. McLaren, C.B.E., Major Lionel de Rothschild, O.B.E., M.P., Major F. C. Stern, Capt. G. C. H. Crawshay, Mr. Basil Holmes (Metropolitan Public Gardens Association), and Mr. W. Watson (late Curator, Royal Gardens, Kew). The prizes have gone over a wide area, and in Class 1, where it was very generally expected that the prizes would have been awarded for gardens in the West-end, only the third was won in this district, Knights-

Digitized by Google

bridge, while the first, second and fourth were awarded respectively to gardens at Streatham Common, Hornsey and New Cross. The principal awards were as follow. Class 1:—First prize, £100, Mr. Percy Hollingworth, 5, Copley Park, Streatham Common, S.W.16; second prize, £40, Mr. Francis French, 55, Whitehall Park, Hornsey Lane, N.19; third prize, £15, Mrs. Muriel H. Morrison, 86, Knightsbridge, S.W.1; fourth prize, £10, Mrs. M. Bloxham, 58, Pepys Road, New Cross, S.E.14. Class 2 (Backs, fronts or sides of house):—First prize, £100, Mr. William Morris Jacobs, 5, Engate Street, Lewisham, S.E.13; second prize, £40, Mr. Albert Fox Eginton, 17, Seymour Road, West Hill Road, S.W.18; third prize, £15, Mr. Joseph White Smith, 118, Elsenham Street, Southfields, S.W.18; fourth prize, £10, Miss Mabel Portlock, 70, Osbaldeston Road, Stoke Newington, N.16. Class 3 (Gardens on the ground level in the congested areas of East and South-East London):—First prize, £25, Mr. A. E. B. Butcher, 86, Fort Road, Bermondsey; second prize, £10, Mr. L. Thompson, 30, Billson Street, Cubitt Town; third prize, £5, Mrs. F. L. Budd, 4, Charteris Terrace, Cubitt Town; fourth prize, £2, Mr. C. May, 50, Chapel House Street, Poplar. Class 4 (The best arranged roof garden or leaden flat):—First prize, £60, Mr. G. B. Stoker, 37, High Road, Lee; second prize, £20, Mr. E. B. West, 1, Torrington Place, Gordon Square; third prize, £10, Mr. Harold Trill, Mayor of St. Pancras, 123, High Street, Camden Town; fourth prize, £5, Mr. G. C. L. Norman, 166, Westcombe Hill, Blackheath. Over 4,000 people competed in the various classes

Flowering Plants of South Africa.—No. 11 of Volume III., being the issue for July, 1923, of the *Flowering Plants of South Africa* contains illustrations and descriptions of ten plants. Greyia Radlkoferi (tab. 101), is an ornamental shrub of the Eastern Transvaal, where it flowers from July to October, the young leaves appearing at the same time as the flowers. The inflorescence forms a terminal head of inverted scarlet flowers. Mesembryanthemum digitatum (tab. 102) bears whitish flowers in the apices of the stems, and the plate includes an illustration of a longitudinal section of the stem, showing a flower embedded at the apex. Brachycorythis pubescens (tab. 103) is an attractive little Orchid, common in South Africa, its habitat extending into tropical Africa. The inflorescence grows about 17 centimetres long, forming a many-flowered racemose spike of hooded flowers, the most conspicuous feature of which is the big violet-coloured lip. Mackaya bella (tab. 104) is a plant well known to cultivators in this country; the plate is an exceptionally fine reproduction of a flowering spray, and it also includes botanical details; the plant first flowered at Kew in May, 1869. Adenium oleifolium (tab. 105) is a very interesting Apocynaceous plant, with long, narrow leaves of a glaucous colour and with tubular flowers of a dull red, brownish in the interior of the tube; the peculiar tailed anthers and scales in the corolla throat, which sometimes form small pouches, are characteristic of the genus. Craterostigma plantagineum (tab. 106) is recommended as a suitable subject for greenhouse cultivation in this country, and, as depicted in the plate, it is certainly a very charming little plant, with irregular flowers that are freely marked with light blue on a dull white ground, and with conspicuous orange-coloured callosities which are formed by the swollen filaments of the stamens. Aloe comosa (tab. 107), when fully grown, attains to a height of 12 to 15 feet, and the plate shows a five-flowered specimen, the inflorescence forming a spike with the upper flowers hidden beneath long, reddish bracts. The flowers in the middle portion are pink and spreading, while those at the base are pendulous and greenish white. Protea pityphylla var. latifolia (tab. 108) differs from the type in its flat, linear leaves. The plant grows wild in association with typical pityphylla. Triaspis Nelsoni (tab. 109) is a member of the Malpighiaceae and forms a sub-herbaceous bush, not more than 2 feet high, the main branches always tending to droop. It is said to be one of the most attractive plants in the veldt, and is well worthy of cultivation in gardens, for, in addition to the beautiful pinky flowers, the orbicular-winged, copper-coloured fruits are very attractive; the last plant illustrated, Mesembryanthemum Pillansii (tab. 110), is said to be of special biographical interest, as the stamens do not stand erect, but are incurved towards the centre to such an extent that the filaments from the opposite stamens meet, and the anthers are consequently enclosed in the lentil-shaped cavity. The violet-coloured petals give the plant a very uncommon appearance.

Mr. John T. Jeffrey.—Mr. Jeffrey, the newly appointed city gardener of Edinburgh, is eminently suitable for the important position which he has been called upon to occupy. Born at Langholm, Dumfriesshire, he is a "son of the garden," and had the great advantage of beginning his training under his father, the late Mr. James Jeffrey, then at Harewood Hall, the seat of the Earl of Harewood, and afterwards at

MR. J. T. JEFFREY.

St. Mary's Isle, which, under the charge of Mr. Jeffrey, sen., became one of the leading places of its kind in Scotland. Mr. Jeffrey's father was a man of great taste as well as a skilful gardener, and was gardener at Cyfartha Castle and Caversham Park before going to Harewood. At St. Mary's Isle he had every encouragement to develop all departments of the garden. Mrs. Jeffrey, an able woman in every way, was deeply interested in the garden also, and it is little wonder that two of their sons, Mr. James Jeffrey, now head gardener to Lord Lonsdale at Lowther Castle, and his brother, Mr. John T. Jeffrey, have taken high places in their profession while young men. Mr. John T. Jeffrey left St. Mary's Isle to become journeyman at Drumlanrig Castle under the late Mr. Inglis, and afterwards went to Eaton Hall, where he had charge of one of the most important departments under Mr. N. F. Barnes, so that he had excellent training before going to Castlemilk as head gardener about 13 years ago. Under his care all the departments of this extensive establishment have been developed, and it now stands second to none of the larger gardens of Scotland. Extensive improvements in the indoor and outdoor departments have been carried out, and these have proved highly successful. Both gardens and policies have been vastly improved, and the experience gained at Castlemilk will be found of great advantage to Mr. Jeffrey in his new and important charge. Only those who knew Castlemilk when Mr. Jeffrey was appointed can fully realise the great improvements effected under his guidance, with the ungrudging support of his employer, Sir R. W. Buchanan-Jardine. The improvements have always been carried out with due regard to economy as well as efficiency, and few men enter upon the duties of so important an appointment as that of city gardener of Edinburgh so well equipped with such an all-round experience.

Legacies to Gardeners.—Mr. Edmund Knollys Charrington, who died on April 19, aged sixty, left his former gardeners, Messrs. Cannon and Burr, life annuities of £52 each.

Road-side Tree Planting.—In reply to a question asked in the House of Commons on Tuesday last as to whether steps could be taken in conjunction with the Department of Woods and Forests to plant the most suitable and attractive trees alongside all new roads and by-pass roads, and in cases where roads were widened to secure the replanting of trees destroyed in the process so far as is possible, Col. Ashley, Parliamentary Secretary of the Ministry of Transport, stated that it was desired that road tree planting should be extended in suitable places, and so far as funds would permit. He also stated that he had been in consultation for some time past with experts on the subject as to the best species to plant. In the case of the new Great West Road, he had already agreed with the Middlesex County Council for a tree-planting scheme. With regard to the question of planting fruit trees, as in France and Germany, Col. Ashley stated that he would have to be assured first that the fruit would not be stolen.

Horticultural College, Swanley.—Speech day of the Horticultural College, Swanley, has been fixed for Wednesday, the 25th inst. The Rt. Hon. Lord Lambourne will preside over the proceedings, which will commence at 3.30 p.m.

Fertilisers and Feeding Stuffs Act Committee.—The Minister of Agriculture and Fisheries has appointed a small Departmental Committee to inquire into the operations of the Fertilisers and Feeding Stuffs Act, 1906, to advise whether any, and if so what, amendments are necessary in order to render the execution of the Act more economical and effective, and to report accordingly. The Committee consists of the following:—Lord Clinton (Chairman), Mr. E. Richards Bolton, F.I.C., F.C.S., Mr. E. G. Haygarth Brown, Dr. Charles Crowther, M.A., Ph.D., Mr. Thomas Kyle, Mr. Brian S. Miller, Mr. George Stubbs, C.B.E., F.I.C., Dr. J. F. Tocher, D.Sc., F.I.C., and Dr. J. A. Voelcker, M.A., Ph.D., F.I.C. Mr. H. J. Johns, of the Ministry of Agriculture and Fisheries, 10, Whitehall Place, S.W., has been appointed secretary to the Committee.

Wart Disease in America.—Many of the American varieties of Potatos are subject to Wart disease, but a certain number have proved to be immune, including Early Eureka, Early Petoskey, First Early, Cordon's Early Snowflake, Flourball and Irish Cobbler, belonging to the Cobbler group; Early Harvest, Ehnola, Extra Early Sunlight, and White Albino, of the Early Michigan group; Spaulding Rose, of the Rose group; Burbank, of the Burbank group; Bountiful, Delaware, Gold Coin, Green Mountain, Green Mountain Junior, Idaho Rural, McGregor, McKinley and Norcross, of the Green Mountain group; McCormick, Round Pinkeye and White McCormick, of the Peachblow group and Dakota Red and Keeper, unclassified as to group. Most of the varieties of Tomatos tested in America have proved to be susceptible to Wart disease, but some of the tests have been inconclusive, and it is not yet certain whether different degrees of susceptibility and resistance exist in the Tomato. In general, the Tomato becomes infected less readily than the Potato requiring particularly favourable environmental conditions and appropriate stages of host development. A number of Solanaceous plants including the native Solanaceous weeds of Pennsylvania, and the Eggplant, Tobacco, Petunia and Pepper, which are in common cultivation have been tested for susceptibility to the Wart pathogen, but infection has thus far failed.

Sunday Games in the London Parks.—Notwithstanding considerable opposition to sports in the London parks on Sundays, the London County Council has decided to continue the arrangements made in 1923, with minor modifications. At the meeting of the County Council held on July 3, a dozen members presented petitions for or against Sunday games in the parks, including a strong appeal in favour of such games from clubs and shop assistants.

British Carnation Society's Exhibition.—Under the auspices of the North of England Horticultural Society and the British Carnation Society, a joint exhibition will be held in the Winter Gardens, Harrogate, on August 22, 23 and 24. Schedules may be obtained from either of the secretaries, Rev. J. Bernard Hall, Farnham Vicarage, Knaresborough, or Mr. P. F. Bunyard, 57, Kidderminster Road, Croydon.

Appointments for the Ensuing Week.—Tuesday, July 17.—Roundhay and District Horticultural Society's show (two days); Winchester Horticultural Society's meeting. Wednesday, July 18.—Sussex County Agricultural Society's show at Horsham (two days); Liverpool Horticultural Association's show (two days); Hereford and West of England Rose Society's show. Thursday, July 19.—Potters Bar and District Rose Society's show; Birmingham Horticultural Society's show (two days); Whitehall and District Horticultural Society's show (two days); Eastbourne Horticultural Society's meeting. Saturday, July 21.—Highgate Horticultural Society's show; Hale and District Allotment Association's show; North of England Pansy and Viola Society's show at Sheffield.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Remarkable Plant of Cow-Parsnip.*—At the nursery grounds of Messrs. Backhouse, Fishergate, York, is now growing a splendid specimen of the "Heracleum giganteum," the "Gigantic Cow-Parsnip plant." It is botanically allied to the common Carrot and Parsnip, and is therefore an Umbellifer. It is biennial; sown in autumn it perfects its growth in the following summer. A tolerable estimate may be formed of its astonishing rapidity of growth from the following measurement, previous to which, it may be stated, that the present subject was sown in August of 1847, and showed no signs of special vigour until early in May of the present season. Its dimensions are as follows: Height ten feet, the stem being ten inches in circumference at the base. A single flake of the leaf, which is formed of three equal divisions, is three feet six inches in length, and the entire length of one leaf, including its stalk, is six feet six inches. The foliage of this single plant extends thirteen feet in width, thus giving a circumference of thirty-nine feet! It is calculated that it would require a period of ten years or more for a plant of the common Hawthorn of our hedges to attain an equal diameter of growth with that, which in the above instance has, to a great extent, been formed in the almost incredibly short space of two months! Its flowers are of a creamy-white colour, borne on long radiating pedicels, or stems springing from a single focus, or centre, like the spokes or wires of an umbrella, and graduated in length, so as to form remarkably large and slightly-rounded table-like heads or umbels, from twelve to eighteen inches across. The rapidity and luxuriance of its growth may form a parallel with the most wonderful instances of tropical vegetation, and is considered to be the largest known plant of the order to which it is physiologically allied. For its truly magnificent growth, especially as a hardy plant, thriving in the commonest soils, it is well worthy of a place in every garden sufficiently large to display its proportions, or where vegetable structure is admired. Richly-manured ground would no doubt induce much greater vigour than that now described.—*William Wood, Gard. Chron., July* 8, 1848.

INDOOR PLANTS.

SALVIA INTERRUPTA.

THIS beautiful plant, known as the Ash-leaved Sage, is well worthy of inclusion among the many species that are used for the ornamentation of the greenhouse, although it is not often met with. Apparently its first introduction into this country was to the old Botanic Garden, Cambridge, from Morocco, in 1798, but the plant seems to have disappeared from cultivation for a time, and was reintroduced from Tangiers about 1869. It became a very popular plant on the Continent.

FIG. 6.—SALVIA INTERRUPTA.

S. interrupta is free-flowering, grows from 3 to 4 feet high, and differs from many other species by blooming during the spring and early summer, which adds to its value. The numerous flowers are nearly sessile, and usually in groups of threes, arranged in whorls, from six to nine flowers in each whorl, which are from two to three inches apart. The corolla is 1¼ inch long and 1 inch in diameter, violet-purple, with a white throat streaked with purple. The obcordate upper lip is short, laterally compressed, and two-lobed at the apex, while the lower lip is three-lobed, the two lateral ones rounded and reflexed, the palate deeply lobed, rounded and recurved. The entire flower is more than three times as long as the viscid calyx, which is deeply grooved, tubular, with triangular acute teeth.

One of the interesting features of this handsome Sage is its foliage, as it is one of the few species with pinnate leaves; these are from 6 inches to 10 inches long, consisting usually of five leaflets which are strongly nerved, coarsely reticulate, and rugose, the under-surface being covered with white tomentum, and deeply pitted. The oblong-ovate terminal lobes, from 3 inches to 4 inches long, rounded or cordate at the base, have their margins irregularly crenate; the lateral segments are oblong and rounded, sessile, or very shortly petioled.

The culture of S. interrupta is simple. Like most other Salvias, it is propagated readily from cuttings, which are freely produced, and should be inserted in June. When rooted they should be potted on as required, and stood outside during the summer. If the growths are pinched once, plants in 8-inch pots will make shapely specimens suitable for decorating the conservatory during the spring and early summer. *F. G. Preston, Botanic Garden, Cambridge.*

TACSONIAS.

THE best of the Tacsonias for large greenhouses and conservatories are T. Van-Volxemii, T. mollissima and T. exoniensis.

As the plants are rampant growers they are best planted out in a narrow bed or border to ensure them having a restricted root-run. During the season of active growth the shoots require constant attention in regulating and thinning them. The plants may easily be propagated at this time from cuttings made from the more slender and twiggy shoots. *C.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

Odontoglossum.—O grande. O. Insleayi, and O. Schlieperianum are all easily grown Orchids, but they require a temperature a little above that of the cool-house, and are best accommodated in a cool intermediate house. They are rather irregular in their blooming season, especially the last two, but if the plants are healthy and strong they are usually at their best about this season, and the blossoms, if kept dry, remain in perfection for a considerable time. No harm will accrue by allowing the flowers to remain on the plants for a reasonable time. The young growths are produced early in summer, according to the different species, but new roots are not produced until the growths have attained a considerable size, and have begun to form pseudo-bulbs. The older roots being active, the plants may, if necessary, be repotted when the young growths are a few inches high. When repotting is necessary, it should be done thoroughly, all the old, sour material being carefully removed from the roots, and the plants replaced in a compost as previously advised for Odontoglossums. In repotting any Orchid it is advisable to do so at that season when there is the least danger of giving the plant a check, that is, when new roots are about to develop. Like all other newly-potted plants, water should be supplied carefully for some time after potting. During active growth the plants need a liberal supply of water right up to the time when they have completed their pseudo-bulbs; afterwards they need only sufficient to prevent shrivelling. These Odontoglossums delight in a light position, with a free circulation of air at all times, but should be shaded from strong sunshine. They produce flowers of the largest size freely, and deserve to be grown in quantity, especially where yellow flowers are appreciated. Insects are very fond of them, especially woodlice and small snails, also scale insects, therefore preventive measures must be taken to keep the plants clear of these pests.

Vanda.—V. suavis, V. tricolor, and V. insignis, which at one time were features of many collections, do best in the ordinary shady conditions which most Orchids enjoy. The majority of the species of Vanda need plenty of shade and moisture, especially during the summer, which is their growing season; they succeed better in a warm Cattleya house temperature than elsewhere. The large growing kinds succeed best when stood on a damp medium. The smaller-growing species, such as V. coerulescens and V. Kimballiana, are best grown suspended either in pans or baskets. They should be fixed firmly in their receptacles and grown in a compost of Sphagnum moss, which should have sufficient water during the summer to keep it green and growing freely.

HARDY FRUIT GARDEN.

By A. J. HARTLESS, Gardener to Major J. F. HARRISON, King's Walden Bury, Hitchin, Hertfordshire.

Strawberries.—These plants require copious supplies of water. Where runners are wanted only a few should be retained on each plant of the more recently imported stock. The Duke is apparently the best all-round Strawberry, although it will take some time to supplant the old variety, Royal Sovereign. The Duke has the advantage of a good constitution, and is a good grower. King George is also a good forcer, the fruits ripening earlier than those of Royal Sovereign. Sir Douglas Haig is of similar merit, and these three varieties are the best for use under glass. The variety Marshall Foch appears to be a vigorous grower; but Lord Beatty is not so robust, although recommended for all soils. The new mid-season variety, Laxton's Abundance, which I have not tried, appears to be of great promise, being a very heavy cropper, with fruit of large size, but it is not suitable for forcing.

Raspberries.—The roots of Raspberries should be mulched with manure and well watered; liquid manure may be substituted for clear water occasionally. If not already in position, netting should be placed over the canes at a convenient height to permit the gathering of the fruits. Superfluous growths should be removed. The new canes that are retained should be encouraged to develop by allowing them plenty of air and light. Fruit growers, like other growers, are getting anxious as a result of the deficient rainfall. We registered only ¼ inch of rain in June. Low temperature and lack of sunshine have a serious effect on vegetation, and aphis of all kinds is abundant.

Figs.—Shoots of Fig trees not required for extension should be stopped at the second leaf. The growths should not be crowded, but have ample room for development. If feeding is required, careful judgment must be exercised or coarse growth will develop, but Figs are often grown in a restricted border against a south wall and may need a little feeding.

Cultivation of the Soil.—Hoeing between the crops of bush and other fruits must be constantly practised. Fallow ground under orchard trees should be disturbed lightly on the surface to allow the air to enter freely.

PLANTS UNDER GLASS.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Lantana salvifolia.—This plant has long, slender shoots and is a very different looking species from L. Camara. By frequent pinching of the shoots the plant will form a bushy specimen, or it may be grown in a freer manner in large pots. This Lantana is seen at its best when planted out and trained up a pillar; it then makes growth twelve to fifteen feet in length, and produces its dainty, lilac-coloured flowers in wonderful profusion.

Senecio grandifolius.—When well grown, this Senecio is an excellent subject for a large conservatory. Plants rooted some while ago will make fine, large specimens if they are potted on as they require it, while the raising of smaller plants from cuttings may still be done. Well-grown plants produce enormous heads of yellow flowers, and, even apart from the flowers, the plant is worth growing for its handsome foliage.

Senecio Petasites.—This is another good plant, with very large, handsome foliage, which is very useful for the conservatory, not only for its foliage effect, but also for the large inflorescences of yellow flowers. Plants intended for growing as large specimens should be potted on as they require it. If cuttings are inserted at this time, they make useful plants for the decoration of greenhouse stages; for this purpose they should be grown in 6 or 7 inch pots.

Phaenocoma prolifera.—This beautiful South African plant is by no means common in cultivation at the present day, but is deserving of more attention from lovers of choice greenhouse plants. It is generally regarded as being a difficult plant to propagate and grow successfully; but, given similar conditions and treatment to those afforded the South African Heaths, its management presents but little difficulty to the skilled cultivator. Cuttings made from small side-shoots may be successfully rooted during this and next month. They need to be very carefully trimmed with a sharp knife, as the shoots are covered with a thick, woolly tomentum. The cuttings should be inserted in pots of sandy peat rammed very firm, afterwards standing them under bell-glasses in a cool house. This plant succeeds best in a compost consisting of good fibrous peat and sand, with the addition of a very little light loam. The pots should be well drained, and very careful watering is necessary during all stages of the plant's development.

THE KITCHEN GARDEN.

By R. W. THATCHER, Gardener to MARK FIRTH, Esq., Carlton Park, Market Harborough, Leicestershire.

Vegetable Marrows.—These should now be growing freely if the plants were planted out in frames to give them a start. As soon as they require more room, the frames may be removed and the Marrows allowed to extend as much as possible. Keep the shoots pinched at every fourth or fifth joint, and let the plants attain a fair size before allowing them to bear. The resultant crop will be all the better for this early sacrifice. The plants should never become too dry at the roots as this retards growth and encourages mildew; therefore, afford them good soakings of water and occasional supplies of weak liquid farmyard manure.

Celery.—Keep the trenches and frames well watered in which this crop is growing, and give an occasional dusting of old soot. This is not only a fine stimulant, but also largely prevents the Celery Maggot from establishing itself in the foliage. If, however, this pest does appear, keep infested leaves picked off by hand. Batches of plants intended for late use may now be planted, and if given plenty of water they will soon make good headway. Celery is a gross feeder, and applications of diluted liquid manure about once every week or ten days will help to build up fine heads. Plants that are being blanched with brown paper bands should be examined every now and then to ascertain if they are clean and growing straight, and also to loosen the bands slightly.

Broccoli.—Continue to plant Broccoli on good ground, and give the plants plenty of room to develop. Water them in well, and place a little sifted cinder ash around each plant to keep slugs away. As the plants become larger, earth them up to keep them upright, and keep the Dutch hoe going between the rows to destroy weeds and promote the aeration of the soil. If very hot weather prevails, the plants will be benefited by applying a mulch of stable litter.

Spring Cabbage.—It is not advisable to sow Spring Cabbages too early; but in some districts a sowing may be made about the middle of July. Sow the seed thinly, broadcast, and net the seed-bed against birds. As soon as the Cabbage bed now in use is finished, the stumps may be cleared away, the ground given a good dressing of old hotbed manure, and dug over. This will provide an excellent site for a crop of late Turnips.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

Peaches and Nectarines.—As soon as these trees are cleared of their fruits, cut out the old fruiting shoots with the exception of those required for extension. This should constitute the main pruning, as it can readily be seen what amount of growth is necessary to remain to form a well-balanced tree for next season. Varieties differ in their habit of growth; some are more robust than others, and this must be taken into consideration when training in the young shoots. Ample space should be allowed for the full development of the foliage, as crowded growths mean weakly shoots and immature buds. Extra vigorous or rank wood is useless for fruit-bearing, and should be removed; in fact, it is better not to allow such shoots to develop; they should either be rubbed off or kept closely pinched back. It is advisable to examine the ties on young, vigorous trees, to see that the young growths have room to swell. After pruning and training the young shoots, give attention to the cleansing of the trees, for every precaution is needed to maintain healthy foliage until the end of the season.

Watering and Feeding.—The roots must not suffer from lack of moisture, and if the borders require moisture water them copiously. Food in some form should also be given the roots, more particularly in the case of trees which have borne heavy crops of fruit. Young, vigorous trees which are inclined to make

Digitized by Google

gross wood should not, however, be given stimulants. The ventilators should be left wide open day and night, fully exposing the trees to the light and air.

Later Houses.—Houses containing trees on which the fruits are ripening should be freely ventilated whenever the weather conditions will permit. The fruits should be fully exposed to the sunlight, in order to ensure high colour and rich flavour. After a spell of dull weather Nectarines in the later houses should be lightly shaded, as they are apt to scorch when exposed to strong sunshine. If Peaches and Nectarines are ripening too quickly for use on any particular date, their development may be retarded for several days by affording a moderately heavy shade during bright weather. The fruits in the late house having passed the stoning period, it may be necessary to thin them for the final time, and as late ripening varieties of the Peach are mostly large-fruited, the thinning may be more severe than in the case of early and mid-season varieties. Afford water to the borders when required, and use stimulants liberally where the trees are carrying full crops of fruits. Keep the house open except-ing during rough weather.

THE FLOWER GARDEN.

By C. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Polygonum sachalinense.—Being about to thin a group of this vigorous-growing perennial—the foliage of which is its great value rather than its small flowers—I am reminded of the rapid nature of its growth, for, where the ground was bare a few months ago, at the beginning of June the plant had made very large stems bearing handsome leaves, 6 feet and 8 feet high, covering the site. Obviously such a vigorously-growing plant cannot be planted anywhere, but where space permits a clump of this Knotweed is very effective. It is further particularly useful where a summer screening of any object or opening is wished—no plant that I can call to mind being so fast-growing for this purpose. A moist position suits it best, and in some circumstances it is necessary to check the spreading habit of its roots.

Rose-Tree Suckers.—These appear from time to time on standards and bushes, and must be suppressed. Uncover them and pull them out with a sharp twist, or sever them otherwise quite low down in the ground. It is not advisable to sever these suckers with a knife, for buds would form and develop into other suckers.

Tamarix.—This graceful shrub should adorn many more gardens than it does, for few plants present a prettier sight about the month of June. The small, pinkish flowers are produced in long, feathery plumes, and look delightful among the Conifer-like foliage. Tamarix gallica is quite hardy, is splendid for coastal gardens, and will succeed in most soils provided the ground is not excessively dry. Scarcely any pruning is necessary, but straggling shoots needing shortening should have attention as soon as flowering is finished in order that the young shoots may complete their growth in suitable conditions.

Border Carnations.—From about the middle of July to the middle of August—according to the season and the district—is the best time for layering border Carnations. Only the best sorts should be increased by layers, unsatisfactory varieties not being worth such time spent upon them. Light, sandy soil favours the development of plenty of roots, and the easy removal of the layers. Another good method of increasing this plant is to pull off growths of small to moderate size and insert them as cuttings in a cold frame or in pots placed in a cold frame. I have rooted many layers in the open ground, but the percentage of failures is always higher than in a close frame. The raising of the plants from seed may be recommended as absolutely satisfactory, both as regards the quality of the flowers and the average amount of double blooms obtainable from a reliable strain.

THE BULB GARDEN.

LILIUM GIGANTEUM.

THIS majestic Lily with its wide, succulent, Arum-like leaves, is of great beauty and surprising dimensions when well grown. It is seen at its best when planted in a semi-shaded glade of the woodland where, sheltered from the wind and sun, its stately flower spikes develop freely and become objects of surpassing loveliness. In woods it finds an ideal rooting medium in the light, rich, vegetable soil, which suits it so well.

The plant is not stem-rooting, the large, fleshy roots being produced from the base of the bulbs from which they radiate in all directions a little way under the surface, hence deep planting should not be practised.

There is no advantage in planting very large bulbs; in fact, better results are often obtained when medium-sized bulbs are planted, which will not usually flower until the second year. Although large bulbs may flower the first year, it is seldom that they produce flower stems of large dimensions, as the plant, being dependent on one rooting system, cannot sustain them. Longer planted bulbs build up a more extensive rooting system, which results in full development of the flower stems.

The rapidity of growth of this Lily is remarkable; well established and vigorous plants frequently send up spikes 10 feet to 12 feet and sometimes even 14 feet in height in late June or early July. These carry as many as 15 or 20 trumpet-shaped flowers, each 9 or 10 inches long and 5 or 6 inches across at the mouth. The opening bud is greenish-yellow, and the fully expanded flower pure white, showing a reddish-purple band inside. The fragrance is powerful and delicious and reaches far in the still summer evenings when this beautiful Lily looks at its best. The flowers last only a short time, but with their passing the beauty of the plant is not gone. The leaves remain in perfect condition until autumn, while the seed-pods, resting at the top of the huge stems in an erect position, are themselves objects of striking beauty.

Propagation is readily effected by means of offsets, which may be found in abundance clustered around the base of the flowering stems. These should be lifted and replanted in November in ground that has been thoroughly prepared.

It is also easily increased from seed, and under favourable conditions self-sown seedlings frequently develop and reach maturity. The raising of plants from seed is, however, a slow process, as it is 6 or 7 years before the seedling plant reaches the flowering stage. *W. Auton.*

TREES AND SHRUBS.

RHODODENDRON PINK PEARL.

FOR producing a good, permanent effect in a garden no evergreen shrub can surpass the Rhododendron, no matter whether it be used as a single specimen or groupel in beds or elsewhere; and this is especially true of the better hybrids, one of which, Pink Pearl, is illustrated in Fig. 7. Several years have elapsed since the subject of this note first captivated the gardening world, but it still

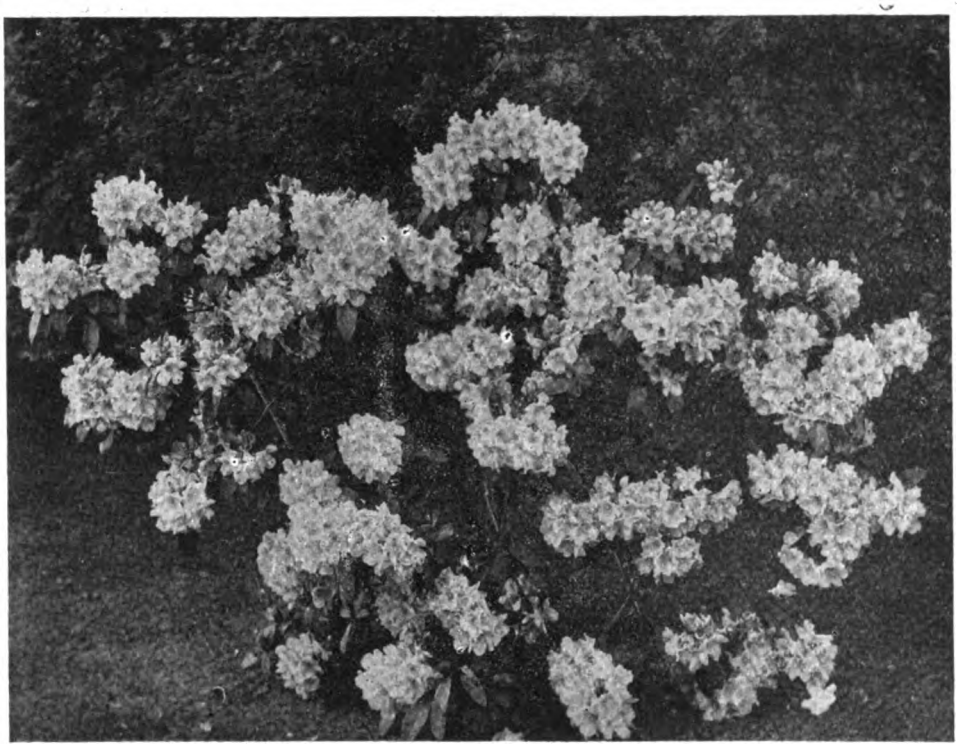

FIG. 7.—RHODODENDRON PINK PEARL.

stands in the front rank as one of the best Rhododendrons as regards floral magnificence. Its flowers are of a flesh-pink shade, and very beautiful. The plant figured is growing in the loam of a Middlesex garden, where I formerly had charge, thereby once again disproving the old notion that peat is necessary to the successful cultivation of Rhododendrons. Leaf mould only was added at planting time. *C. Turner, Ampthill Park.*

WISTARIA MULTIJUGA.

WISTARIA multijuga and its varieties are usually supposed to be less floriferous in the young stage than W. chinensis, but this is not necessarily the case. Our plant of W. m. rosea was planted against a wall in 1908, and has flowered freely every year since 1913. This year it is bearing at least two thousand racemes, most of them 2 feet in length and upwards, thus making an object of striking beauty. Wistaria multijuga is generally considered to be a variety of W. chinensis, but Bean, in *Trees and Shrubs Hardy in the British Isles*, makes them distinct. Not only are the racemes longer in W. multijuga, but the leaves have more leaflets and the time of flowering is later. This plant is the Wistaria usually depicted in Japanese landscape scenery, and not W. chinensis, as is commonly supposed. *W. Auton, Pyrford Court Gardens.*

FURTHER CONFESSIONS OF A NOVICE.

THE imaginative Mr. Wells has suggested—if I remember aright—in one of his essays, that the State should provide text-books in all branches of knowledge. In order to be authoritative, and, indeed, perfect in wit and wisdom, he recommends that there should be a sort of endowment of pedagogic motherhood; in other words, the State should select each writer and pay him for his pains of production. If and when the recommendation is adopted, I hope that one of the first books to be provided will be a new and revised edition of Lindley's *Theory and Practice of Horticulture*. Every gardener knows this remarkable book. It occupies, no doubt, a conspicuous place in every bothy library, and its well thumbed pages testify to its frequent service. Yet, since the time it was written, horticultural and botanical knowledge have progressed, and the new facts deserve to be incorporated in a new edition. It is to be feared, however, that the State might have some difficulty in finding an author. Bayley Balfour, great as a gardener and a botanist, could have done the work surpassingly well; but he, alas, is no more, and a great fund of his knowledge perished with him. Perhaps under the Palms of Kew or in the quiet groves of Wisley there may be found, as yet mute and inglorious, some young gardener who, "exhausting thought and living knowledge with each studious year," may eventually confer this boon on a world of expectant gardeners. Then the new edition will appear as terse, authoritative, sure and illuminating as the old.

These aspirations are prompted by my own failure to take full advantage of the sweet uses which Shakespeare claimed for adversity. I have watched the plants of my garden during the last two months of drought and shrouded skies, and noting their curious behaviour, I have turned to books on horticulture for enlightenment, and have found none. They are doubtless excellent books; but they appear to be written by winners for winners and not for losers like me. In the garden which the authors tend nothing ever dies except annuals. With proper precautions Conifers transplant as readily as Anglo-Saxons; a suitable insecticide applied with a suitable syringe will get rid of green fly and caterpillar, and a light dressing of nitrate of soda will provoke the most coy among seedlings to exuberant and fruitful growth. It is evident that these happy books are not written for years such as the present. They are for Paradise or the Cornish coast, and not for inland places, in the present year of grace.

The new edition of Lindley would, contrariwise, tell me what none of the books on botany or gardening seem able to do; why such a season as the present should have produced such strange effects. Why, for example, Lavender—to name only one of many plants in like case—should be no more advanced than it was a month and more ago, blossom bud and flower-stalk all ready, but no sign of bloom! Why Plums, which set well, gave up trying at fruit production or even leaf production, at the first early, unkind touch of aphis! Why Broad Beans are tall and full of large pods, the contents of which are so puny as to make the pods not worth gathering! Why there are no Pears except here and there on walls; whereas of Apples, despite aphis and caterpillar, the promise still abides of a fair crop! Why, on the contrary, many plants, tree Lupins, and herbaceous kinds, Pentstemons, Shirley and Oriental Poppies, Violas and Pansies should be flowering as though all was for the best in the best of all possible worlds! Why Irises should have bloomed so sparingly in certain gardens, and Darwin Tulips so abundantly! Why Polygonum baldschuanicum should be in full blossom a month before its time, and why, saddest of all, the florists' Roses should be so shy of flowering and yet some species, the Banksian Rose, Rosa Moyesii, R. Hugonis, and the wild Rose, despite black spot, aphis and rust as thick as brickdust on their stems, should have flowered or be flowering as surely as the arrival of the half-yearly demand for income tax! Penzance Briars hold a mid position. Most of these delectable hybrids are a mass of bloom, but here and there one has missed and bears a moribund look, though in neighbouring gardens I learn that whole hedges of them are, or appear to be, dying.

These are some of the mysteries the elucidation of which would comfort my soul and shorten the period of my gardening novitiate. Sunshine, as we all know, has been sadly deficient and the rainfall below average. Soil temperature is a sluggard unduly late to rise, and there, it may be, is the secret villain of the piece! If only we could watch the growth of the roots of plants what a knowledge might we not gain of the behaviour of the stems and leaves and flowers! I am fain to think that whereas in ordinary seasons the roots of plants are well behaved, obedient servants to the aerial parts, in aberrant seasons there are subterranean, silent, and often fatal insurrections. The roots throw off their subservient allegiance and live for themselves alone. These are, however, but the temerarious and dubious speculations of the untrained mind. I must wait for the new Lindley to illuminate those dark places of natural history. *A. N.*

SEED AND PLANT COLLECTING IN NEW ZEALAND.

(*Concluded from page* 7.)

FERNS are not plentiful, there being at most a dozen species, and these include no true Tree Ferns, which one expects to find in all parts of New Zealand. Polystichum vestitum, related to the British P. aculeatum, is very common; at times it has a small trunk. Hypolepis millefolium is abundant. It dies to the ground in winter, and is easily cultivated in any shady garden. On rocks in the shade Asplenium Trichomanes—identical with the British plant—is occasionally to be found, but on the drier rocks is the cupressoid shrub, Helichrysum Selago, interesting for the garden and resembling a whipcord Veronica.

The next few days were spent according to schedule. On the Wednesday we explored the main shingle fan at the base of The Sugarloaf, and skirted the shores of Lake Sarah, a pretty sheet of water of glacial origin. On the way we crossed a good deal of tussock grassland, where we found the ever-present Blechnum penna marina; Scleranthus biflorus with its yellow cushions; Viola Cunninghamii with its pretty white flowers; Plantago spathula; Gaultheria depressa with large, white berries; Leucopogon Fraseri with yellow drupes; the charming New Zealand Bluebell, Wahlenbergia albomarginata; Celmisia longifolia, a rosette plant; Brachycome Sinclairi, a pretty little Daisy; and Gnaphalium Traversii, an elegant alpine with white leaves. The close-growing Gnaphalium Mackayi of the higher levels is even better for rockeries. Celmisia spectabilis is occasionally found on these lower levels, but to see it at its best one must go up 1,000 or 2,000 feet from the plain, and, although the expert almost despises C. spectabilis when he compares it with other noble Celmisias, *e.g.*, C. Traversii, C. coriacea, C. Armstrongii, C. Hookerii, C. lanceolata, C. petiolata, C. holosericea, and C. Petriei, yet to me it was a glorious sight to see thousands of this plant, with their dark green, shining and circular cushions or mats of foliage in flower, or with Thistle-like heads of seed. We found that one of our native bugs of most objectionable odour was using the seed-heads as a breeding-place and rendering the seed useless. In the same locality as the Celmisia grew a dainty, cut-leaved, yellow Buttercup, Ranunculus Enysii.

On the banks of streams, in shady places, we found the charming Veronica Lyallii, forming broad mats.

The next day we crossed the rivers Cass and Waimakariri by bridges, and spent a pleasant time in following up the bed of the Hawdon, a tributary with forest-clad slopes on both sides. Here we found several species of Raoulia; also Coriaria lurida with Fern-like leaves and black fruit; the yellow-flowered Clematis australis; C. marata, various species of Acaena; Carmichaelia uniflora, a dainty dwarf shrub making large patches; Veronica Bidwillii, Cyathodes Colensoi; and also the Ferns Asplenium Trichomanes, A. Richardi with its finely-cut, Carrot-like leaves, and A. flabellifolium—here erect, not drooping as in forests.

Perhaps the best find we had was the extremely rare Myosotis uniflora, which is a cushion plant of soft leaves with cream-coloured flowers. On the sandbanks we found some nice clumps of Viola Cunninghamii, of which Farrer writes rather disparagingly. My own opinion is that it is a charming plant. Dr. Cockayne informs me that Viola filicaulis, a forest species, forming wide patches in wettish places, is still prettier, and hardly to be distinguished from its ally V. Lyallii.

On the Friday we visited a swamp to collect Sphagnum moss for packing. We also gathered seed of Nertera Balfouriana, which was covered with its orange-coloured, Pear-shaped drupes. It is a great acquisition for the rock garden. Also growing on the margin of the swamp were Viola Cunninghamii, Mazus radicans, its flowers purple and yellow; the curious rosettes of Plantago triandra; and Wahlenbergia albomarginata, with, of course, a plentiful supply of Blechnum penna marina.

During the afternoon of this day we ascended the Sugarloaf, a mountain guarding the station, to a height of about 4,000 feet above sea level. Here I saw the Celmisia already mentioned, and gathered seed, also that of Aciphylla Colensoi. On the most stony ground was an abundance of the mountain Totara, Podocarpus nivalis. Splendid views of the surrounding valleys and high mountains are to be obtained from here.

One of the noticeable plants of the grassland is Coprosma Petriei, which, if the plants grew upright, would have been respectable shrubs. As it is, they lie low on the ground, no higher than a well regulated turf, while among their dense foliage are tucked away large transparent berries nearly a quarter of an inch in diameter, which on different plants are either pale-blue or port-wine coloured. The port-wine variety should be very effective on the rockery; once established it should grow readily. Other cushion or mat plants found in the district are the numerous species of Raoulias, which are silvery in colour, but the rather rare bright-green cushions of R. Haastii are abundant also. These New Zealand cushion-plants are of such great diversity that a bed composed of the different coloured species should be something to talk about.

Gathering some of the seeds gave us trouble, almost the worst plant being Discaria Toumatou, known in New Zealand as the "Wild Irishman." It is a dark-coloured shrub that grows in this district to a height of six feet. It is armed in all directions with stout, sharp spines about 1½ to 2 inches long, under which the seeds are sheltered. If the seeds are not dead ripe, each capsule has to be picked by hand. The plant may be interesting, but to gather the seeds is irritating, nor is it pleasant to walk through its dense thickets. The seeds of the dioecious Aciphylla Colensoi are even more troublesome to gather, as one cannot attempt to hand-pick them. I held my Panama hat under the stem while the Doctor scraped the seed off with a botanical trowel. Our harvest of this particular plant was abundant, although we found only two plants with ripe seeds. This handsome, Yucca-like plant is known in New Zealand as "The Spaniard." Dr. Cockayne was much interested in finding at 3,000 feet altitude a patch of apparently hybrid Veronicas on the unbotanised Mount Misery, living specimens of which he is reserving for future study. The species suspected are V. monticola, V. carnosula, and V. pinguifolia.

It would be of interest to the British admirers of Veronica Traversii to see it growing "on its native heath," i.e., hillside, river-terrace, and talus, at from 1,000 to 3,000 feet

Digitized by Google

altitude. In many cases the flowers were over, but the seeds were hardly ripe—though Veronica seeds may be gathered safely before they are quite ripe. In other localities the plants were in full bloom and visible from afar, as was also V. monticola. I was delighted to find large patches of V. Bidwillii, with its pink flowers, in full bloom on stony mountain sides and river-beds. It has smaller leaves than V. Lyallii, and grows under drier conditions.

On the tussock land we found many plants of Veronica pimelioides var. minor, a very pretty dwarf mat-forming variety with a blue flower—the much taller type of the species is restricted to dry rocks in the driest parts of New Zealand. Growing on the same flat in clumps of about 6 inches or 8 inches through, was the white Gentiana serotina in full flower. Gentians here have the reputation of being bad "movers," so we refrained from disturbing the different graceful and charming specimens to be found, but I am trying to make arrangements to secure some seeds later on.

Packing the plants was interesting. All soil is removed, and the roots wrapped with damp Spaghnum moss and tied with strands of Phormium tenax, a plentiful supply of both materials being found within easy distance of the station. Phormium, or Flax, as it is called, split into strands as thick as ordinary twine, is a very good tying material if used while green and supple.

The season was too early for the seeds of many species, but we gathered seeds of over fifty, and I brought away nearly the same number of plants, including Myosotis uniflora and Ranunculus Enysii. I returned to Wellington with the plants, some of which have been sent to the Wellington Botanical Gardens, and the remainder, which I have planted in my garden in the open or in boxes, appear to be doing very well. *Herbert Baillie, Public Library, Wellington, New Zealand.*

NOTICES OF BOOKS.

Plant Names.

THE author of *Plant Names** makes no attempt at a dictionary of plant names, but to make a readable book with a view to educate his readers, and so interest them by explaining the meanings of words derived from Latin, Greek, Arabic, Persian and English words derived from Anglo-Saxon and some other sources. The work is arranged in thirteen chapters, with an index, running to 93 pages. For instance, there are chapters on names whose meanings are not known, medicinal names, fancy names, classical names, names from place of origin, etc. The names that have no meanings for us are those adopted from Theophrastus or other old authors, who did not explain them, but used them for plants which have not all been identified with certainty. Under fancy names the author quotes the Judas Tree, and says it was supposed to be the tree on which Judas hanged himself. Other writers state that it was simply the Tree of Judea. Under names from use, two explanations are given for Capsicum, one being from Greek *kapto*, to swallow greedily. A better explanation would be *kapto*, to bite, from its pungency. One cannot always agree with some other explanations, such as Filbert being derived from St. Philibert, and that Polygala comes from its abundance of milky juice, because it has no milky juice. He fails to find a meaning for Cranberry, but that is explainable by the stalk of the flower and fruit being arched like the neck of a crane. Peony is not a good spelling for a word derived from Paian or Pæon. As a rule, however, his explanations are quite orthodox, and the reader who commits the meanings and explanations to memory will have got more than value for the price charged for the book.

* *Plant Names.* By T. S. Lindsay, B.D., Archdeacon of Dublin. London: The Sheldon Press, Northumberland Avenue, W.C. New York and Toronto: Price 2s 6d. net.

CANNIZARO, WIMBLEDON.

ON the north side of Wimbledon, abutting on the common, one would scarcely expect to find an estate of thirty-six acres with a large old garden attached, yet such is the case at Cannizaro, purchased during recent years by E. K. Wilson, Esq. There is a good deal of old wood in the policies, some of it neglected and overgrown, but this is being thinned out with the object of introducing choice Rhododendrons, of which the owner is particularly fond; but many other valuable ornamental trees and shrubs are being planted.

During the third week of June I had the pleasure of seeing many of the Rhododendrons in bloom, but some were over and the new growths in their prime of beauty, as in the case of R. decorum × R. Thompsonii. The large bell-shaped, blush and fragrant flowers of R. Loderi (R. Fortunei × R. Griffithianum) were very handsome on bushes 5 to 8 ft. high. Plants of this size are much prized, as few can possess them. Near the house the Azaleas were passing out of bloom, but the orange-scarlet flowers of A. Gloria Mundi were very striking. Pernettya mucronata Bell's Seedling is a variety with red berries. Near a Juglans nigra 70 ft. high were Rhododendron Shilsonii (R. Thompsonii × R. barbatum) 3 ft. high, and R. Combe Royal, a hybrid of R. Griffithianum, 8 ft. high, growing freely, and a little further away was a variety of R. arboreum like a little tree, this having been planted many years ago. Very distinct was the glaucous foliage of Pseudotsuga Douglasii glauca.

A winding path through the wood (looking like an old watercourse) was being cleared of undergrowth, and already was largely planted with choice hybrid Rhododendrons. The soil here, geologically, is old valley gravel laid down anciently by the River Thames, but being unfossiliferous its age cannot be determined. The fallen leaves of years past had covered the soil with a peaty deposit, and this, when trenched, makes an excellent medium for Rhododendrons. Some of them noted were R. Hodgsoni, with striking silvery leaves of large size; R. Broughtoni aureum, still in full bloom; R. Falconeri, with its massive leaves, rusty underneath; R. Lady Clementine Walsh, rose to blush, with blotches of yellow-brown spots; R. Luscombe's Scarlet, 10 ft. high; and the beautiful old R. fastuosum flore pleno, with semi-double, rich mauve flowers. When completed this will make an attractive Rhododendron dell, for the above are only a few of the kinds already planted.

On a piece of ground sheltered from the north, a large oval bed has been trenched, liberally mixed with peat and planted chiefly with American shrubs. Though this has been done since last autumn the plants are mostly all established and some of them flowering, including Kalmia latifolia, Zenobia speciosa, Ledum palustre, Vaccinium pennsylvaticum, and various species and varieties of hardy Heaths. In the more open spaces choice and uncommon or rare trees are being planted. For instance, the new hybrid Poplar, Populus generosa (P. angulata × P. trichocarpa) was making vigorous growth as is often the case with trees of this origin. It was raised by Prof. A. Henry. Crataegus Carrieri is a handsome Thorn of unknown origin, and showing both the flowering and the fruiting stage. Pyrus latifolia is also showing its fruits; and Nothofagus obliqua is one of those rare small-leaved Beeches from Chili. The giant of the wood is a common Beech, about 100 ft. high, with a girth of 14 ft.; the straight trunk is very imposing.

FIG. 8.—PRIMULA MARVEN (SEE PAGE 23).

Passing through the houses in company with the gardener, Mr. Allison, who is very enthusiastic in his work, whether in the open or under grass, some well-grown perpetual-flowering Carnations were noted, including a houseful of Triumph, Carola, etc.; Clarkia Firefly and Sutton's Scarlet were bright; and Fuchsia Scarcity was notable for the size of its flowers. The trees in the Peach house were young, yet carried what seemed like excessive crops, especially in the case of Nectarines Cardinal and Lord Napier, and Peaches Rivers' Early York and Kestrel. Most of the large fruits of Nectarine Early Rivers had been gathered.

The kitchen garden was well furnished with vegetables, and Cabbage Flower of Spring had been supplying the kitchen for some time. A good breadth of Potato May Queen had been dug some time previously. At the bottom of the garden two old and neighbouring trees of Cox's Orange Pippin Apple and Cox's Pomona were laden with fruit.

The borders round the vegetable garden, alongside the paths, were filled with herbaceous plants, and, where wide, the front and other salient parts were planted with Violas and annuals in panels of a variety. Nemesia strumosa Suttoni, Phlox Drummondii, Antirrhinums, and many others were just beginning to show their rich colour. Some flowers of Viola Moseley Perfection measured three inches across either way, and this variety had been in bloom since February. Near the house were beds and borders on the grass all filled with flowers, but the shades of evening made inspection difficult. On a wall, however, I noticed a specimen of Eucryphia pinnatifolia, 14 ft. high, which must have been there for many years. *J. F.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 5, Tavistock Street, Covent Garden, W.C.2.

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters, and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 5, Tavistock Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

HISTORY OF THE OXFORD BOTANIC GARDEN.

ON the occasion of the celebration of the tercentenary of the Oxford Botanic Garden, Sir David Prain, F.R.S., reviewed the history and work of this celebrated establishment, and we now have the pleasure of publishing his address:

It is no light responsibility to take the place occupied by Mr. Edward Dowson on St. James's Day in 1621. I ask for your forbearance while attempting to perform the task assigned to me. I feel encouraged in making this request because the invitation to undertake the duty is a token of the feeling entertained by this old and famous garden towards the two sister institutions it was my privilege to serve for five and thirty years. The gardens at Kew and at Calcutta are grateful to the Curators of the Oxford Botanic Garden for their kindness. Both of them, I know, reciprocate their feeling most warmly.

When Mr. Dowson and Dr. Clayton spoke here in 1621 they intimated to their hearers the hopes they entertained. If their task was that of prophecy, ours is that of assessing the achievements of three hundred years. This garden, we are told, "was primarily founded for a nursery of simples and that a professor of botanicey should read there." This was written about 1668, long after Mr. Dowson and Dr. Clayton had spoken, yet before the professor they wished for had been appointed. But by 1659 we know that your "excellent gardener," the elder Mr. Bobart, had made this place such a "nursery of simples" that it was already comparable with the best "of the public physick gardens beyond sea." But we know besides that by 1648 Bobart had surpassed the hopes of those assembled here on July 25, 1621; if the Oxford Garden was but a "physick garden" in name, it was already a "botanic garden" in fact.

The story of this garden can only be appreciated by those who realise what a botanic garden is and does. What a botanic garden is we here can understand; we have only to look around us. What a botanic garden does is not always understood; if a definition be demanded, a botanic garden is "an institution in which gardencraft assists botany to increase and to improve natural knowledge."

Where the amenities have been attended to as assiduously as we see here, some find it difficult to distinguish a botanic garden from a public park. Where such cultural skill is displayed as we find in this place, others conceive that a botanic garden must be guided by horticultural purpose. However natural these ideas may be, both are mistaken; a botanic garden serves botanical ends.

Throughout her history, botany has derived her material and her inspiration equally from the garth and the waste. A millenium ago, even in a region so rude as Europe, she found in monastic closes beside the *hortus olitorius*, an *hortus herbarius* stocked with herbs of faith and grace which enabled her to study the characters and qualities of plants. Beyond monastic precincts, however, she found the study of wild herbs as important, and was led to form an *hortus siccus*, which enabled her to master the characters of its components. Her knowledge of their qualities, however, remained imperfect, and to remedy this defect she formed an *hortus vivus*.

If the nurture of domesticated plants require wary tilth, that of the wildings of moor and fen and forest taxes still more the wit of gardencraft. This wit has always been ungrudgingly at the disposal of botany, and nowhere more freely than at Oxford. It was here that gardencraft devised for botany an early heating apparatus; it was here that the first wooden greenhouses seen in England were built. Here, as elsewhere, botany has owed to the help of gardencraft some of the progress made in the study of plants as living organisms.

Botany is a modest science, like Chaucer's scholar, glad to learn and glad to teach. She does not teach the gardener his craft; she observes his labours and learns. In return for the help she receives, she puts at the disposal of gardencraft what she knows regarding the plant as a vital mechanism in the hope that she may enable the gardener to grasp the principles that underlie his practice.

The object of gardencraft is the thrift of the plants she handles. This constancy of purpose is independent of incentive and method. We do not question the apothegm of Bacon on gardens, but we remember that his remarks apply to gardens whose creation was reserved for ages grown to civility and elegancy; gardens whose care involves the mutual adjustment of two sometimes conflicting ideals—the constraint of nature and the concealment of art. We remember, too, that there was another incentive to the creation of gardens, powerful before ages of civility and elegancy had set in. That incentive is included in the edict that man must eat his bread in the sweat of his face. The resulting activity found two outlets; in efforts to maintain health and in attempts to alleviate sickness. In both instances physical comfort rather than intellectual pleasure was the ruling impulse.

This explains why the origins of botanical gardens have not always been uniform. Here in Oxford in 1621, as often elsewhere in Europe, a "nursery of simples" was established with the technical object of assisting the physician to minister to the sick. But by 1648 the elder Bobart had made it a garden of civility; by 1670 it had become a place of botanical instruction; by 1690 the younger Bobart had made it a centre of distribution of useful plants. At Kew the original purpose was such as Bacon indicates; the distribution of useful plants dates from 1772; the establishment of scientific activity there dates from 1841. At Calcutta a technical garden, originally established in 1786 to further the interests of traffic and industry, underwent a similar development; in 1793 it became a scientific institution. But in all these cases the assumption of new duties proved compatible with the retention of old; while, whatever the original purpose of a garden such as this one at Oxford may have been, it was only when it became a scientific institution that it proved adequate to a purpose higher than bodily well-being or mental refreshment. Even when it was in a position to serve the purpose of intellectual development it remained as dependent as ever on the aid of gardencraft.

Botany has been less constant of purpose than gardencraft. When this garden was founded botany was a technical art devised to further mnemonic ends. When Dillenius was professor here a century later, his friend Boerhaave still defined botany as the pursuit which enabled its followers to identify and to remember their plants with most ease. At late as 1659 botany had not come into use in Oxford. The favourite pursuit was phytology, which Dr. Lovell has defined as "the art of knowing and finding out the temperature, virtues and use of plants, as serving to the curation or sustentation of the body." Not until 1750 was botany treated as a self-contained science concerned with the systematic and philosophical study of the vegetable kingdom. But there was still a singular limitation. The phytology studied at Oxford in 1659 was an older pursuit than the botany Dr. Morison was appointed to teach in 1669. In 1750 the botanist was a phytologist; the phytologist need not be a botanist. Those only were botanists who could designate plants as well as determine them. Philosophical students of the "mystery of sex" were botanists. But philosophical students of the structure and growth of plants; the custodians of gardens who cultivated plants; and those who used plant products, though they were phytologists, need not be botanists. A century later saw an attempt to reverse this connotation by limiting the designation "botanist" to the vegetable-physiologist.

The Oxford Botanic Garden is a place of many pious memories, a review of which may serve to illustrate what a botanic garden does.

First in time as in other regards comes that of the Earl of Danby, to whose enlightened interest in natural knowledge, especially such of it as may be improved for use by medicine, this institution owes its being. To the Earl the garden was indebted for the selection of its first custodian, that "excellent gardener and botanist," the elder Bobart. The first Danby Professor of Botany was a gift of the Sovereign who granted its charters to Oxford's "Invisible College." Dr. Morison's memory lives in his published works and in the *hortus siccus*, prepared under his supervision by the younger Bobart, which is among this garden's most precious possessions.

Both of the Bobarts were in their day the subject of some criticism. The elder, your custodian of the garden, was regarded as being too much of a botanist; the younger, who succeeded Morison as your professor, was esteemed too much of a gardener. We, with our better perspective, recognise in these reflections the highest compliment that could be paid to either. But we find that both were paid, just as unconsciously, another compliment nearly as great. John Evelyn, in 1664, found "no extraordinary curiosities" when he visited the gardens; Von Uffenbach, when here in 1710, remarked that there were "few rarities." Those who have been in charge of botanic gardens see in these remarks conclusive evidence that neither had yielded to the temptation, to which keepers of botanic gardens so often succumb, of wasting time, resources and space in trying to keep alive plants that cannot be made to thrive.

In 1728 this institution found another generous benefactor in Consul William Sherard, who made the garden the gift of an *hortus siccus*, which placed Oxford on a footing of equality with the best-equipped European University of the time. He added priceless books to the garden library, and valuable plants to the *hortus vivus*. He endowed the Sherardian Chair and, greatest gift of all, persuaded the University to invite Dillenius to occupy it.

Sir James Edward Smith expressed an unfavourable opinion upon the influence of Dr. Humphrey Sibthorp, of Magdalen, who succeeded the eminent Dillenius. Yet Oxford owes to him the inestimable gift of a distinguished son, Dr. John Sibthorp, of Lincoln. To the younger Sibthorp, scholar and explorer, Sherardian professor and generous benefactor to the University, we owe an early demonstration of the essential difference between botanical survey and botanical excursion; to him also we owe the "discovery" of Mr. Ferdinand Bauer.

Perhaps Dr. Williams, who followed the younger Sibthorp, hardly did justice to himself. Others have not always done justice to him. A distinguished scholar, he must have been also a good botanist. Though he published nothing, he enjoyed the friendship of the first president of the Linnean Society. He "discovered" the elder Baxter, whose work as custodian of the garden was as excellent as it was untiring.

Digitized by Google

Under circumstances so distressing as to be almost unbearable, he strove to keep the garden above water in more senses than one. No higher estimate of his merits can be conceived than that recorded by the foreign critic who, in 1824, found the Oxford Garden "inadequate to the purposes of botanical instruction in the present state of science." The Oxford Garden was starved; the professor was alive to the fact, but he was not well endowed with our national gift of mendicancy.

Dr. Daubeny, the brilliant successor of Dr. Williams, added that gift to his other accomplishments. He was thus able to extend the garden, to protect it against flooding, to reorganise the living collections, and to render them adequate to the purposes of botanical instruction. But Dr. Daubeny, while substituting for squalid poverty a state of elegancy which provided Oxford with a setting appropriate for assemblages such as this, did not attract Oxford undergraduates to the study of the *scientia amabilis*.

Just fifty years ago, in the days of Dr. Daubeny's successor, the Oxford Garden sought the advice of her younger sister at Kew as to a proposal to abandon the associations of a quarter of a millennium. The younger garden, with practical experience as her guide, was able to satisfy her senior that the proposal, if carried out, must cost more than the provision *in situ* of the improvements urgently called for.

A decade later Oxford repeated the experiment of 1669. Though equally successful, it could not be prolonged; Dr. Bayley Balfour felt it his duty to respond to the claim on his services made by his own *Alma Mater*. To the deep grief of the science he loved, these services, whether at Glasgow, at Oxford, or at Edinburgh, are now among our pious memories. Short as Balfour's stay at Oxford was, he was able to assist by precept the eminent men charged, after his departure, with the interests of this garden. By his example at Edinburgh he may still assist the Oxford Garden. Before laying down duties which eventually undermined his health, Balfour provided Edinburgh with the equipment "adequate to the purposes of botanical instruction in the present state of science." That equipment he placed in the only position appropriate to its reception in a University of the highest rank.

It would not be proper to make detailed reference to the part played in its history by those, happily still with us, who have served or who still serve this old and famous garden. This distinguished School of Botany owes them unstinted thanks for good and faithful service. They merit at our hands all the encouragement to be derived from our most fervent wishes for the continued welfare and renown of the Oxford Botanic Garden.

HARDY FLOWER BORDER.

TEUCRIUM FRUTICANS.

IT is some time since I came across the shrubby Germander, Teucrium fruticans, and even in some south of England gardens I have seen lately, where I expected to find it, there was no specimen of this pretty plant. Its absence from northern gardens is less surprising, seeing that it is admittedly tender. I grew it myself for a number of years against a south wall and on a raised bank, and it stood our winters pretty well near the Solway; but on one or two occasions it was badly cut by spring frosts, which are particularly troublesome there. Ultimately it was lost in my removal to another house and garden, and has never been replaced, seeing that I am now less favourably placed for the cultivation of the more tender subjects. It is a plant which may be of value to growers in the south and by the sea, who may desire a graceful Germander, whose book stature is from two to three feet, the latter being about the height it reached with me. It is a distinct subject, with branching stems carrying oval-pointed leaves, which are quite silvery above and white beneath. The flowers are practically stemless, and are of a charming shade of lavender. It is a plant with no pretensions to showiness, but has a most undeniable claim to true elegance and charm. It should have a warm position and a dry, well-drained soil. Propagation is effected by cuttings under glass. It is sometimes known as T. latifolium. *S. Arnott.*

THE ALPINE GARDEN.

RANUNCULUS LYALLII.

RANUNCULUS LYALLII is one of the most striking plants of New Zealand's sub-alpine flora, and considered to be the most magnificent member of the whole genus. This beautiful plant, with thick, saucer-shaped leaves 12 inches in diameter, and snowy-white flowers 2 inches to 3 inches across, carried in heads on erect stems, presents a striking picture to travellers in some parts of the South Island, where, during the months of February and March, it is seen blooming in all its glory, often in masses an acre or more in extent.

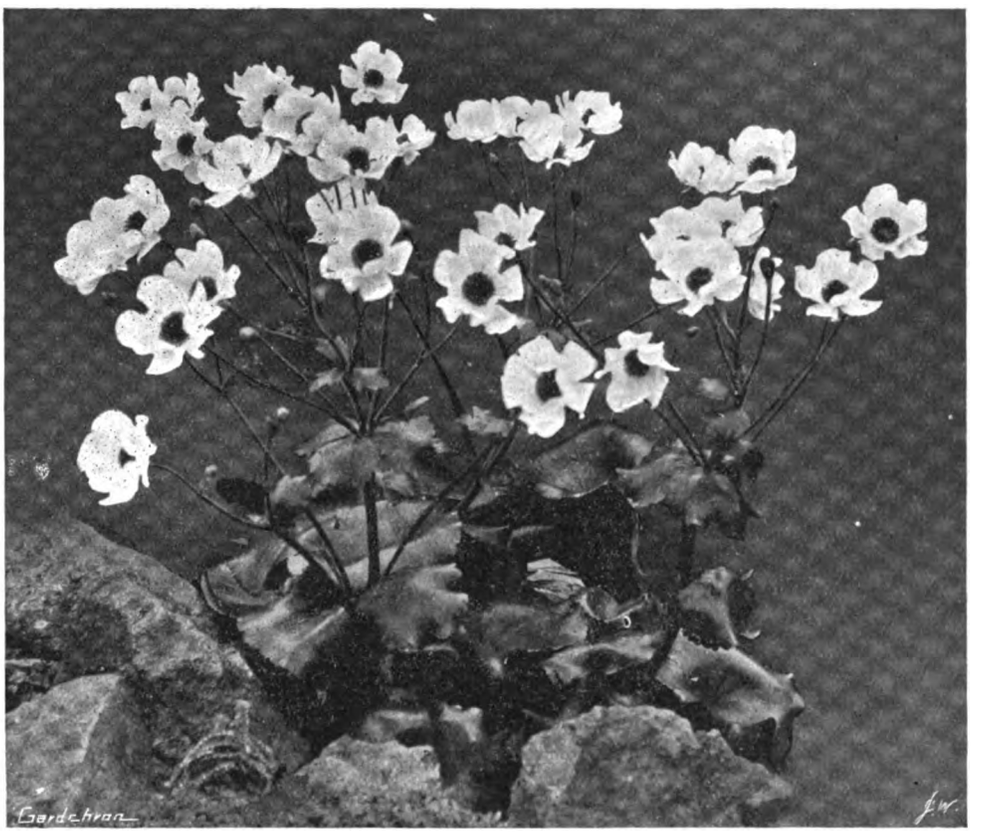

FIG. 9.—RANUNCULUS LYALLII IN NEW ZEALAND.

It is rather unfortunate that this noble plant does not take kindly to cultivation, for it is well worthy of a place in all gardens. It may be increased by division of its stout root-stock, or by seeds; but sometimes the seeds are slow in germinating and often fail.

Considering that it grows at an elevation of from 2,000 ft. to 5,000 ft., and for some weeks is covered with snow, it enjoys extremes of both heat and cold, and I find that the best position for its successful cultivation is a sunny pocket on the rockery, where the soil is always moist and at the same time well drained, with a liberal supply of sand and gravel about the roots. Leaf mould may be added; but on no account should manure or artificial fertiliser be used.

The illustration (Fig. 9) represents a plant growing in my own garden at Dunedin, New Zealand, nearly at sea-level. I understand that the cultivation of R. Lyallii in this country is a difficult and uncertain matter. This is probably due to the difficulty of obtaining strong, healthy plants, more than to any adverse climatic conditions. The same difficulty also attends its cultivation in the gardens of New Zealand. *James A. McPherson, Kew, Surrey.*

PRIMULA × MARVEN.

IT is interesting to read in the *Gard. Chron.* of May 26, p. 291, that Primula Marven (Fig. 8) was flowering in the Glasgow Botanic Garden. This all too brief reference brings to mind one of the most exquisite of all hybrid Primulas. A few weeks ago it was flowering here to the admiration of all who saw it. The plants were in cold frames, and it is easy to picture what a real gem this Primula must be in a rock garden where rare and choice plants are cherished.

It may not be generally known that P. Marven is a garden hybrid raised by crossing P. venusta with P. marginata. It is in every way worthy of its beautiful parents. Its name denotes its origin. The seed parent, P. venusta, is itself a natural hybrid between P. Auricula and P. carniolica, found in the very remote and lonely wooded hilltops in the Idrian ranges. However, P. venusta is particularly well known in gardens, and, like some other Primula hybrids, it seeds freely. In his paper on "Primula Hybrids in Nature," at the Primula Conference of 1913, the late Mr. Reginald Farrer, writing of P. × venusta, states:—"The plant is fertile of secondary crosses, and, pollinated by P. marginata, has yielded the beautiful P. × Marven, so close in habit and style to the purple pubescens called decora. Those hybrids, of course, have the splendid constitution of P. Auricula."

Although P. × Marven has been in cultivation for several years, it is still a scarce plant in gardens, and it is likely to remain so, as it is slow to increase. The flowers are reddish-purple with white, powdery eye. It carries upwards of fifteen flowers in a head and is less than six inches in height. All the plants I have seen are "pin-eyed," and it would be interesting to hear if a thrum-eyed form is in existence. The leaves are dentate and show the white margin characteristic of the pollen parent, and last, but not least, it possesses the precious charm of strong delicious fragrance. *Herbert Cowley, Tunbridge Wells.*

RHODODENDRON INSIGNE.

As one who was fortunate enough to see R. insigne flower this year for the first time after anxiously watching for it for several years, I can vouch for all the good things written about it by Mr. Grove on p. 351 of your issue of June 23, Vol. lxxiii. Evidently under Wilson's Number 1339 seed was sent to Kew in 1911, and half-a-dozen plants are now growing well there. The size of plants varies from about 12 to 18 inches in height, and more in diameter; most of the branches are near the surface of the soil. The largest plant has upwards of 40 growths. The habit and general appearance of the plants are alluring, even in the absence of flowers. The younger branches and the under-surface of the leaves are covered by the most clean and silvery indumentum I have seen; the underside of the midrib and main veins are smooth, and the upper surface of the leaves is a particularly bright green.

As the leaves develop they become thick and firm, broadly channelled and the venation is pronounced; they remain on the branch for four years or more. The beautiful silvery under-surface of the leaf turns a burnished brown after the first year. The largest leaves are upwards of 3½ inches by 1¾ inch borne on a stout petiole; some of the leaves have a bulge on one side which gives the leaf apex a curve, but the majority are oblong-lanceolate.

The inflorescence was wrapped tightly in a hard and distinctly round winter bud which nestled conspicuously among the terminal leaves. The first flower opened on May 25; the buds were deep rose and opened a paler colour. Some flowers have six lobes, but the majority have five; the insides of three segments are lined and spotted with deep purple. The seed vessel is undeveloped at present, but it is clearly seen to be 8 or 10 valved, covered by a brown tomentum.

R. insigne suggests an alpine R. arboreum, or an affinity with R. argyrophyllum, but it is different from both. I have also compared R. insigne with R. Delavayi, R. argyrophyllum var. hypoglaucum; R. Ririei, R. floribundum, R. Hunnewellianum and R. Thayerianum, and to this last named there is a moderate approach in the foliage. R. Thayerianum is far more erect and its leaves much longer, with somewhat the same silvering, and they remain on the branches for a considerable time—five years or more.

Like many other Chinese Rhododendrons, R. insigne has shown slight variations; for instance, one plant is much slower in growth than the rest, and the indumentum is loose and inclined to cover the veins and upper surface of the foliage, and give a cobwebby appearance.

It may interest readers to know that R. insigne when grafted on to R. ponticum stocks unites easily and succeeds uncommonly well, the ensuing growth equalling that of the parent plants. I hope the owner of the specimen so well illustrated in the *Gard. Chron.* took the precaution to assist self-pollination, for I have known new Rhododendrons fail to set seed even after such a precaution. Many of the new and uncommon Rhododendrons produce plenty of good seed, and there are many gardeners who would be delighted with an amount which would cover the point of a budding knife.

I wish there was a more ready means of distributing much of the surplus Rhododendron seed, so that there would be no need to wait so many years before the species are known and available to garden owners and gardeners. Take for an example R. impeditum, let alone R. racemosum, both of which can be grown as readily as Ericas, yet these Rhododendrons are rarely seen in the majority of gardens.

The prices of the new Rhododendrons are too high for most folk, and the small plant insufficient return for the average purchaser with a small purse. *C. F. C.*

MARKET FRUIT GARDEN.

June was a cold, dry month with very little sunshine. The warm, growing conditions that were so badly needed did not come until quite the end of the month. At the beginning fruit trees were plainly showing the effect of unseasonable weather. The leaves of some of the more tender varieties of Apples, notably Cox's Orange Pippin and Allington Pippin, were scorched and brown, and quite a number of them dropped. Spray injury was suspected, but the appearance of the same trouble on control trees left no doubt as to the true cause. Plums were looking very miserable as a result of insect attacks and brown rot. By the close of the month considerable improvement was noticeable. Insect pests had in most cases run their course, and the trees were furnishing themselves with fresh foliage. If warmer conditions continue they should now manage to hold what fruit they have. There is no doubt, however, that the yield of orchard fruit throughout the country, speaking generally, will be light. It is much to be hoped that the remainder of the summer may be warm and seasonable, so as to stimulate the demand and ensure satisfactory prices, which alone can compensate growers for the meagre crop.

Apple Prospects.

Although the crop of Apples in my plantations is not heavy, several varieties have set enough fruit to require thinning. Allington Pippin, Lord Grosvenor, Lanes' Prince Albert, Bramley's Seedling, Worcester Pearmain, Domino, and Beauty of Bath will receive this treatment, at any rate in some blocks of trees, for they are patchy. But what concerns me more than the yield is the probable quality of the fruit. At present it is very backward, but it appears only too likely that quality will be lacking in a good many cases. Much fruit is stunted as a result of aphis infestation of the surrounding leaves, and is not likely to grow to normal size. In other cases Apples are marked by caterpillars or cracked and russeted by the weather. Where there is any choice such defective specimens are removed in thinning. It remains to be seen what proportion of the rest will come to perfection.

Most serious of all, however, is the prevalence of scab. Possibly districts which had a dry May have escaped this disease, but with me it is bad. The varieties that are usually subject to scab have been sprayed twice with Bordeaux mixture, and it is evident that the control has been considerable, in spite of unfavourable weather for the work. A third spraying will be given in a week or so. But other varieties, which with me are generally free from scab, are seriously affected this year. Beauty of Bath and Bramley's Seedling are notable examples. In a cold, wet season it would probably be wise to spray all varieties, though this is unnecessary in normal conditions. Beauty of Bath was included in the second spraying, because the disease had made its appearance on the leaves; but that was too late to prevent a good deal of the fruit from becoming affected.

It is a curious fact that scab is more easily controlled on some varieties than on others. I find that Bordeaux mixture works wonders with James Grieve, Lord Grosvenor, and Cox's Orange Pippin, which are all very subject to scab, but that Worcester Pearmain and Allington Pippin are less amenable to its influence.

Mowing in Orchards.

The work of mowing grass under the fruit trees occupied a lot of time in June. Between the rows of half-standard trees a one-horse mower cuts two swathes, but the rest has to be done by hand with scythes and bagging hooks. The crop was exceptionally heavy this year, owing partly to wet weather and partly, no doubt, to the nitrate of soda applied to all plantations under grass. This was applied in January, the idea being that at such an early date the grass would not be able to make much use of it, and it would, therefore, pass down to the tree roots. One might have thought that, in such a wet spring, such a soluble fertiliser would be washed out of the soil altogether. Evidently there is no risk of this, for the grass has clearly made use of it. The trees also look as if they had received their share, as they are now making plenty of growth.

The heavy crop of grass is now spread over the surface of the ground under the trees, where it forms a mulch, which must do a good deal towards protecting the trees from drought. I am not at all sure that this "sod mulch system, as it is called in America, is not better than the plan of keeping the grass eaten down by sheep or pigs, though it is less tidy, and possibly involves more work. The grass is growing again rapidly, and will have to be mown a second time. In a dry year mowing once is sometimes enough.

Cutting Back Young Trees.

The question whether newly-planted trees should be cut back at once or left alone for a year is still the subject of much controversy. Many years ago both systems were tried on my place, and the conclusion reached was that there was nothing to be gained by delaying the operation, but rather the contrary. After a few years there was never anything to choose between the trees, but pruning in the first year was easier, and usually gave the tree the best start. But the practice of delayed cutting back has been advocated strongly in recent years, and has been adopted by an increasing number of growers; so I thought I would try the experiment again.

Three rows of half-standard Pears were planted in the autumn of 1921. The two outside rows were cut back during the winter. The middle row was left alone. During their first summer the cut-back trees did not make much growth, owing to the dry spring; and I rather thought that the unpruned row would score. In the winter of 1922-23 the pruned trees were again cut back hard, and the others received their first pruning. The latter had, as usual with unpruned trees, made a lot of spurs and fruit buds, so that it was necessary to look low down to find suitable buds at which to cut. Both lots are now making plenty of growth, but the trees that were cut back the first winter are ahead of the others.

There is, of course, nothing conclusive in such an experiment; but it supplies one more piece of evidence that heading back in the first winter is right for my conditions. I have never obtained any evidence to the contrary. I should be inclined to delay cutting back only in the case of trees planted very late, say, in March.

Reversion in Black Currants.

Black Currants are cropping fairly well. The berries are big, but the bunches rather short, owing to the usual "running off" of the end berries. The plantation of older bushes which was thoroughly "rogued" last year to get rid of reverted specimens does not show a serious increase of this trouble. But there is a large plantation of young bushes bearing their first crop. Here reversion is rampant. The sound bushes are carrying fine fruit, but the others have only a few small berries hanging singly or in very short bunches, and are quite worthless. I shall go through them all before the crop is picked, and mark all reverted bushes to be grubbed and destroyed. They will have to be replaced by young bushes bought in, if a sound strain can be purchased, or by cuttings taken from the healthy bushes.

There was a time when Black Currants lent themselves well to rough-and-ready culture as an under-crop in young orchards. That time is passed. Growers must either leave Black Currants severely alone or be prepared to face the reversion problem in earnest. Many are deciding on the former course, which makes it all the more likely that those who carry on and fight reversion will reap their reward. Some growers in Norfolk appear to have taken the lead in this matter. They consider that strain is of even more importance than variety, and they have worked up their own strains. One method adopted is to select bushes which carry the best

Digitized by Google

crops, and take soft cuttings from them in May. These are dipped in an insecticide to kill any bud mites that may be on them, and are then struck in cold frames. In this way a small stock free from "big bud" and reversion is obtained, and from it a large stock of bushes is raised by means of cuttings taken in the usual manner. It is claimed that such bushes do not revert until "big bud" makes its appearance. In any stock it must apparently be expected that reversion will arise sooner or later, so that annual rogueing is essential.

Whether reversion really follows "big bud" is still a moot point. I had rather come to the conclusion that it was the other way about. I have seen hundreds of bushes revert before there was any visible sign of "big bud," but once a bush has reverted it soon falls a prey to bud mite. Whatever may be the connection, if any, between these two troubles, there is no doubt as to the necessity of starting with a stock free from both, and at all times avoiding propagation from reverted bushes. The method of taking soft cuttings from selected bushes seems to be the only way of ensuring this.

THE SILVER-LEAF ORDER.

The alteration of the Silver-leaf Order, making it compulsory to destroy all affected wood by July 15, instead of by the following April 1, is wise. Silvered foliage shows up most distinctly early in the year, and becomes less pronounced as the season advances. If the work is left till the winter there is no possibility of detecting affected wood, unless it is actually dead. The Order apparently requires the destruction of all dead wood, whether caused by silver-leaf or not. There is not the least chance of this being done by the date mentioned in a year like this, when many trees are half killed by brown rot and aphides. Apples are included for the first time in the new Order, silver-leaf having become serious amongst Apples in some orchards. I have had top-grafted Apples affected, but so far not the ordinary trees. *Market Grower.*

HARDY FRUIT GARDEN.

PEACHES AND NECTARINES.

MOST of these trees are carrying very good crops, and to obtain large, highly flavoured fruits the thinning of the crop should not be deferred till after the stoning process. In the majority of cases this important detail has already received attention, but if not there should be no further delay in removing surplus fruits. Peaches may be allowed a distance averaging 10 inches to 12 inches apart—more or less according to the age and strength of the trees, and also the size of the variety. If overcropping is permitted and the growths of the branches are somewhat weak, the tree will be greatly checked for next season's crop. Nectarines may be left more thickly on the trees than Peaches, but if carefully thinned to a fair distance apart, the individual fruits will be far superior in every respect.

All young shoots required for next year's cropping should be trained carefully and made secure to the walls; any that are not wanted should be removed. This work should be done at intervals throughout the growing season. The foliage should be kept free from insect pests by repeated syringings in warm, favourable weather. I usually syringe late in the afternoons, and this work needs to be done thoroughly; the spray should not be applied too vigorously or it will damage the more tender leaves. In this garden rain has not been sufficient to soak the earth down about the roots of the trees, and watering has been necessary. Liquid manure, if applied in sufficient quantity to penetrate the soil to a good depth, will greatly help the fruits to attain a large size; a concentrated fertiliser may also be sprinkled on the soil and washed in with a copious watering, or a good mulch of rich manure may be applied followed by a thorough watering. *H. Markham, Wrotham Park Gardens, Barnet.*

CABBAGE ROOT FLY.

THE larva of the Cabbage Root Fly, Phorbia brassicae, is responsible for much damage in hot or dry seasons. It attacks many members of the Cruciferae, amongst which are to be found many important garden plants, such as Cauliflower, Broccoli, Cabbage, Brussels Sprouts, Turnip, Swede, and Radish. The adult fly bears a general resemblance to the common house fly. It commonly appears about the end of April and in May, and there are usually three generations in the year. The females lay their eggs close to the plant. If available, they use any crack near the plant in order to get the eggs as close as possible to the stem. In about a week the eggs hatch and the young maggots begin to gnaw the outside of the root. As they get stronger, they enter the cortex and finally tunnel up the centre of the stem. When full fed, the larvae pupate, usually in the soil outside, but sometimes in the plant itself.

The first generation of fly maggots causes damage in particular to early Cauliflowers, and to a rather less extent to the early varieties of Broccoli. Brussels Sprouts are attacked only to a comparatively small extent. The second and third generations are not so serious to the gardener, though damage may be done to Savoys and Spring Cabbage.

The damage done to Brassicas seems almost directly proportional to their tenderness and speed of growth. This is seen in the greater attack on Cauliflowers than on Broccoli. The same fact may be observed when comparing early, mid-season, and late varieties of Broccoli. The early-maturing varieties are quick-growing, and are more liable to damage than the mid-season and late varieties.

Lastly, this same difference may be observed in the same variety of Broccoli when grown under poor or good manurial conditions. If grown under poor conditions, its susceptibility to attack is comparatively small; if the reverse, the susceptibility is great. These differences are quite understandable when it is remembered that the young larva begins by gnawing the outside of the plant. If this is sappy, it suits the young larva and damage is done; if it is hard, the young larva finds difficulty in obtaining food.

The effect on young Cauliflowers varies. If the attack is severe and early, the plant flags and dies outright. If the attack is less severe and later, the plant is forced into premature flower, and heads as big as pennypieces are obtained. It is, indeed, probable that most of the premature flowering (bolting) of Sprouts and Savoys is due to slight attacks of this pest, and it is just possible that some of the bolting of Spring Cabbage may be traced to the same cause.

There are three preventive and remedial measures known to secure control.

Probably the most effective is the use of tarred felt discs. These can be obtained from the manufacturers at a comparatively cheap rate, and give very good, though not perfect, protection. When using them, it is necessary to take certain precautions. Firstly, they must be fixed in position around the plants as soon as the latter are put out. This is important, as otherwise the fly may lay eggs before the plant is protected. Secondly, care must be taken that, when hoeing, no soil is put on the disc. If this precaution is not taken, eggs will be laid below the soil on the disc. Thirdly, no leaf stalks must be allowed to pass through the hole in the disc, since it is essential that this should fit snugly round the stem of the plant. Such stalks should be removed before placing the disc in position.

The second control method is the use of carbolic acid emulsion.

The formula is: Hard soap 1 lb., or soft-soap 1 quart; water 1 gallon; crude carbolic 1 pint. For use, this is diluted with 30 parts of water, and half a teacupful is poured round the plant a day or two after planting out. The application must be repeated once a week for a month.

This method has been used commercially by American growers, but has not proved so effective as the tarred felt discs.

A third method is the use of mercuric chloride (corrosive sublimate). One ounce of corrosive sublimate is dissolved in 10 gallons of water, and 2 ounces of the resulting fluid is poured round each plant. This operation is performed four days after planting out, and is repeated at ten and twenty days after planting out. This method has given greater success in America than the use of tarred discs, but it must be remembered that corrosive sublimate is a deadly poison and must be handled with extreme care. Needless to say, no damage occurs to the plants; they are even slightly stimulated by the application. *A. H. Lees.*

MELON CANKER.

ALTHOUGH the Melon is one of the easiest of all indoor fruits to cultivate with success up to a certain point, the plants experience a critical time at the stage when the fruits begin to ripen, and, unless the cultivation has been perfect in every respect, they are liable to collapse as a result of canker at the collar. Unfortunately there is no certain cure for this complaint, but there are certain measures which may be adopted as preventives and partial remedy.

One of the common causes of plants being attacked by canker is growing them in a compost containing an excess of rank manure. The grower should endeavour to build up strong, healthy plants, free from gross or sappy shoots; when the fruits have set and are swelling, the necessary stimulants may be applied in the form of liquid manure. Those who are troubled with canker should admit rather more air than is usual in the house, maintain a steady bottom heat, and not cut the laterals too close to the stem at the base, as it is at that part that the canker always appears.

Cankered Melons may have a casing of Portland cement placed about the cankered part to prevent collapse and allow the sap to circulate; this simple provision sometimes saves the crop, or at least a part of it. Those who experience a difficulty with canker in Melons should cultivate the plants in large pots, for Melons fruit well in 12-inch or 14-inch pots, and canker seldom attacks plants grown in pots. The latter should be plunged in gentle bottom heat and the roots fed somewhat liberally with liquid stimulants *F.*

VEGETABLE GARDEN.

VEGETABLE TRIALS AT WISLEY.

THE vegetable trials undertaken at Wisley during the past few years have added much to our knowledge of varieties and their behaviour in the garden, and it is a pity that the majority of gardeners have no opportunity of inspecting them, for they would profit by the mass of information the trials afford.

Nearly one hundred different stocks of Cabbage Lettuces were sown last September, and the plants did exceedingly well. The variety Reliance lasted to the end, but was not ready so soon as many of the other sorts.

Cos varieties that are usually grown for early spring use were not ready until several weeks later, with the exception of Goldring's Bath Cos, which is the earliest of this class; it is said to be an old variety, but has hitherto escaped notice.

The trial of Carrots for frame culture has also brought into evidence the value of Amsterdam Forcing. Other trials are in progress and the staff is to be congratulated on the excellent culture and great care exercised in conducting all the trials, and on the great improvements at Wisley since the war ceased. *W. H. Divers, V.M.H.*

NURSERY NOTES.

HARDY FLOWERS AT ENFIELD.

Having visited Mr. Amos Perry's nursery at Enfield last season, and observed several very fine seedling Irises which he had raised, we took the opportunity afforded us of seeing them again this summer to note their behaviour, and also to inspect the extensive collection of rare and choice hardy plants which this suburban nursery contains.

The majority of the Irises are collected together in a large area of ground (see Fig. 10), but several choice and outstanding sorts are planted by themselves, including crosses of the smaller-flowering species, such as I. chrysographes, which Mr. Perry has crossed with several Chinese and Californian Irises. A hybrid of I. chrysographes, crossed with I. Hartwegii, is quite distinct from either parent, being a tall-growing plant, bearing purplish flowers of the Hartwegii character, and with the characteristic markings of chrysographes. This plant has falls growing at almost right angles, and the prostrate foliage of Hartwegii. The original clump has developed twenty flower spikes. Another interesting hybrid is I. chrysographes crossed I. Bulleyana, named Chrysogana. This flower has beautiful falls like the chrysographes parent, broad, and of a rich old china-blue colour, heavily mottled with white. The flower spikes attain to a height of over 2 feet. Another hybrid, I. chrysographes crossed with I. Forestii, named Chrysofor, has yellow standards and blue falls; seedlings of the second generation from this cross have produced flowers of almost all colours, including yellow, rich purple, sky blue, and white and blue.

Of the taller Bearded Irises, Mr. Perry's seedling named Lady Sackville attracted our notice, with its soft, silvery blue standards, rich purple falls, and a conspicuous yellow crest. Near by were growing such fine Irises as Lord Lambourne, Geo. Yeld, a very free blooming variety, Duke of York, Ambassadeur, with thirteen or fifteen flowers on a plant, a very dark-coloured Iris, with maroon falls overlaid with black; and I. Flammenschwert, one of the best of the German-raised Irises, with rich golden standards and madder crimson-coloured falls.

The newer varieties raised by Mr. Perry are remarkable for their tall stature, many of them growing 4 feet high, with stout, erect flower scapes, and having a conspicuous branching habit. Perhaps the pick of the collection were the following:—Mrs. C. Pearson, a large flower with prettily incurved standards that are delicately tinted with a very pale mauve and with falls of the same colour; Mrs. H. F. Bowles, a very tall variety and remarkable colour combination, the standards being of a soft brown overlaid with old gold, whilst the falls are of a brilliant brick-red, with a distinct glistening sheen and a white-lined base; Lady Charles Allom, which reaches a height of 3½ feet, the stout stems bearing handsome, sweetly-scented flowers of a rich lavender-blue, with falls a little darker; Geo. Yeld, one of the most remarkable of Mr. Perry's seedlings, named in honour of the President of the English Iris Society, having bright apricot-coloured standards tinted with salmon-rose and falls of a brilliantly rosy-crimson, which are edged with buff; this also is a variety of tall stature, reaching 3½ feet high; Ducalion has apricot-coloured standards suffused with rose and falls of a pretty crimson-purple irregularly edged with grey; the height is 4 feet; Marjorie Tinley, which was illustrated in *Gard. Chron.* of June 30; Eden Phillpotts, a variety to be recommended on account of its freedom of flowering, and its tall, stout branching flower stems, which bear dark lavender-blue blossoms set off by a prominent white and yellow crest; Feronia, a strong-growing variety producing a well-formed flower, with standards of an uncommon shade of soft rosy-bronze, and falls of old rose colour heavily lined with madder crimson; Belladonna, one of the most strikingly effective of the self-blue Irises in the whole of Mr. Perry's collection. The plant flowers with great freedom, for which purpose it is valuable for cut blooms, whilst the stems are 3½ feet tall. Cassandra is a seedling Iris of large size, and the flowers are of good shape; the large, broad standards are incurved and coloured rosy-violet, whilst the falls are crimson overlaid with black, and have a bronze-coloured base reticulated with white; Dejah is a tall, early-flowering pallida Iris, with silvery-blue standards and bright mauve-coloured falls; Kulan Tith has the same characteristic stature as the others, and the tall stems bear flowers with lavender-blue standards and deep lavender falls overlaid with rose.

FIG. 10.—SEEDLING IRISES AT MR. AMOS PERRY'S NURSERY.

Whilst passing to the Irises we were compelled to stop frequently to inspect some of the more notable of the numerous fine hardy plants. Of these Hieraceum villosum, a plant that is downy all over, was a sheet of rich golden yellow, which showed to advantage against the pretty, greyish, villose foliage. This is a splendid plant for a dry bank, and continues in flower from early June to September. It grows about 15 inches high. Several fine Geums deserve special mention, including the variety Lady Hillingdon, the flowers of which suggested a St. John Wort; this variety blooms all through the summer, and grows about 9 inches tall; Lady Stratheden is a large, double, orange-yellow flower, a fine companion to the scarlet Mrs. Bradshaw. Amongst several Violas raised by Mr. Perry, one named Princess Mary is of outstanding merit. It is a form of V. gracilis, with rich violet-blue flowers as big as those of a tufted Pansy, and it will continue in bloom until its flowers are spoiled by frost. A trio of good hardy flowers was seen in Erigeron Elsie, Aster peregrinus, and Erigeron Edina. The first is a very beautiful flower, and from the profusion in which the blossoms are produced it should prove valuable for market purposes. The colour is a pleasing delicate pink, and the central disc is like a piece of velvet dotted all over with gold. Aster peregrinus is one of the best of the dwarf flowering alpine Asters, whilst Erigeron Edina has fine white flowers. Two new plants of merit seen were Geranium sanguineum roseum, a delightful shade of soft rose colour, and the rare Silene californica, a brilliant scarlet colour, to which we recently referred.

These nurseries are famous for hardy Ferns, and Mr. Perry's stock numbers some 100,000 plants, the majority of which are grown in beds protected with a lattice-work house, the purpose of which is to give shade rather than shelter, for it is found that shade causes more development in the fronds and accentuates their distinctive characters. The chief genera cultivated are Scolopendriums and Polystichums. Of the Scolopendriums or Hart's Tongue Ferns there are three hundred distinct varieties, in all manner of forms. Some have divided and ramose fronds, others stag-horn fronds and stag-horn crested fronds, but nothing amongst the Scolopendriums is more beautiful than forms of the crispum type, with beautiful goffered edges. The diversity in this single species of Fern is remarkable; some of the leaves are not more than a quarter of an inch wide, whilst others are even narrower and grow length-wise rather than broad, attaining to a height of 3 feet. The marginal differences are very remarkable; some are goffered, others scalloped, and still others have toothed margins, like saw teeth.

Polystichums are almost as varied as Scolopendriums, and Mr. Perry's collection includes some two hundred distinct sorts. In this family the more handsome are the plumose and divisilobed forms. Some have fronds like a bank of moss, others are erect-growing and spreading and Todea-like in habit. Among the best of the angulare type are lineare, Moly, and angulare capitatum, Moly. Other important genera of Ferns cultivated are Athyrium, the Lady Fern, and Lastrea, the Male Fern.

The soil in which the Ferns are grown is liberally mixed with peat and leaf-mould; no manurial stimulant is afforded. The chief pests are slugs and woodlice, and these may be kept at bay by placing lime around the base of the plants. Those who plant these hardy Ferns should take care not to expose them in cold, draughty places, otherwise they are able to withstand all kinds of weather. Athyrium and Scolopendriums revel in a shady position, but nearly all the Polystichums may be grown in full sunshine, and many of the varieties in the driest positions. Early planting is essential, for preference autumn in the case of loose or sandy soil, but where the texture is heavy spring planting is best. Mr. Perry's specimen plants are accommodated in a cool house, and a selection of these, see Fig. 11, was exhibited by him at the recent Chelsea show.

HOME CORRESPONDENCE.

St. Cuthbert's Cole.—Mr. Britten will find this name in the list of old plant names at the end of Gerard's *Herbal*, as also Seadock, which in *Sinonomia Bartolomei* (*Anecdota Oxoniensis*) is called Seahock. The names of Sedum album will be found in *Alphita*, in the same series as the last named. There is an almost uncanny similarity between the quotation on the Hollyhock, given by Mr. Britten, from Archdeacon Lindsay's book, and remarks published in *Chambers's Journal*, October, 1921, in an unsigned article by me. I wrote: "It may have acquired 'holy' from its association with Lindisfarne—the Holy Island—or from the saint of that name (St. Cuthbert), after whom it was called St. Cuthbert's Kale." It is very many years since I came to the conclusion that the present-day Hollyhock derived its name from the Marsh Mallow by substitution. *R. P. Brotherston.*

Double Buttercups.—It was interesting to read on page 10, in your issue of July 7, about the Double Buttercups—*e.g.*, Ranunculus bulbosus fl. pl. At The Drum, Midlothian, I observed early in May of this year, and growing in the woodland not far from the garden, a small colony of Ranunculus Ficaria with double yellow flowers; perhaps this species is better known by its common names of Pilewort and Lesser Celandine. I once found a double white or yellowish-white flowered plant of this species, and I have read of a double-flowered form of Ranunculus acris. *David Armstrong.*

INDIAN CORRESPONDENCE.

CLIMBING PLANTS.

I was very interested in J. S. D.'s article on Solanum Wendlandii on page 272, of your issue of May 19 last, more especially as this plant is one of the few lovely, blue-flowered climbers, and, as yet, little known. The only successfully grown plants which I saw in Europe were in the greenhouse at Kew some years ago, attached to the rafters and some 15 inches or more from the roof glass. An even more beautiful greenhouse climber is Petraea volubilis, a scandent or twining plant, native of South America; it bears bright, pure azure blue, large, star-like flowers, in large, elegant, wreath-like clusters; seen in full bloom in India in March it is one of the loveliest objects the eye could rest upon. But, alas, the sun's rays soon destroy the richness of its colour. In an English greenhouse it would grow admirably, especially if given a good sandy compost and an abundance of water when growing, reducing the amount of water to a minimum during the short days of winter. By way of propagation my nurseryman prefers to get young plants from layers. Of course, here, in India, we grow the Petraea on arches in the open.

Another climbing shrub, little known in England, but very beautiful and equally suitable for greenhouse cultivation, is Poivrea coccinea, or Combretum coccineum. With us, it is a large, climbing plant with slender stems, and almost constantly in blossom with a profusion of small, bright crimson flowers, borne in large, compact, brush-like bunches, beautifully displayed against the bright, cheerful, glossy green of the foliage. It is one of the handsomest and most prized ornaments of Indian gardens.

Probably no plant in the world presents a more truly gorgeous appearance when in flower than Bignonia venusta. This, too, I feel sure, would grow successfully in a warm English greenhouse, attached to wires. From the axil of each leaf is borne a crowded, drooping corymb of tubular, orange-vermilion-coloured flowers, two inches long. We use this plant extensively at Patiala for covering arches and bare, unsightly walls, where it requires very little attention beyond a good soaking of water at the roots and overhead occasionally. *George Burrows, Superintendent of State Gardens, Patiala, India.*

SOCIETIES.

ROYAL AGRICULTURAL.

The 82nd annual show of the Royal Agricultural Society was opened at Newcastle-on-Tyne on July 3. The weather was fine, and there was a large attendance on the opening day. In addition to the record entry of stock and machinery, it is gratifying to record that the horticultural section has never previously provided a display to compare with the one made on this occasion. Not only were the competitive classes, with the exception of Orchids, keenly contested, the non-competitive displays were more numerous than usual.

In adjoining tents the forestry and the educational sections, under the charge of the Royal Arboricultural Society, and the Armstrong College made most interesting displays.

GROUPS

In the classes for a group of miscellaneous plants Messrs. J. CYPHER AND SONS won first prize with a beautifully-arranged group. The foliage plants comprised Codiaeums in variety; finely coloured Dracaenas, Aralias, Asparagus and Ferns, while prominent among the flowering plants were good specimens of Cattleya Warscewiczii, Laelio-Cattleya Canhamiana, Masdevallia Harryana, Cypripediums in variety and good plants of Clerodendron Balfouri and C. fallax. Mr. W. A. HOLMES, Chesterfield, 2nd, with a finely arranged collection of Codiaeums, Dracaenas, and Liliums. In the class for a collection of Orchids, Messrs. STUART LOW AND CO. were the only exhibitors; they staged a small group of Cattleyas, Odontoglossums and Odontiodas. For collection of Sweet Peas, Messrs. ROBERT BOLTON AND SONS won first place with baskets of Picture, Hawlmark Salmon, Daffodil, R. F. Fulton, Wizard, Sunset and Fire Queen; 2nd, Messrs. E. W. KING AND CO.; 3rd, Mr. J. STEVENSON.

In the class for a collection of hardy perennial plants and cut blooms, 40 feet by 10 feet, the object was to afford a representation of a hardy flower border. In this class the exhibitors seemed to ignore the wording of the schedule, as regards overcrowding, for with the exception of Mr. T. A. LAWRENSON, Gosforth, who won first prize, none followed the instructions. Mr. LAWRENSON'S group was a fine arrangement of plants, all of which were grown in pots, and thus offered better facilities for producing the natural border effect, which evidently appealed to the judges; 2nd, Messrs. HARKNESS AND SONS, with a glorious display of bunches of flowers in massed formation; Messrs. GIBSONS AND SONS were placed 3rd; and Messrs. W. ARTINDALE AND SONS, Sheffield, 4th. For a collection of Roses Mr. E. J. HICKS led with a beautifully arranged stand, in which the colours were beautifully blended, and the flowers effectively arranged, Lady Hillingdon in the centre, Ophelia and Mrs. Herbert Stevens at the ends, being most attractive. Messrs. A. J. ALLEN, Norwich, 2nd, with fine, fresh flowers of Mrs. Henry Morse, Hoosier Beauty, Christine, and Mrs. Herbert Stevens.

For a collection of cut Carnations, Mr. C. ENGELMANN led with a grand display of choice blooms of White Wonder, Peerless, Enchantress Supreme, Tarzan, Saffron, Delice, Cupid, Topsy, Laddie, and other fine varieties; 2nd, Messrs. STUART LOW AND CO. In the class for a collection of border Carnations, Mr. H. LAKEMAN was the winner, with a grand collection, the most prominent varieties being Lieut. Shackleton, Orange Pink, Border Yellow, Grenadier, Elaine, Purple Clove, and Bookham Rose.

FIG. 11.—HARDY FERNS EXHIBITED BY MR. AMOS PERRY AT THE CHELSEA SHOW. (SEE P. 26.)

Messrs. BLACKMORE AND LANGDON were the only exhibitors of a collection of Begonias, and showed one of the finest groups they have ever set up. The same firm also won first prize in the class for Delphiniums.

NON-COMPETITIVE.

Messrs. ALLWOOD BROS. had a magnificent group of splendid Carnations and Pinks, set up in their usual artistic style (Large Gold Medal). Messrs. SUTTON AND SONS made a fine display of Clerodendron fallax, with bunches of Sweet Peas, Delphiniums and Lilium speciosum, They also had Melons and early vegetables (Large Gold Medal). Messrs. ALEXANDER DICKSON AND SONS had a very fine display of Sweet Peas, and among their attractive novelties were Purple Perfection, Lucifer, Celeste, and Prince of Orange (Large Gold Medal).

Messrs. B. CANT AND SONS exhibited a comprehensive collection of cut Roses, which included the new Lady Roundway, which received a Gold Medal at Regent's Park, and Lady Dixon Hartland (Silver Medal). Mrs. S. S. THOMPSON showed a very fine collection of Cacti

Digitized by Google

and allied plants (Silver Medal). Messrs. LANG AND MATHER exhibited a very fine collection of hardy annuals and other border plants (Silver Medal). Messrs. H. ELLISON AND SONS exhibited Ferns extensively (Silver Medal). Messrs. JOHN FORBES, LTD., showed a remarkable collection of Pentstemons, Phloxes, Pyrethrums and Violas (Gold Medal). Messrs. R. H. BATH, LTD., Wisbech, displayed a fine collection of Delphiniums, Paeonies, Antirrhinums, Liliums, and other border plants (Silver-gilt Medal). Messrs. W. J. GODFREY AND SON showed a very fine collection of Campanulas, Paeonies, Scabious Pride of Exmouth, a good selection of Lupins, etc. (Silver Medal).

Messrs. BAKERS showed an extensive group of hardy perennial and bulbous plants tastefully arranged, and they also included a model garden (Large Gold Medal). Miss WORTH, Holbeach, sent an extensive exhibit of succulent plants. Messrs. ORD BROS. had a group of Ferns and Palms (Silver Medal).

Messrs. ROBERT BOLTON AND SON showed a very good collection of Sweet Peas, the fine colours of Sunset, Bonfire, Picture, Daffodil, Wizard and Comrade being most attractive (Large Gold Medal). Messrs. DOBBIE AND CO., LTD., Edinburgh, had a grand display of Sweet Peas, the varieties Royal Sovereign and Mary Rose being finely shown. The brilliant Field Marshal and a fine vase of a white seedling were also prominent (Large Gold Medal). Messrs. E. WEBB AND SONS showed Sweet Peas in variety and a small collection of Gloxinias (Gold Medal).

Mr. T. A. LAWRENSON showed clipped trees and shrubs, and alpine plants in variety (Large Gold Medal). Messrs. KENT AND BRYDON, Darlington, had a tastefully arranged rock and Italian garden. In the sunk garden they had a fine display of Irises, Primulas and dwarf shrubs. They also exhibited garden designs, bouquets and wreaths (Large Gold Medal).

Messrs. BROADHEAD AND SONS, LTD., exhibited an extensive rock and water garden, finely arranged with a background of Conifers (Large Gold Medal). Mr. R. V. ROGER had an interesting miniature rock garden, also a large collection of clipped shrubs in the open (Gold Medal). Messrs. MAXWELL AND BEAL, Broadstone, Dorset, showed a miniature rock and water garden, in which were included a number of the smaller Campanulas.

Outside the tent Messrs. MACK AND MILN had a fine arrangement of various Roses, border flowers, and ornamental trees and shrubs. Messrs. DICKSON AND ROBINSON showed Carnations, Dwarf Roses, Spiraeas, border flowers, and annuals in variety. Messrs. W. FELL AND CO. had a fine display of greenhouse and hardy plants and flowers; Messrs. LITTLE and BALLANTYNE showed Hydrangeas and trees and shrubs; Messrs. DICKSON, BROWN and TATE showed Carnations in variety, with Astilbes and Delphiniums; Messrs. SUTTON AND SONS had a varied collection of early vegetables and roots; Messrs. J. CARTER AND CO. exhibited early vegetables, bulbous plants and annuals; Messrs. WEBB AND SONS showed Sweet Peas and Begonias; Messrs. DICKSONS, Chester, showed Astilbes in variety, Paeonies and hardy flowers; Messrs. CLIBRANS showed annuals, Roses and hardy flowers in variety; Messrs. FINNEY exhibited Sweet Peas in variety and Liliums, and an exclusive collection of early vegetables and Melons. THE FOUR OAKS COMPANY had an extensive collection of syringes and spraying apparatus; and Messrs. KENT AND BRYDON arranged a sunken garden, with a border of herbaceous plants and a centre bed of Hydrangeas.

SCOTTISH ARBORICULTURAL.

THE members of the Aberdeen and Northern branches of the Royal Scottish Arboricultural Society recently visited the Cawdor and Kilravock estates in Nairnshire. Nairnshire is the finest wooded county in Scotland, thirteen per cent. of its area being afforested. The company included the Earl of Leven and Melville, Colonel Hugh Rose, C.M.G., of Kilravock, Colonel Sutherland, of the Forestry Commission, Major Scott, Captain Newton, Sir John R. Gladstone, Mr. Sydney J. Gammell, Major Law, Mr. John Michie, M.V.O. (late factor to the King at Balmoral Castle), Mr. Donald Munro, Mr. Peter Leslie, Forestry Department of Aberdeen University, and many head foresters from the large estates in the northern half of Scotland. There were also present a number of Forestry Commission officers.

The beautiful town of Nairn was the venue chosen for the meeting place, and from thence the company proceeded to inspect the historic woods of Cawdor. This is one of the most beautiful estates in the British Isles, and provided an enormous quantity of timber during the war. Guided by Mr. Charles Clark, head forester, the party had a two hours' walk through the policies leading to Cawdor Castle. Fine specimens of trees abounded on all sides, many of them reckoned to be 100 to 130 years old, and containing on an average from 50 to 60 feet cube each, while some of the giants were estimated to contain something like 200 feet cube. Scots Pine, Larch and Spruce were seen growing profusely, and of magnificent dimensions. The historic castle was also visited, and here Mr. George Bain, a Nairn antiquarian, gave the party an entrancing story of the establishment of the castle in 1454, of its owners in olden days, and of subsequent events. The exquisite panellings of some of the rooms, Oak and Fir, made from wood grown on the estate, were greatly admired.

Kilravock estate, with its ancient castle, the property of Colonel Rose, was next visited. Interesting demonstrations were given here of blasting a hard "pan" of earth to facilitate the preparation of the ground for tree planting. Numbers of holes were drilled to depths varying from three to four feet, charges of gelignite were laid and fused, and the party saw miniature craters bursting, loosening and shaking the earth for a considerable distance around each charge-hole. Colonel Rose explained that each charge cost about a shilling, which, he thought, would prove far too expensive to be applied practically. He suggested the Government might step in in such a matter, and agree to let landowners have a part of the surplus explosives at a cheap rate. If a system of blasting on an extensive scale were adopted, it might give employment to many ex-Service men.

The fine woods of Kilravock contain trees of great age and dimensions. Oaks there were which seemed to have passed their zenith of strength and glory, and were evidently breaking down from sheer old age. Unfortunately there have been no records kept of these trees, hence their age could only be surmised. Here also was seen what the experts declared is one of the finest Sitka Spruces in this country. It measures 18 feet in girth and 120 feet in height.

During the proceedings, a halt was made to hear an address from Col. Sutherland, of the Forestry Commission. Col. Rose presided and introduced Col. Sutherland, who said he was glad of the opportunity to explain before so distinguished a gathering of experts the nature of the operations and aspirations of the Forestry Commission in Scotland. Since the end of 1919 the Commission, he said, had bought four estates, and had fenced twenty-three areas, large and small. Altogether, the Commission now held for the State about 90,000 acres. They found it comparatively easy to purchase land, but rather difficult to feu it. He appealed for help in acquiring more land by feu. They wanted blocks of 500 acres or more, and could now take 25,000 acres of afforestable land. He predicted that if encouragement were given the Commission in their search for feuing land, those who helped would not regret it. High prices need not be expected for feuing areas. Dealing with the work of the Commission in the two divisions—north and north-east—in which those present were chiefly interested, Colonel Sutherland said they had Mr. Scott in the Northern Division with eight operations in being and two or three in prospect. Those schemes were scattered over six counties. Up to the end of last season Mr. Scott had planted 4,150 acres, and produced in ten nurseries 6,500,000 transplants and seedlings. Mr. Annand in the Aberdeen Division, had seven operations, and more in prospect. He had planted 2,650 acres, and the large nurseries at Aberdeen, developed under his care, had now a stock of 12,500,000 transplants and seedlings. Col. Sutherland then dwelt on the many duties devolving upon divisional officers, including unemployment schemes. These latter schemes had been successful throughout Scotland where private enterprise had, as usual, responded. In the Northern Division 70 schemes had been accepted in two years, and in the North-Eastern (Aberdeen) Division 105 schemes. Through both nearly 7,000 acres had been planted, and 8,000 acres prepared for planting. He trusted this was a side of the work that would continue, and that grants or subsidies should be given to everyone—corporations or private owners—who set to work to put more trees into the ground. He stated that the Commission was gradually finishing the census of British woodlands—a valuable work if maintained up to date systematically in the future. It would bring out the quantity of timber marked for present use and likely to be marked for the next twenty years or more.

Colonel Sutherland referred to the establishment of the new Chair of Forestry in Aberdeen University, and paid warm tributes to Mr. Peter Leslie, the lecturer in forestry at Aberdeen, and the Principal of the University (Sir George Adam Smith) for the deep interest they had taken in forestry.

In answer to a question by Mr. John Michie, Colonel Sutherland said the Government, for an expenditure of £30,000, had made the country richer by 15,000 acres of plantations. Mr. Peter Leslie urged the provision of scholarships for forestry trainees—such as farm servants and others unable to attend classes in the agricultural colleges. Col. Sutherland, replying, said he felt sure Lord Lovat would favourably receive the suggestion. He knew the difficulties many students experienced in gaining their degrees, and how these difficulties greatly restricted the supply of students. Unfortunately, the Commission had not the money to give the help required.

At this stage of the proceedings a very happy ceremony was enacted when Mr. Charles S. France, Aberdeen, who on Tuesday, June 12 celebrated his 80th birthday, and was present at the meeting, was presented with a beautifully inscribed snuff mull and a wallet of Treasury notes. Mr. Gammel, of Countesswells, spoke in terms of warm appreciation of the fine work Mr. France had done for forestry during his long life, and Mr. John Michie, who made the presentation, declared Mr. France had been the life of the Aberdeen Branch of the Society, and he had sent out many young men who had done as good work for forestry as any in the country. Mr. France made a long and reminiscent reply, and expressed confidence that forestry in Scotland would go on and prosper.

Kilravock Castle was then visited, and the members were hospitably entertained by the genial proprietor—Col. Rose. Tea was served in a room of the castle, which still preserves the chief features of its construction in 1416.

Sir John R. Gladstone paid a warm tribute to all who had assisted in making the excursion a success, and his comment that "this has been a day you will remember for many a year" was warmly endorsed by the company, who concluded the outing by a stroll through the quaint old-world gardens at Kilravock.

ROYAL CALEDONIAN HORTICULTURAL

THE ordinary monthly meeting of this society was held at 5, St. Andrew Square, Edinburgh, recently, Mr. W. G. Pirie, senior vice-president, in the chair.

A lecture was delivered by Professor J. A. S. Watson, B.Sc., F.R.S.E., professor of Agriculture in the University of Edinburgh, on "Modern Research in Plant Breeding."

The exhibits were—Tulips, from Messrs. Dobbie and Co. (awarded a silver medal); East Lothian Stocks, from Mr. W. Lamont, Edinburgh (awarded a Cultural Certificate); and Primula pulverulenta, from Mr. J. Coventry Colinton.

Digitized by Google

MANCHESTER AND NORTH OF ENGLAND ORCHID.

THURSDAY, JUNE 21.—*Committee present:* A. Hanmer, Esq. (in the chair), Messrs. R. Ashworth, B. J. Beckton, J. Birchenall, A. Burns, D. A. Cowan, A. Coningsby, A. T. Cussons, A. G. Ellwood, W. Giles, Dr. Hartley, J. Howes, J. Jackson, A. Keeling, J. Lupton, D. McLeod, F. K. Sander, E. W. Thompson, J. Whitham, and H. Arthur (Secretary).

FIRST-CLASS CERTIFICATES.

Odontoglossum Doreen var. Dreadnought (*Empress of India* × *eximium*), a large variety of good shape and heavily blotched; *Odontioda Vesurius* (*Odta. Cooksoniae* × *Odm. L'Aiglon*), a variety with very brilliantly coloured flowers. From S. GRATRIX, Esq.

Cattleya Juno var. The King (*Hardyana* × *Warneri*), a large and richly coloured flower with a very dark lip. From A. HANMER, Esq.

Odontioda Flamingo var. ignea. A brilliant scarlet coloured variety; *Odontoglossum eximium xanthotes var. Thelma*, one of the finest forms, with large, deep yellow blotches on the segments. From Messrs. J. AND A. MCBEAN.

AWARDS OF MERIT.

Odontioda Windsor (*Odta. Sanderae* × *Odm. illustrissimum*); *Odta. Coronation var. Rainbow and Odontoglossum Helvetia.* From Mrs. GRATRIX.

Cattleya Isabel Sander var. brugense; *Laelio-Cattleya Papyrus* (*Dominiana* × *Lustre.* From S. GRATRIX, Esq.

Odontoglossum Eros maculatum (*Othello* × *President Poincaré*) and *Odm. crispum Nora.* From A. HANMER, Esq.

Oncidium Gardneri, Hartley's var. From Dr. R. N. HARTLEY.

Odontoglossum Meguelito Invincible (*Dora* × *Doris*) and *Dendrobium melanodicus var. Kathleen* (*Ainsworthii* × *Findleyanum*). From Messrs. J. AND A. MCBEAN.

GROUPS.

Messrs. J. AND A. MCBEAN, Cooksbridge, Sussex, staged one of the finest groups in the annals of the Society, a Gold Medal and special Cultural Commendation being awarded.

S. GRATRIX, Esq., Manchester (gr. Mr. J. Howes), was awarded a large Silver Medal for a group in variety.

A large Silver Medal was awarded to Capt. W. HORRIDGE, Bury (gr. Mr. A. Coningsby), for a group of Miltonias in great variety, including Hyeana, which was awarded a Silver Medal, the plant having previously received a First-Class Certificate.

ANNUAL MEETING.

The annual general meeting of the Society was held at 2.30 p.m., A. Hanmer, Esq., presiding over a fairly good attendance. The minutes of the previous annual general meeting were read and adopted. The report and balance sheet were submitted and approved. A. Hanmer, Esq., was re-elected President, and Dr. Craven Moore, the Rev. J. Crombleholme, Dr. R. N. Hartley, Mr. B. J. Beckton, and Mr. A. Cussons appointed members of the Committee. Mr. H. Arthur was re-elected Secretary. Prizes were presented to the successful competitors as follow: Mr. J. J. BOLTON'S prizes for Cypripediums; Gold Medal to S. GRATRIX, Esq. (prize to gardener, Mr. J. Howes); Silver-Gilt Medal to A. HANMER, Esq. (prize to gardener, Mr. W. Giles); Botanic Society of Manchester's Silver-Gilt Medal to Mrs. BRUCE and Miss WRIGLEY: Silver Medal to S. GRATRIX, Esq. The prize-winners of Dr. R. N. Hartley's competition for culture in conjunction with the above medals were:—1st, Mr. A. BURNS; 2nd, Mr. J. HOWES, and 3rd, Mr. W. A. STEWART.

Messrs. Charlesworth's Objet d'Art for new awards was awarded to S. GRATRIX, Esq. (gardeners' prize, Mr. J. Howes); Mr. GRATRIX was also awarded Messrs. J. Cypher and Co.'s prize for arrangement of groups; Messrs. Evans' Silver Trophy for Odontoglossums, to A. HANMER, Esq., Silver Trophy for the most points, and Messrs. Hassall and Co.'s prize for Cattleyas and hybrids; Mr. Gratrix's Silver Cup for Odontiodas was awarded to A. HANMER, Esq. (gardener's prize, Mr. G. Giles); Messrs. Keeling's Gold Medal for botanical species to B. J. BECKTON, Esq. (gr. prize, Mr. W. A. Stewart); Messrs. Stuart Low's Trophy for small amateurs to J. WHITHAM, Esq. (gr. prize, Mr. E. Grears); Messrs. J. and A. McBean's Trophy for Cymbidiums to the Rev. J. CROMBLEHOLME (gr. prize, Mr. E. Marshall), and Messrs. Sander's Gold Medal for cut Orchid flowers to Capt. W. HORRIDGE (gr. prize, Mr. A. Coningsby). Mr. P. Smith's prizes for groups were awarded to Mr. J. HOWES, 1st; Mr. W. GILES, 2nd; and Mr. A. BURNS, 3rd.

OXFORD COMMEMORATION SHOW.

THE Royal Oxfordshire Horticultural Society held its Commemoration Show in the Wadham College gardens. In the centre of one large tent was a most beautiful group of plants (not for competition) sent by the President, Mrs. G. H. MORRELL (gr. Mr. A. Gibson), arranged with much skill. The chief subjects used were Malmaison Carnations, Clarkias, Gloxinias, Streptocarpus, Miltonias, Thunias, Lilium Harrissii, and Odontoglossums.

In the competitive class for a group of plants, Messrs. J. CYPHER AND SONS, Cheltenham, won first prize with an exceedingly choice selection of plants. Mr. C. ENGELMANN'S first prize exhibit of Carnations contained grand flowers of Benora, Laddie, White Wonder, Peerless, Tarzan, and Topsy. For a group of greenhouse plants Mrs. LESSING secured first honours with a bold and imposing arrangement of Palms, Crotons, and seedling Hippeastrums. Mr. F. C. LEVETT'S trade display was deservedly awarded the silver challenge cup presented by Councillor L. H. Alden. An aeroplane worked in flowers and suspended from the top of the tent over his exhibit was a great attraction.

Messrs. WEST AND SONS had on view a very interesting collection of Japanese trees, and Messrs. TUCKER AND SONS' stand came in for a good deal of attention. The collections of Roses from Mr. G. PRINCE and Mr. J. MATTOCK were excellent.

For 24 cut Roses Mr. G. PRINCE won first prize and Mr. H. DREW second. In the class for 18 Roses Mr. G. PRINCE beat Mr. H. DREW, but for Tea Roses the positions were reversed. The Sweet Peas shown by Mrs. LESSING were of a high standard of excellence. The first prize for an arrangement of hardy perennials was won by Mr. JOHN JOHNSON; it contained a number of good things, and was a great feature to the show.

The table decorations were very good and the competition keen. Messrs. WEST AND SONS had a choice arrangement of Carnations, for which they gained the first prize; Mr. HENRY DREW was second. Some excellent fruit was staged; Mrs. LESSING'S first prize Peaches were very good; she was also first for Melons. Mr A. E. BRADSHAW had the best collection of vegetables.

KENT COUNTY SHOW.

JUNE 19, 20, 21.—The Horticultural Committee is to be congratulated on the success of the first exhibition held in conjunction with the show of the Kent County Agricultural Society on these dates. Competition was keen in the sections for herbaceous flowers, Sweet Peas, and Carnations. The trade was well represented, the traders' exhibits occupying two large tents, and, despite one of the most unfavourable seasons on record, many excellent groups were staged. Only one exhibit was forthcoming in the class for a group of miscellaneous plants in and out of bloom, for which a first prize of £45 was offered. It was shown by Messrs. J. CYPHER AND SONS, Cheltenham, and was worthily awarded the first prize.

The class for a collection of hardy perennial plants and cut blooms, arranged on a space 30 feet by 10 feet, was intended to be a representation of a hardy perennial border. Three excellent exhibits were staged. Messrs. GEO. BUNYARD AND CO., Maidstone, won the first prize of £25 with an exhibit of outstanding merit. Messrs. HARKNESS AND SONS, Bedale, were placed second with flowers of wonderful quality, but the group was much too crowded to represent a natural hardy flower border; third, Messrs. GEO. CLARK AND CO., Dover, also with a good exhibit.

The PRESTON HALL COMPANY, Aylesford, was placed first for a collection of cut tree Carnations arranged on a space of 15 feet by 5 feet, and they were also placed first for a collection of Sweet Peas, occupying 20 feet by 5 feet.

The sum of £12 was offered as a first prize in a class for a collection of Roses. Mr. C. ENGELMANN, Saffron Walden, was awarded a special prize for a fine exhibit of Carnations.

The following were the principal medal awards:—*Large Gold Medals* to Messrs. ALI WOOD BROS., Haywards Heath, for Carnations; Messrs. TOOGOOD AND SONS, Southampton, for vegetables and flowers; and Messrs. DICKSONS, Belfast, for Sweet Peas. *Gold Medals* to Messrs. GODFREY AND SONS, Exmouth; Messrs. MARCHAM AND CO.; and Messrs. HARKNESS AND SONS. *Silver Gilt Medals* to Messrs. BASTIN AND SONS; Messrs. MAXWELL AND BEALE; Messrs. G. WHITELEGGE AND CO.; and Messrs. BAKERS, Wolverhampton.

GENERAL BULBGROWERS' OF HAARLEM (HOLLAND).

THE following awards were made to novelties by the various committees of the above society during May, 1923:—

FIRST-CLASS CERTIFICATES.

Tulip Red Monarch (*Breeder*) (*Panorama* × *Feu Ardent*). A deep scarlet variety, with an orange glow and a yellow centre.

Tulip Mongolia (*Cottage*). A dark, creamy-yellow variety.

Dutch Iris ten Cate. A dark yellow, unicoloured variety.

Iris filifolia (*xiphium praecox*) *The First.* A variety with light blue standards, and falls very soft blue. It is very early in flowering.

AWARDS OF MERIT.

Tulip l'Aurore. An early, double-flowered variety, of soft carmine colour.

T. Turner (*Darwin*). A pink variety with a white margin.

T. Jeanne Désor (*Cottage*). A golden-yellow variety, with orange-red stripes.

Aster alpinus Dunkle Schöne. A large-flowered, double, bright violet coloured variety.

Aster sub-coeruleus Venus. A light violet variety, with an orange-coloured centre; the flowers are developed on long stems.

Armeria cephalotes Miss Max. The colour of this Thrift is soft violet-rose.

Iris filifolia (*xiphium praecox*) *D. Haring.* The standards are soft grey-blue, the falls creamy-white, with a yellow blotch.

I. filifolia (*xiphium praecox*) *P. de Moulin.* The standards are dark indigo-blue and very long; the falls blue, with a clear yellow blotch.

I. Hoogstraten. A light blue variety, with a yellow blotch.

I. van Scorel. The standards of this variety are grey-blue; the falls white, with a big yellow blotch.

I. pallida Riese van Connern. A bright sky-blue variety, with big flowers developed on long stems.

I. squalens Ambassadeur The standards are bronze shaded violet; the falls purple-violet.

Ixiolirion Ledebouri. A dark blue, early variety.

Lilium umbellatum splendidum. The colour of this Lily is vermilion and orange.

Paeonia Whitmanniana rosea. A soft pink-coloured variety.

Pyrethrum Eileen May Robinson. A soft pink, large-flowered, single variety.

Digitized by Google

ROYAL HORTICULTURAL.

JULY 10, 11.—The usual fortnightly meeting was held at Vincent Square, Westminster, on these dates. The weather was oppressively hot and the temperature of the hall excessively high; only late in the day was an attempt made to admit air by the large side doors. There seemed to be fewer visitors than usual, for many were probably attending the big show at Wolverhampton, but the hall was well filled with exhibits, although many of the flowers showed the influence of the tropical weather. The principal subjects exhibited were Delphiniums, Carnations, Roses, Orchids, Streptocarpuses, Canterbury Bells and hardy herbaceous flowers and alpines. The Bunyard medals competition for Cherries was responsible for two fine exhibits of these fruits from trade growers in the Sittingbourne district. The competition itself was restricted to a single entry. At the next meeting there will be a competitions for Gooseberries, Peaches and Nectarines, and it is to be hoped that many amateur growers will compete for the beautiful medals offered by Messrs. Bunyard and Co., who are to be congratulated in their endeavour to stimulate interest in fruit exhibits at these meetings.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), the Hon. H. D. McLaren, Messrs. James O'Brien (Hon. Secretary), Gurney Wilson (Assistant Secretary), Frederick J. Hanbury, Arthur Dye, Fred. K. Sander, H. T. Pitt, S. W. Flory, Pantia Ralli and H. G. Alexander.

AWARD OF MERIT.

Vuylstekeara insignis picta (*Miltonia Bleuana* × *Odontioda Charlesworthii*), from Messrs. CHARLESWORTH AND Co. A charming hybrid with showy coloured flowers, very different from those of the pale original cross which gained a similar award on June 30, 1914. The plant now shown had a fine spike of six large flowers in which the Miltonia parent predominated. The petals and upper sepals are claret-purple with broad, white margins and tips; the lateral sepals are lighter in tint, and the broadly ovate lip is white with a rose-purple base and yellow crest.

OTHER EXHIBITS.

Messrs. STUART LOW AND Co., Jarvisbrook, were awarded a Silver Banksian Medal for an effective group, Cattleya Warscewiczii varieties being arranged at the back with showy hybrid Cattleyas, and Laelio-Cattleyas with Odontoglossums and Odontiodas. Interesting and rare species in the group were the rare Epidendrum Brasavolae, with fine spikes of rose-tipped flowers; the very rare Odm. hastilabium; and species of Bulbophyllum and Dendrobium. The group was skilfully arranged, the graceful Brassia verrucosa and other slender species in the centre being well displayed.

Messrs. CHARLESWORTH AND Co. showed a selection of rare hybrids, including a fine form of their large and showy Laelio-Cattleya Momus; Odontonia Thais (M. Bleuana × Odm. Aglaon), a large and richly coloured hybrid; Laelio-Cattleya Appam, a rich yellow flower with a maroon lip; Odontioda Gwendolen, like a finely coloured Odontoglossum, but with Odontioda features; and Vuylstekeara Edna (Miltonioda Harwoodii × Oda. Charlesworthii), a good carmine-red flower.

Messrs. SANDERS, St. Albans, staged a good selection, in the centre of which was a fine plant of Stanhopea tigrina of the original type with a pendulous raceme of large, fleshy, purple-blotched flowers. The group contained a large yellow form of Odontoglossum Schlieperianum; the superb white Miltonia Lambeauiana; forms of Cattleya Thurgoodiana and probably the handsomest form of Cypripedium Godefroyae (var. splendidissimum) yet shown, the large flower being richly lined and veined with maroon purple.

Messrs. COWAN AND Co., Southgate, showed the new and handsome Laelio-Cattleya Murillo (L.-C. rubens × C. Empress Frederick), a finely formed flower with rosy-mauve sepals and petals with white midribs at the base; and broad crimson-purple lip with gold lines from the base.

Floral Committee.

Present: Messrs. H. B. May (in the chair), C. Williams, D. B. Crane, H. V. Warrender, G. Reuthe, J. Heal, W. B. Gingell, Wm. Howe, J. B. Riding, W. P. Thomson, C. E. Pearson, S. Morris, R. C. Notcutt, A. Turner, W. G. Baker, E. A. Bowles and G. Loder.

AWARDS OF MERIT.

Delphinium Sylph.—A good white variety, certainly the best of the whites. The flowers are double and well arranged on the stems. Shown by Mr. F. GIFFARD, Hornchurch.

Delphinium My Lady.—A pale lavender-mauve coloured variety with a white centre. The spikes are about eighteen inches long and well proportioned; it is one of the best novelties in these flowers seen during recent times. Shown by Mr. F. GIFFARD, Hornchurch.

Carnation Mrs. Groom.—A border variety of salmon-rose colour, with smooth petals. The stem is long and stout, and the calyx is non-splitting. The flower has a pleasing perfume. From Messrs. J. B. GROOM AND SON, Gosport.

Campanula persicifolia Ryburgh Bells.—A very fine variety of the Telham Beauty type, pale blue in colour, the flowers large and well disposed on the stems. From Messrs. G. STARK AND SON, Ryburgh, Norfolk.

GROUPS.

Carnations were, as usual, a prominent feature, and appeared to withstand the heat well. Messrs. ALLWOOD BROS., Haywards Heath, contributed a large display in vases and pyramids, in which were noted excellent examples of Lieut. Shackleton, Forester, Grenadier, Effie Dean and Centurian; these all are of the border section, while in the perpetual-flowering class the most prominent sorts were Mary Allwood, Benora, Edward Allwood, Claret and Topsie.

The same exhibitors also showed fine vases of their perpetual-flowering Malmaisons and Dianthus Allwoodii in variety.

Messrs. STUART LOW AND Co., Bush Hill Park, also contributed Carnations, arranged in bowls, vases and other receptacles. The varieties Eileen Low, Mrs. Hamilton Fellowes, Sir Mackay Edgar, Red Ensign, White Pearl, and Mrs. T. Ives, were especially good and tastefully arranged with Asparagus and their own foliage (Silver Flora Medal). Mr. C. ENGELMANN, Saffron Walden, was represented by a table of blooms arranged on a groundwork of Asparagus Sprengeri. The flowers all exhibited the highest cultivation, the best being Tarzan, Cupid, Laddie, extra fine, Topsy and Jessie Allwood (Silver Banksian Medal).

Messrs. J. B. GROOM AND SON., Gosport, arranged a table of their new border Carnation Mrs. Groom, which received an Award of Merit.

Four vases of perpetual-flowering Carnations were shown by Mrs. E. P. F. SUTTON, Sydmouth Grange, Reading. The varieties were the Baroness de Brienen, in good form, Mary Allwood, equally well grown, while the other vases were filled with various sorts (Bronze Flora Medal).

Delphiniums are generally a strong feature at this season, and on this occasion they were well up to the average for July, and, indeed, superior than could be expected, for the weather has been too dry for these stately flowers Mr. H. J. JONES, Lewisham, added again to his long list of successes with a magnificent display of these flowers. The background of the group was occupied with tall pyramids of spikes, while the ground was covered with two distinct rows of baskets. The flowers were beautifully clean and fresh. A few of the outstanding sorts were F. W. Smith, Andrew Carnegie, Marvel, Roselaire, The Alake, Mrs. Day, Thos. Stevenson and R. C. Pulling. The front was formed with dwarf Campanulas edged with Adiantums (Gold Medal).

Messrs. BLACKMORE AND LANGDON, Bath, also staged an extensive collection of Delphiniums, arranged on the floor of the hall. The combination of colours was most pleasing, the leading varieties were Blue Queen, Mrs. Townley Parker, Blue Boy, very fine, Millicent Blackmore, Sir Douglas Haig, very fine, Lord Derby and Prince Henry (Silver-Gilt Banksian Medal).

Hardy flowers from Messrs. BARR AND SONS, King Street, Covent Garden, were most interesting and seasonable, inasmuch as they included well-grown spikes of Lilium candidum, Irises, in variety, Campanula Telham Beauty, Gaillardia Mrs. Bateman Brown, and Centaurea macrocephala (Silver Banksian Medal).

Messrs. JAS. CARTER AND Co., Raynes Park, presented a charming exhibit of their new strain of Iceland Poppies, Crepe de Chine. The strain is undoubtedly an advance in the development of P. nudicaule. The pale salmon and lemon shades were especially fine, whilst the orange shades are much deeper than in the type (Silver Banksian Medal).

Messrs. BUNYARD AND Co., Maidstone, displayed hardy flowers, such as Delphiniums, nicely arranged as to colour, some very fine Scabiosa caucasica, in varying shades of colour, which makes one wonder if named varieties of this plant are required. Other features were Pinks, early-flowering Gladioli, the pretty little Campanulas C. pulsilla, and C. p. tyrolensis, with its deeper-coloured flowers.

Messrs. SUTTON AND SONS, Reading, occupied the centre of the hall with a circular group of Canterbury Bells, which were, owing to the tropical weather, getting somewhat over. The calycanthema forms were particularly good, and all the plants were well developed (Silver Banksian Medal).

Hardy flowers were well displayed by Messrs. RICH AND Co., Bath, whose chief exhibits were varieties of Chrysanthemum maximum, the variety Rentpayer being especially useful at this season, while Beauty of Bath is broader in the petal and a little later. A new strain of Sweet Williams was also prominent, and, as the plants have a dwarf habit, they will be useful in a variety of situations in the garden.

Messrs. R. TUCKER AND SONS, Oxford, displayed a small, but interesting group of herbaceous and alpine plants. The Delphiniums were in good condition especially Blue Bird and The Alake, while Campanulas noted were C. G. F. Wilson, Miss Willmott, kewensis, C. Bellardi Miranda, and C. pulloides, with various pots of Thymus staged in variety (Silver Banksian Medal).

Mr. THOS. CARLILE, Loddon Nurseries, Twyford, occupied a corner of the hall with an exhibit of well-developed Delphinium spikes arranged in vases. The colours were well blended, and the groups pleasingly arranged. Some of the best varieties were Nora Fergusson, Robert Cox, F. W. Smith, Fernand Foreaus, and Lavanda.

Messrs. B. LADHAMS, LTD., Shirley Nurseries, Southampton, contributed a bright table of hardy flowers. Pinks were a feature, especially the varieties Coronation, Elsie, Salmon Rose, Mary and Inchmery; they also showed Lavatera Olbia rosea, Campanula Hostii major, C. rhomboidalis and C. rotundiflora, Jenkin's variety. A very charming collection and well arranged (Silver Flora Medal).

Messrs. LOWE AND GIBSON, Crawley Down, staged a small collection of Gladioli seedlings, those of the primulinus section exhibiting a wide range of colours, while the varieties displayed were noteworthy for the fact that the seed was sown in 1922 (Silver Banksian Medal). Mr. E. SCAPLEHORN, Beckenham, Kent, contributed a collection of hardy flowers which occupied both sides of a table. We noticed Gladiolus Halley, some good English Irises, Delphiniums, Scabiosa caucasica, in extra good form, Delphiniums, Irises, Gaillardias and a collection of Ixias with their quaint colours.

A fine basket of Delphiniums from Messrs. R. H. BATH, Wisbech, was a distinctive feature. The spikes were large and boldly arranged,

Digitized by Google

without overcrowding. The Alake, René Gilbert, Pannonia, Lavanda, Ivy Jean, and Rev. E. Lascelles were most prominent. Other subjects included Gladioli Halley and Prince of Wales, and vases of Centaurea macrocephala which were much admired by visitors (Silver Flora Medal).

A stately exhibit came from Messrs. J. KELWAY AND SONS, Langport, Long rows of Delphiniums were brightly displayed, without crowding, which certainly added to their beauty, while in the foreground were vases of Gaillardias, such as Austen Chamberlain, King George, Goddess and Lord Birkenhead; conspicuous Delphiniums were Canopus, Jas. W. Kelway, Childhood, Lieut. Sowry, D.S.O., and Smoke of War (Silver Floral Medal).

Hardy flowers were also exhibited by Messrs. SKELTON AND KIRBY, Pirbright, Surrey, in which they featured Dianthus Pirbright Glory, a single pink form, Delphiniums in variety, Salvia virgata nemorosa in fine form, with Heucheras in variety (Silver Banksian Medal).

Mr. ERNEST DIXON, Putney, arranged a small rock garden, on which the chief features were Campanula Spetchley, a pretty small white variety raised by the late Mrs. Berkeley, which appeared to be ideal for such positions. Associated with it was the beautiful Campanula Miss Willmott.

A very fine table of hardy flowers was displayed by Mr. G REUTHE, Fox Hill Nurserv, Keston, who had some fine crosses between Onena foliosa and O. latifolia, of various shades of colour. Lilium Grayi and L. Parryi are two interesting Californian species (Silver Floral Medal).

Messrs. DOWNER, Drayton Manor Nurserv, Chichester, again presented his new Lupines, which included some good seedlings in white, red and pink shades. Scabiosa caucasica seedlings were also worthy of note; they represented a fine strain, embracing most of the colours recently seen in named varieties (Silver Banksian Medal).

Messrs. CARTER PAGE AND Co., London Wall, E.C.2, occupied a large table with a display of well-grown hardy flowers, which presented a fresh, bright appearance A few of the chief features were Aster mesa grande, Campanulas in variety, Heleniums, Centaureas and Delphiniums; also a tastefully arranged little rock garden on which were to be seen a variety of dwarf Campanulas, Thymus, Sedums and Sempervivums (Silver Banksian Medal).

Hardy flowers were extensively exhibited by Messrs. J. CHEAL AND SONS, Crawley, who had also some boxes of alpines, together with a nice exhibit of Star and Mignon Dahlias. The Star Dahlias are very bright and admirably adapted for use as cut blooms (Silver Banksian Medal)

Hardy flowers were also well displayed by Messrs. M. PRICHARD AND SONS, Christchurch, who specialised in Astilbes, Phloxes, Veronicas and their well-known Prichardi Pinks (Silver Floral Medal).

THE CENTRAL GARDEN SUPPLIES, Kenton, Harrow, were represented by a display of dwarf shrubs and alpine plants arranged with stone and other material.

Messrs. WATERER, SONS AND CRISP, LTD., Twyford, had a good display of hardy flowers, which withstood the heat well and looked as fresh at the end of the day as they did in the morning. Gaillardias and Delphiniums were the chief features.

Mr. G. W. MILLER, Clarkson Nurseries, Wisbech, also contributed to the wealth of hardy border flowers, having some well-grown vases of Campanula Dainty, Gaillardias, Paeony Marie Lemoine and Sidlacea Rosy Gem amongst a large variety of other subjects (Silver Banksian Medal).

A fine collection of stove and greenhouse plants was displayed by Messrs. L. R. RUSSELL, LTD., Richmond. The plants were remarkably well grown, and as specimens were superb. The foliage plants included some good examples of Crotons, Dracaenas, Anthuriums and Caladiums. The last included the varieties Pintado, candidum, and La Perle du Brésil, while the flowering plants embraced Gloriosa Plantii, Medinilla magnifica, Anthuriums, and Acalypha Sanderiana (Silver Floral Medal).

Messrs. HOPWOOD AND SON, Cheltenham Spa, presented single Petunias in beds of moss. The strain is undoubtedly a good one, as was demonstrated by a few plants in pots, which were carrying blooms of extra large size.

Roses gave no evidence of having been out in the previous night's storm, for they were fresh and bright, even if lacking in substance, and they made a striking display. Messrs. G. BUNYARD AND Co., Maidstone, had an exhibit of Roses in vases, arranged on a dull, putty-coloured matting, which detracted from the effect. The most prominent varieties were Los Angeles, Willowmore, Golden Emblem, The Queen Alexandra and K. of K. (Silver Floral Medal).

Messrs. F. CANT AND Co., Colchester, had a small exhibit of Roses at the end of the hall, arranged in pyramids and fan-shaped vases. The flowers were wonderfully fresh and bright, and withstood the heat well. The best varieties were Mme. Edouard Herriot, a glorious colour, General McArthur, Golden Emblem, Mrs. George Norwood and Madame Ravary.

Messrs. R. and G. CUTHBERT, Southgate, staged a table of Streptocarpus in a fine variety of colours. The flowers were staged in bowls embedded in Fern and Asparagus, giving the impression they were growing in pots: it is certainly a very fine strain of this useful greenhouse plant.

A group of well-grown Caladiums was shown by Mr. R. ARNOLD, Torch House, Streatham (gr. Mr. T. Tomlinson), the plants being good examples of cultural skill, and nicely arranged with small Cocos Palms, Pteris Ferns and the small Caladium argyrites. A few of the best Caladiums were Thos. Tomlinson, Siegfried, Stromboli, Leopold and Lord Reading (Silver Floral Medal).

Fruit and Vegetable Committee.

Present: Messrs. P. C. M. Veitch (in the chair), Geo. F. Tinley, S. B. Dicks, W. F. Giles, H. Prince, A. W. Metcalfe, T. Pateman, J. Harrison, E. A. Bunyard and A. N. Rawes.

Some exceptionally fine Peaches of Hale's Early variety were shown by Sir C. NALL-CAIN, Brocket Hall, near Hatfield (gr. Mr. T. Pateman). Mr. Pateman was awarded a Cultural Commendation.

A Bronze Knightian Medal was awarded to the GUILD OF BLIND GARDENERS for a small collection of vegetables, which included very good Lettuces, Peas, Potatos, excellent Turnips and Radishes.

Messrs. R. GILL AND SON, Falmouth, showed a seedling Strawberry, named Gill's A1, raised from Royal Sovereign × Mme. Kooi, a large, round berry most nearly resembling the last parent in appearance, and said to be of much better flavour.

COMPETITION FOR CHERRIES.—Only one exhibit was forthcoming for Messrs. Bunyard and Co.'s medals offered for exhibits of Cherries. The exhibitor was Sir C. NALL-CAIN (gr. Mr. T. Pateman), who showed six dishes, including the varieties May Duke, Kentish Bigarreau and Duchesse de Palluau.

This competiton resulted in two exceptionally fine exhibits of Cherries staged by trade growers in the Sittingbourne district. The one included twenty-four and the other twenty-seven varieties. The smaller collection, shown by Messrs. DEANE AND Co., LTD., Sittingbourne, was awarded a Silver-Gilt Hogg Medal. The more striking varieties were Napoleon, Early Rivers, Governor Wood, Kentish Bigarreau, Black Eagle, Circassian, Elton Bigarreau, Frogmore Bigarreau, Nutberry Blacks, Waterloo, Knight's Early Black, and Arundel (syn. Roundells). The other collection, shown by Messrs. G. WEBB AND SON, Sittingbourne, included such sorts as Early Clusters, Black Heart, Napoleon Bigarreau, Early Lyon, Governor Wood, Cockle Heart, Early Amber, English Red, Elton Heart, Amber and Knight's Black, and was awarded a Silver Hogg Medal.

TRADE NOTE.

A MEETING of the Technical Committee of the Chamber of Horticulture was held on June 27, Mr. F. C. Mosley (Reading University) presiding. Others present included:—Professor H. Maxwell Lefroy (Imperial College of Science), Mr. A. S. Galt (Leeds University), Mr. T. Parker (Messrs. Murphy and Son), Mr. C. H. Curtis (*Gardeners' Chronicle*), Mr. C. Engelmann, Dr. R. Seymour Cobley, and Mr. C. H. Matthews.

A great volume of correspondence from honorary correspondents, together with specimens of diseased plants, also pests, were examined by the committee. Replies have been sent to all concerned, and include the undermentioned points of general interest:—

Grease Bands.—Bands as narrow as 1½ inch are useless; to be of value they should be much wider. A minimum width of six inches is advised, with particular care taken to see that the bands are on early in October and kept sticky until the following April. Silver Leaf.—This would appear to be on the increase in most districts. It is of vital importance that the necessity for cutting and burning dead wood should be impressed on everybody concerned. Celery Rust.—The instance given of the large number of affected Celery seedlings is exactly what might have been expected. The fungus, Septoria petroselini, is for the most part transmitted by seed, and no Celery seed ought ever to be sown without sterilisation. This should be done by immersing the seed for three hours in a solution of one part of commercial 40 per cent. formaldehyde in 500 parts of water. Spread out to dry, and sow the seed as soon as possible, as the germination may be to some extent affected if left for any length of time. If an attack on growing plants, 4—4—50 Bordeaux mixture should be used. Where a serious attack has occurred, change the ground on which the Celery is grown. Red Spider on Cucumbers.—A trial is recommended of a spray of ½ oz. nicotine 95 per cent., 1½ oz. liver of sulphur (fresh), three gallons of water. Carbolineum.—The facts concerning the killing power of carbolineum on insect eggs are noted from various sources. Strawberry Tortrix.—The Committee were asked as to the efficiency in the field of the method of destroying pupae by mowing and burning the foliage, but were unable to give any successful experiences in this respect. They point out the very great value of constantly stirring the soil between the rows, so that birds may gain access. If many larvae are present after the first fruit is picked, a spray of lead arsenate, 4 lb. per 100 gallons, with 2 per cent. calcium cassinate, could be used with advantage. Apple Mildew.—The trial of the following sprays is suggested. Affected tips should be removed, but the trial of sprays of lime sulphur, ammonium copper carbonate, and ammonium polysulphide is suggested. The last should be used only on a small scale until the effect of its use is seen. A casein spreader might be used with the lime sulphur. Aphides.—Nicotine and soap sprays are most effective, care being taken to have a sufficiency of soap according to the hardness of water available. Early spraying is essential, especially in the case of leaf-curling aphides. A late spray—in October—is useful, using either nicotine and soap or paraffin emulsion. This to kill the egg-laying generation. For both aphides and Apple suckers the great value of late limewashing is pointed out. Freshly slaked lime in water, used as thick as the nozzles will spray, and applied late, just as the buds are opening. One and a half to two pounds of lime per gallon of water is the usual quantity. The spraying of all affected trees is essential, otherwise the old ones serve as breeding grounds.

Eelworm.—There is no known soil insecticide efficient against eelworm; .03 per cent. Cresol emulsified might be tried experimentally. Starvation treatment would probably be found as effective as anything that can be done, keeping all eelworm host plants off the intested land for a minimum of three years. For Heterodera under glass very heavy dressings of lime have been found particularly effective in keeping down the pest. Up to 45 tons per acre have been used.

THE WEATHER.

WEATHER IN JUNE.

JUNE was a month of unprecedentedly strong and persistent north-westerly and westerly winds, and low daytime temperatures. It was also one of the driest Junes on record, and yet one of the most sunless. Owing to the absence of the easterly winds at night, usually frequent in the month, the minimum temperatures were not specifically low, and the chilly, stormy, dull days therefore produced a mean daily range of temperature (or difference between day and night) which was by far the smallest June value in the fifty-two years' history of the Observatory. The mean temperature was 53.7°, or 2.9° below the average. Only 157 hours of sunshine were recorded, or 54 fewer than the normal number. Rain fell on 10 days, or 3 fewer than usual, and the total quantity was so little as 0.58 inch, or 1.70 inch less than the average. Much of the rain took the form of drizzle, and the sea winds rendered the mean humidity of the air higher than usual. The lack of sunshine and the factors just mentioned reduced the amount of evaporation considerably, notwithstanding the effect of the strong winds. Ozone was exceptionally abundant, and visibility very good. The wind attained gale-force on the 11th and 13th. No ground-frost occurred. Thunder, hail and fog also were absent. *Joseph Baxendell, Borough Meteorologist, The Fernley Observatory, Southport.*

THE WEATHER IN SCOTLAND.

JUNE was remarkably cold and dry, with a mean temperature almost 4° below the normal, and a deficit from the normal rainfall of 2 inches. Sunshine also was below the average, the aggregate number of hours being 145.9; this gives a mean of 4.86 hours per day and a percentage of 29, against a normal percentage of 32. While rain fell on 11 days, there was no day of continuous rain, and only on 7 days did the amount reach or exceed 0.04 inch. In all 0.74 inch was collected, of which 0.17 inch fell on the 9th—the wettest day. The barometer, with a mean of 30.05 inches, varied from a highest of 30.37 inches on the 2nd to a lowest of 29.55 inches on the 9th. The mean temperature was 54.5°, with a mean maximum of 63° and a mean minimum of 46°. The highest maximum of 76° was recorded for the 18th, and the lowest minimum of 37° for the 15th. On the grass, with a mean of 42°, the minimum temperature fell to its lowest of 33° on the night 15th-16th; then there was no ground frost. At 1 ft. deep the soil temperature rose almost steadily from 49° to 57°. The wind, which was frequently strong, came chiefly from the west and south; there were gales on the 8th and 10th. *John Davidson, Director of Studies, Meteorological Station, St. Andrew's Provincial Committee Training College Gardens, Mayfield, Dundee.*

NEW HORTICULTURAL INVENTIONS.

This list is specially compiled for *The Gardeners' Chronicle* by Messrs. Rayner and Co., Regd. Patent Agents, of 5, Chancery Lane, London, from whom all information relating to Patents, Trade Marks and Designs can be obtained gratuitously.

LATEST PATENT APPLICATIONS.

15200.—Tuxford, G. L.—Garden hoes. June 11.
14717.—Cranswick, C. T.—Devices for scaring birds, etc. June 5.
14596.—Morrison, J. A. S.—Fertilisers. June 4.
14350.—McGee, F. D.—Combination grass shears and hedge trimmer. May 31.
14389.—Perkins, F. A.—Heat-treatment of plants. May 31st.
13877.—Booton, H.—Implement for planting bulbs, etc. May 25.
13811.—Hands, A. V.—Garden shears. May 25.
13493.—Pate, T. M.—Implements for planting cabbages, etc. May 22.

SPECIFICATIONS PUBLISHED THIS MONTH.

197,989.—Howard, A. C.—Rotary hoe cultivator.
198,081.—West, C. E.—Plant labels and the like.
198,111.—Stirling, E. M.—Motor-driven lawn mowers.
198,241.—Sarel, W. G. M.—Appliance for producing artificial ventilation of the turf and soil for golf and other greens and lawns.
198,242.—Brewer, G. W. S.—Fertilisers and processes for the production thereof.

ABSTRACT PUBLISHED THIS MONTH.

Lawn Mowers. Patent No. 196768.—The latest design of lawn mower is made with reciprocating knives like a reaping machine, the adoption of which gives, according to the inventor, Mr. P. A. Campbell, 789, Granville Street, Vancouver, several advantages over rotary knives for grass cutting. The laterally reciprocating knife-bars are operated by crank-pins engaging the sides of vertical slots in brackets secured to the knife-bars, the crank-pins being mounted on pinions driven from the main carrying wheels of the machine. The carrying wheels are provided with internal teeth which mesh with pinions on a transverse shaft driving a longitudinal shaft through bevel-gear. The longitudinal shaft carries a pinion engaging gears carrying the crank-pins. Covering plates are provided to protect the gearing. The height of cut is adjusted by varying the vertical position of two side rollers, carried on a frame, which is pivoted on the main axle of the machine.

Messsrs. Rayner and Co. will obtain printed copies of the published specifications and abstract only, and forward on post free for the price of 1s. 6d. each.

ANSWERS TO CORRESPONDENTS.

APHIS ON ROSES: *A. B.* Your Roses are very badly infested with the common Rose aphis, Siphonophora rosae. Attacks are invariably more insistent in dry weather than during a wet period. There are various proprietary insecticides on the market for use against attacks of this aphis, but if you wish for a home made insecticide, boil ten ounces of quassia chips in a gallon of water for several hours, allow the mixture to stand all night, strain off, boil again, and while very hot, stir in one ounce of soft soap. When cool dilute the solution with nine gallons of water.

FUNGUS ON AN AZALEA: *J. D.* The foliage you sent is affected with the fungus Exobasidium rhododendri. Gather and burn all foliage showing the gall-like growths. It has been found that if the galls are removed and burnt before they have developed any colour, the plants are free from attack in the following year.

GRUBS ATTACKING YOUNG CAULIFLOWER PLANTS: *E. N.* When Cauliflower plants are being transplanted it is a good plan to dip the roots in a thin mortar-like mixture of clay, soot and flowers of sulphur. A good handful of flowers of sulphur and an equal quantity of soot should be mixed with a small bucketful of the clay and water. If the roots are dipped in this before they are planted, it will tend to prevent the attacks of maggots, fungous and insect pests.

PEACHES DEFICIENT IN FLAVOUR: *W. R. B.* The lack of flavour in your Duke of York and Hale's Early Peaches is due more or less to the absence of sun, but both these varieties are grown more for their earliness than their high quality. The leaves of the former are clean, but thin in texture, and you would do well to feed the trees liberally and syringe them now that the fruits have been gathered; use a little more potash when the fruits are swelling and ripening next season. The leaves of Hale's Early are suffering from an attack of red spider. This should be removed and the tree fed as advised above. It may be that the thin texture and light colour of these leaves are due to malnutrition, but a sharp look-out should be kept on this tree for silver leaf, and any affected shoots removed and burnt before the leaves not allowed to suffer from want of water fall. The border is rather shallow, but if and carefully fed the trees should not suffer from this cause.

PLUMS DISEASED: *C. W. L.* The Plums are covered by the "brown rot" fungus (Monilia cinerea). The original deformation of the fruits was presumably caused by the Plum pocket fungus, Exoascus pruni.

REMARKS.—There has been a considerable volume of business during the past week, the fine weather favouring the consumption of fruits and Tomatos. So far the labour trouble at the docks has had no appreciable effect on Covent Garden Market trade, but should it continue the values of home-grown fruit should improve. Strawberries have been in good demand, and all consignments have sold well. Choice fruits, such as Grapes, Peaches, Nectarines, Figs and Melons, continue in demand, in spite of competition with Strawberries. Cherries have been in firm request, all varieties having sold freely, as have those from France and Holland, when in good condition. Black Currants from the Continent have arrived out of condition, which has benefited home growers, and Black Currants have sold particularly well. Red Currants have also met a ready market. Dessert Gooseberries are realising good prices, and green berries have also shared in the general improvement of trade. Raspberries generally are small, but good samples are making satisfactory prices. Tomatos are in heavy supply, but prices keep firm and steady. Cucumbers are a good trade, as are all other salads. Mushrooms are showing the effects of the heat, but their prices are fairly good and show little fluctuation. Cauliflowers are easier in price. The new Potato trade has been a little variable in view of the uncertainty of arrival from St. Malo and the Channel Islands.

CUT FLOWERS.

REMARKS.—The summer weather has resulted in large supplies of cut blooms being marketed, and many consignments have been difficult to clear at the lowest prices; so far the consignments are the heaviest this season. The quantities of Roses and Carnations have greatly exceeded the demand. Roses continue to be of moderate quality and the blooms greatly affected by the hot weather. Carnations also have suffered injury through the excessive warmth, and only those grown and packed under the best conditions will stand for any considerable time. Many of these blooms were disposed of to street vendors at almost give-away prices at the close of the market. Lilium longiflorum shows a tendency to harden in value owing to short supply; L. lancifolium rubrum is increasing in quantity, and is being marketed in good condition. Alstromerias, Coreopsis, Cornflowers, Gaillardias, white Pinks, Sweet Peas, Gypsophila, Sweet Sultans and Godetia are in abundant supply. The country trade has been reduced, and the general conditions in this department are not very encouraging for growers—a not unusual circumstance in July.

GARDENING APPOINTMENT.

Mr. J. Monzer, for the past one year and ten months Gardener and Bailiff to C. S. CLARKE, Esq., Tracy Park, Wick, nr. Bristol, and previously with Sir CHARLES FITZWILLIAM, Oakham, as Gardener to Lt.-Col. W. E. Moss, Hilfield Park, Aldenham, Watford, Hertfordshire.

CATALOGUE RECEIVED.

Dr. Hall: Collector of Japanese Plants.

The fifties of the nineteenth century mark an epoch in horticulture. It was then that Japan began to yield to other lands the treasures of her countryside and gardens. So early as 1856 the firm of Siebold and Co., of Leyden, published a sale catalogue of newly-introduced Japanese plants. Following closely on the Russian hybridist Maximowicz, who travelled in Japan from 1859-64, were John Gould Veitch, who visited that country in 1860, and Robert Fortune, who made two visits in 1860 and in 1861. Horticultural history knows less, however, of the enterprise and enthusiasm of another amateur of Japanese plants, Dr. George Rogers Hall, who, during many years spent in Japan, sent to America large and varied collections of Japanese trees and shrubs, some of which undoubtedly first reached the United States as a result of his enterprise. Dr. Hall's genuine love of horticulture, his perspicacity of choice of Japanese plants of garden value, and the garden in which he grew many of his introductions, are now described* by his grandson, James M. Howe, Jnr., and add a chapter to the history of horticulture which is full of interest not only for horticulturists of the United States, but also for those of all countries. George Rogers Hall was born in Bristol, Rhode Island, in March, 1820. After a youth spent on his father's farm he qualified as a medical practitioner, and after graduation in 1846 he proceeded to China to practise medicine. After some years, Dr. Hall abandoned his profession and engaged in trade. He was thus led, in 1855, to visit Japan before that country had been formally opened to trade. From that date he began to send home collections of Japanese plants. Some were planted in his garden at Bristol where certain of them still survive. His last visit to Japan was in 1875, three years after he had succeeded his father in the possession of the farm at Bristol. In that garden there still stands the original Japanese Yew, Taxus cuspidata var. nana, which species Hall was the first to introduce into America, twenty-six feet tall, with a spread of one hundred and thirty feet. This Yew, which the Editor of the *Journal of the Arnold Arboretum* characterises as the most valuable plant brought to the United States from Japan, has dark evergreen foliage, a spreading habit, and bears bright red berries in autumn. It has now become—no doubt largely because of its tolerance for shade—a popular plant in American gardens. Other of Dr. Hall's plants which still stand in the garden at Bristol are Abies firma, A. cilicica, A. cephalonica, Picea pungens, P. polita, a large Picea jezoensis, a specimen of the Umbrella Pine, Sciadopitys verticillata, and numerous Retinosporas. Zelkova serrata, the Japanese Elm, thrives still, and forms a magnificent specimen. Its delicate, arching branches, fine smooth bark and strong habit of growth make it in Mr. Howe's opinion suitable for more general planting—as also does its habit of bearing fertile seed. In addition to many other trees and shrubs of interest is a fine specimen of Hall's Magnolia, M. stellata rosea, with pinkish-white, fragrant blooms. This species, and also Magnolia Kobus were almost certainly first introduced into America by Dr. Hall. So also was Hall's flowering Apple, Malus Halliana, and Hall's Honeysuckle, Lonicera japonica var. Halliana—most useful of climbing plants. He introduced also the Amaryllis (Lycoris squamigera), which has naturalised itself in various places, and in his garden still grows the Japanese Walnut, Juglans Sieboldiana, as also does Corylopsis pauciflora. Among the first consignment of Japanese plants sent by Hall to Mr. Parkman was a Lily which was flowered and exhibited by the latter as a "New Lily" before the Massachusetts Horticultural Society in July, 1862, just ten days after Messrs. Veitch had exhibited this Lily, named by Dr. Lindley, the first Editor of *The Gard. Chron*, Lilium auratum. Among other plants prized by gardeners which were introduced by Dr. Hall to the United States were Hydrangea paniculata grandiflora, the beautiful Cornus Kousa, the double-flowered Wistaria floribunda violaceo-plena and Hypericum patulum. Already in 1861 Dr. Hall had sent for the first time to the United States Ginkgo biloba, Thujopsis dolabrata and its variegated variety—he was specially interested in variegation—Sciadopitys verticillata, Cryptomeria japonica, Chamaecyparis pisifera, Juniperus chinensis, Liliums auratum and speciosum, Rhododendron brachycarpum, Hibiscus syriacus as well as others previously mentioned. Acers, A. palmatus in variety, Diervilla japonica, the beautiful Cryptomeria japonica var. elegans, many double-flowered Cherries and Phellodendron Lavallei, still growing in his garden with a trunk three and a half feet in girth; all these and doubtless many more plants were sent to America by this indefatigable and judicious amateur. He sent them and he grew them—a true lover of plants—and all who partake of his nature will rejoice that the filial piety of Mr. Howe should at least have done a measure of justice to the memory of a great pioneer collector. Dr. Hall seemed to care nothing for fame. He dispersed his plants or else grew them for his own enjoyment. Hence, perhaps, it is that when looking at the Crab which he introduced (Malus Halliana) or at the Honeysuckle, Lonicera japonica var. Halliana, few are reminded by the specific names of a man who first collected them and sent them on their successful voyages across the seas to the gardens of two continents.

* "George Rogers Hall, Lover of Plants," *Journal of the Arnold Arboretum*, IV., 1923.

Imperial Fruit Show.—Further particulars of the Imperial Fruit Show, to be held in Manchester, from October 26 to November 3, have reached us, including a plan of the exhibition hall at Belle Vue Gardens, Manchester, the schedules for the commercial and small competitions for fruit growers, and the general exhibition prospectus. We understand that the Guarantee Fund for the show has now reached £4,500, and it is hoped that the £5,000 will be raised during the next week or two. The prizes offered in cash, cups and trophies amount to over £1,500. Applications for space for trade displays have been received from every branch of the fruit trade, consequently there is every prospect of a more thoroughly representative presentation of the fruit-growing industry than at previous exhibitions. Full particulars of the competitions and space available, may be obtained from the Secretary, Mr. J. Tamblyn, 18, Bedford Square, W.C.

Doubling in Primula Bulleyana.—At the recent meeting of the French National Horticultural Society, M.M. Vilmorin-Andrieux and Co., of Paris, brought before the Scientific Committee a double-flowered form of Primula Bulleyana. Such a case, we believe, has never been recorded previously. We understand that this form is really double, having all the parts of the flower petaloid, thus giving the individual blooms a very "full" appearance. It was the long-continued flowering of the plant that attracted attention to it in a batch of seedlings, and owing to the longer life of the double flowers the plant continued in bloom nearly double the usual time, and the plant was very attractive during this period.

"Journal" of the Kew Guild.—Though somewhat late in appearance, the Kew Guild *Journal* for 1923 is none the less welcome, as it is fully as interesting as any of the preceding twenty-nine issues. The frontispiece is a portrait of Mr. E. H. Wilson, M.A., V.M.H., Assistant Director of the Arnold Arboretum, the President of the Guild, and an accompanying appreciation gives an account of Mr. Wilson's horticultural history and brief references to his many plant-collecting journeys on behalf of Messrs. James Veitch and Sons, and, later, on behalf of the Arnold Arboretum. Old Kewites will find particular interest in the report of the deputation of the Kew Guild to the Director on September 8, 1922, when the subject of reorganisation of the system of training student gardeners was brought forward in the hope that well-trained men when leaving Kew would be able to compete on more favourable terms than at present with graduates of universities and horticultural colleges. The deputation consisted of Mr. A. C. Barlett, Major T. F. Chipp, Mr. A. D. Cotton, Mr. J. Coutts, Mr. C. H. Curtis, Mr. W. Dallimore, Mr. W. Hales, and Mr. W. W. Pettigrew. Dr. Hill was entirely sympathetic towards the idea of aiding worthy young men to enable them to pursue their studies in horticulture, botany and mycology, and promised to place the views of the deputation before the Ministry of Agriculture as soon as opportunity occurred. At a

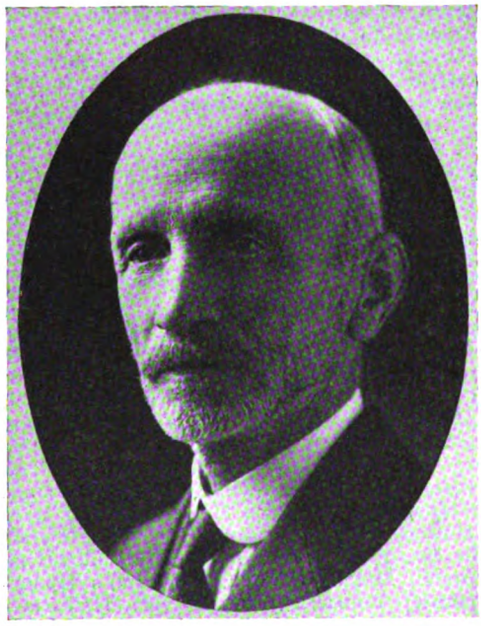
Digitized by Google

later date the Director informed the Guild that in future—(1) a higher standard of education will be demanded of candidates applying for positions as student gardeners; (2) the number of student gardeners will be gradually reduced by seven; (3) the age limits for entrance will be advanced to from 21 to 25; and (4) a form of "leaving certificate" will be drawn up for each student gardener on leaving, on the lines suggested by the deputation. Kindly reference is made in the pages of the *Journal* to the retirement of Mr. W. Watson, who organised the Kew Guild and was its Hon. Secretary and Editor of the *Journal* for a period of about ten years. Notes from Kewites abroad are always of interest, and this year the chief items under this heading are "Notes from Amani Research Institute—Tanganyika Territory"; "Uganda in Retrospect"; "Kewites and Australia"; and "Kew Men in America." References to old Kewites are also made under the heading of "Where They are and What They are Doing," while under "Kew Notes" are numerous items of news concerning the number of visitors at Kew in 1922 (1,143,758); gifts to Kew; meteorological notes; and Kewites whose portraits have appeared in the *Gardeners' Chronicle*. Mr. A. Beer, of the Botanic Gardens, Innsbruck, has contributed an interesting and illustrated article, entitled "A Two-days' Excursion in the Tirol." Various reports are included, notably those of the annual general meeting of the Guild in 1922, the Guild dinner, Mutual Improvement Society, cricket, football and botany clubs, and the lectures, while towards the end of the *Journal*, just before the list of members, there are sympathetic references to Mr. R. L. Castle, Mr. R. A. Dümmer, Mr. W. A. Kennedy, Mr. James MacPherson, and Mr. O. E. Wüg, all old Kewites who have passed away since the previous issue of the *Journal*.

Canadian Florists and Gardeners.—The incorporation of the Canadian Florists' and Gardeners' Association has been effected, and the Charter is to be presented to the President, Mr. C. J. Hay, on the occasion of the banquet, to be held during the convention, which is to take place in the Canadian town of Windsor, on August 7, 8 and 9. At this convention the work of the Canadian Horticultural Council will be reported upon, and discussed, and other subjects to be dealt with are "Carnation Cultivation," "Fertilisers," "Insects Affecting Trees and Shrubs," and "Fuel and Firing." There will be a demonstration of floral art, and discussions on grading, packing, sales, business ethics, co-operation and other matters directly affecting the retail florists' trade. Of especial interest will be the address by Mr. Alex. Simpson, of Toronto University, on "The Relationship of the Garden to the C.F.G.A.," and as the gardeners' sub-section of the Association is of recent formation, this subject cannot fail to rouse great interest. As is usual at such conventions, trips are arranged to surrounding beauty spots, and there are various other social functions.

Seed Potatos.—We have received a further communication from the Ministry of Agriculture pointing out that all growers of Potatos who may desire to sell any of the crop for planting should bear in mind that the Wart Disease of Potatos Order of 1923 requires all Potatos sold for planting to be officially certified. The certificates are of three kinds. (1) That the Potatos have been grown on land believed by the Ministry of Agriculture to be free from Wart Disease. (2) That the crop has been inspected and that on such inspection Wart Disease was not found to exist, or (3) that the Potatos were inspected whilst growing and were found to be of an approved immune variety, true to type and reasonably free from rogues. Certificate (1) can be issued direct from the Ministry in respect of the land in the greater part of England outside the main infected area. In the case of land which is near a known case of Wart Disease, inspection of the crop may be necessary, and certificate (2) will be issued if this inspection is satisfactory. Growers of immune varieties should arrange to have their crops inspected, so that a certificate (3) may be issued. Only Potatos with this latter certificate are allowed to be planted in land infected with Wart Disease, and moreover, it is in the interest of growers generally that the stocks of the immune varieties should be pure and free from rogues. The inspection for purity must be made while the crop is still growing, and applications for inspection should be sent to the Ministry of Agriculture as soon as possible, as after the crop has died down the necessary inspection cannot be made.

Mr. C. R. Fielder.—Small of stature, but large-hearted, gentle and wise, Mr. C. R. Fielder, Inspector of Gardens for the Royal Horticultural Society, is held in high regard by a host of horticulturists. His wide experience, tactfulness, and altogether pleasant manner of dealing with difficult matters, has endeared him to many a gardener who has been placed in an awkward position as a consequence of untoward local circumstances which his employer did not fully appreciate. Mr. Fielder's horticultural career commenced at Hampton Court, and his experience in these famous gardens was followed



MR. C. R. FIELDER, V.M.H.

by a period with Mr. William Bull, Chelsea, then a prominent nurseryman and dealer in new plants. At Chelsea he was employed in the propagating houses, and there gained exceptional knowledge which fitted him for the place of foreman at Londesborough Lodge, Norbiton, where plants were finely and extensively grown. Later, Mr. Fielder became foreman at the Mote Park, Maidstone, and returned there as head gardener to Lady Howard de Walden, after spending some time as gardener to Sir Edward N. N. Newdigate, Arbury Hall, Nuneaton. Two years after returning to Maidstone, Lady Howard de Walden gave up Mote Park, and engaged Mr. Fielder to assist her in developing her garden at St. James, West Malvern. Following the death of Lady Howard de Walden, Mr. Fielder went to North Mymms Park, where he did splendid work in developing the garden in which his employer, Mrs. Burns, took so great an interest. It will be remembered that while at North Mymms Park Mr. Fielder raised a very fine strain of white Hippeastrums, probably the first pure white forms ever seen. Mr. Fielder spent twelve years at North Mymms and then became head gardener to Miss Wilmott, V.M.H. at Warley Place, Great Warley, Essex, a position he held until appointed to his present post with the Royal Horticultural Society. For over a score of years Mr. Fielder has been a member of the R.H.S. Floral Committee, and he has been a member of the Committee of the Gardeners' Royal Benevolent Institution for seventeen years. In 1911, his many services to horticulture were recognised by the well-deserved award of the Victoria Medal of Honour.

Nicotine Powder as a Destroyer of Aphides.—According to experiments conducted by Mr. G. F. MacLeod and Mr. S. W. Harman, of the New York Agricultural Experiment Station, Geneva, the finer grades of tobacco dust containing one per cent. nicotine are highly toxic to the common aphis, and there is little doubt that the material would afford efficient control. The tobacco powder, however, was not so uniformly effective as mixtures containing nicotine sulphate and free nicotine, although the results were good enough for practical purposes. The experiments also proved that tobacco dust could probably be used for the control of other injurious sucking insects. It was found that the insecticidal efficiency of tobacco dust against aphis varied greatly with its physical properties. Dusts of 50-mesh grade or coarser exhibited practically no adhesiveness and possessed little insecticidal value, while the finer grades displayed greater efficiency both as to adhesiveness and killing power.

Empire Cotton and Research.—The Empire Cotton Growing Corporation has recently been considering the necessity for organised research at the Universities and Colleges of Great Britain, and has decided to offer retaining grants to certain Universities where highly specialised research is already going on. The Cotton Corporation has offered to the Imperial College of Science and Technology, South Kensington, the sum of £1,000 a year for a period of five years from October 1, 1923, the money to be devoted to Plant Physiology and Plant Pathology in the Department of Botany. This generous offer has, we understand, been accepted by the governing body, and the research work will be undertaken in the new Botany Building which was recently opened by the Duke of Devonshire, and to which the Rubber Growers' Association of the City of London subscribed approximately £30,000 about two years ago. This donation is tangible evidence of the value which tropical agriculturists attach to the important research work which is being undertaken at the Imperial College, especially in connection with plant physiology and pathology under the direction of Professor J. B. Farmer, F.R.S., and Professor V. H. Blackman, F.R.S. No doubt other groups interested in research work will find it to their interest to support undertakings of this character.

Ormskirk Potato Trials.—The inspection of the growing crops of Potatos planted in the Ormskirk trials to test the immunity of the varieties to Wart Disease will take place at the Potato Testing Station, Lathom, Ormskirk, Lancashire, on **Thursday, August 16.** Attendance on that day is by invitation from the National Institute of Agricultural Botany, but the trial grounds will be open to all interested in Potato growing on the two following days. The Ministry of Agriculture is the responsible authority for the decision and certification as to which varieties are immune to Wart Disease. The Potatos planted in the trials this year include varieties from Australia, from France and other foreign countries, in addition to many seedlings sent in by raisers, growers and from plant-breeding institutions. Other interesting trials of commercial varieties of Potatos are being conducted by the National Institute of Agricultural Botany.

Local Horticultural Societies. — Brighton, Hove, and Sussex Horticultural Society has increased its membership by eighty during the present year, bringing the total membership to some seven hundred. The members had a half-day outing to Cuckfield Park and gardens recently, and over one hundred and fifty were present. The Society has arranged a whole day excursion in the near future to Cowdray Park. Midhurst.—The Challenge Cup presented to the Muswell Hill Horticultural Society by the *Muswell Hill Record*, for the most points obtained at the recent summer show, was won

Digitized by Google

by Mr. S. J. Webber with fifteen points, the runner up being Mr. W. R. Cummins, who obtained twelve points. This is Mr. Webber's second time of winning the cup. Last year he tied with Mr. E. E. Owen.—The members of the Llandudno Allotment Holders' Association paid a visit recently to Penrhyn Castle Gardens, Bangor, where the pleasure grounds and gardens extend to over eleven acres. Mr. Kneller, the gardener, conducted the members through the kitchen, fruit and flower gardens, and before leaving the party visited the Castle to enjoy the beautiful views in the direction of Ogwen, Snowdon, Puffin Island and Llandudno.—Newport (Mon.) and District Gardeners' Society held a flower show in the grounds of Bron-y-gaer, in aid of the local Gwent Hospital on the 28th ult. The event was a great success, for despite the unfavourable season the quality of the flowers was good, and the competition keen. Messrs. W. Treseder, Ltd., added to the attractions of the exhibition by staging floral displays of beautiful exhibits. The chief prize in the show, a gold medal presented by the *South Wales Argus*, was won by Sir Henry Webb, Bt. (gr. Mr. Cole), Castleton, in a class for twelve blooms of Roses distinct.

Appointments for the Ensuing Week.—Tuesday, July 24: Royal Horticultural Society's Committees meet. Wednesday, July 25: Guildford and District Gardeners' Association's show; Mitcham, Tooting, and District Horticultural Society's meeting; Scottish National Sweet Pea, Rose, and Carnation Society's show (two days); Haywards Heath and Mid-Sussex Horticultural Society's show; Tibshelf Floral and Horticultural Society's show. Thursday, July 26: Yorkshire Agricultural Society's show (three days); Rockingham Flower Show; Royal Botanic Society's meeting.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Lady Agnes Byng Geranium.* Of all the summer and autumn beauties that adorn our gardens, perhaps none are more showy and more in favour with the fair sex than the scarlet Geraniums, which, thanks to the gardeners of the present time, are so much improved in form and colour as to supersede the old scarlet altogether. Among the scarlets there is one that may be placed in the first class, if it be not even the best yet produced. It was raised by Mr. Grant, the late gardener at Great Livermere, Suffolk, and named, by request of the late Lady Katharine Jermyn, after Lady Agnes Byng, the then lady of the hall. Anyone who has seen the gorgeous beds that Mr. Grant had on the lawn must have been struck with the number and beauty of its blossoms, the bright green of its foliage, and its symmetrical growth, which at once place it in the van of the scarlets. I have had these facts forcibly recalled to memory, and wish to preserve them, not only from the lamented decease of all the above parties, but also that, as a local plant, a gem which sprang up at our own doors ought, at least in this neighbourhood, to bear its proper name; but I am sorry to say that the liberality of the gardener was abused, and that persons in the trade, to whom he gave cuttings, sent it out under two or three different names, and it is better known around this town as "Frogmore," or "Frogmore Improved," and even the plant that obtained a prize at our show last year was exhibited as "Frogmore," to which it is far superior. Allow me now, sir, to express a hope that, after this, its true history, my brother gardeners in the neighbourhood at least, will discard all other names, and remember our late old friend Mr. Grant, in his pet seedling, the Lady Agnes Byng Geranium. *H. T., Gard. Chron., July* 15, 1848.

Price 12s. 6d. net.—*An Elementary Text-book of Australian Forest Botany.* By C. T. White. Vol. I. Published under the direction of the Forestry Commissioners of New South Wales, 25, O'Connell Street, Sydney.

ORCHID NOTES AND GLEANINGS.

ONCIDIUM MARSHALLIANUM.

AN importation of this fine cool-house Brazilian Oncidium, together with the best form of the scarlet Sophronitis grandiflora and some other showy species, by Messrs. Sanders, St. Albans, gives a pleasing indication that the introduction of Orchid species has been resumed, and that soon we may have again the once familiar auctioneers' catalogues of desirable species which rarely fail to include interesting novelties.

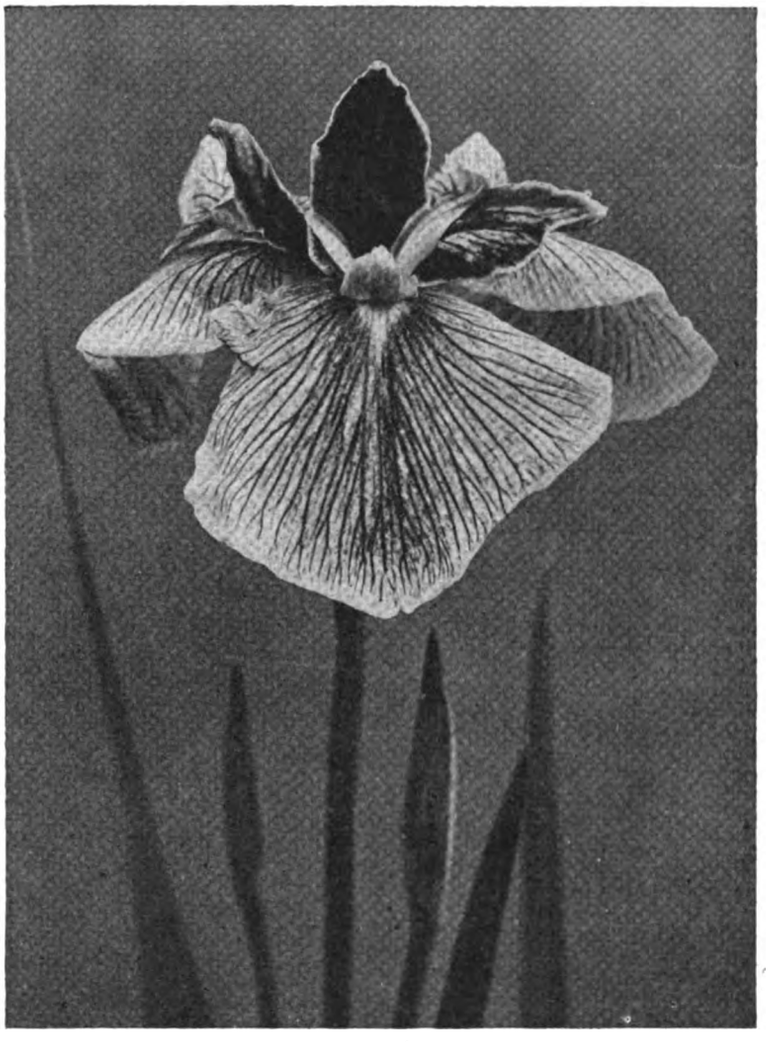


FIG. 12.—IRIS KAEMPFERI PYRFORD GEM; A BEAUTIFUL VARIETY RAISED BY LORD ELVEDON AT PYRFORD COURT, WOKING, AND EXHIBITED BEFORE THE ROYAL HORTICULTURAL SOCIETY ON JULY 10 (SEE P. 38).

Oncidium Marshallianum, with its branched inflorescence of showy flowers with large bright yellow labellum, although known to gardens since 1865, has never been imported in quantity and at present is a rare plant. It is the finest of the section which includes O. crispum, O. praetextum, O. Forbesii and O. Gardneri.

ODONTOGLOSSUM PURPLE GEM.

MESSRS. J. AND A. MCBEAN, Cooksbridge, send a flower of their new Odontoglossum Purple Gem, raised between O. percultum and O. President Poincaré. The flower is of good size and shape, the salient features being the bright violet-purple of the sepals, petals and base of the lip, and the clear white front which make an effective contrast. The sepals have a few pale lilac markings and the tips of both sepals and petals are tinged with lilac. As in most of these purple Odontoglossums, the parentage gives strong O. Pescatorei and O. Harryanum elements in its composition. There is nothing like the clear violet colour of this small section in any of the original species, and it is highly satisfactory that the patient hybridists, by crossing, have been successful in producing such bright tints and at the same time have improved the size and shape of the flowers.

ALBINOS OF MILTONIA VEXILLARIA.

THE fine plant of the beautiful, large-flowered, pure white, Miltonia vexillaria Lambeauiana shown by Messrs. Sanders, St. Albans, at the Royal Horticultural Society on July 10, was one of the best examples of this grand albino vexillaria. It is of the same class as M. v. Queen Alexandra, for which Messrs. Sanders obtained a First-Class Certificate, June 24, 1902, and of which Mr. H. G. Alexander, Orchid grower to Lt.-Col. Sir Geo. L. Holford, obtained a Cultural Commendation for two superb specimens, the one with seven spikes and thirty-six flowers, and the other with six spikes and twenty-nine flowers, the labellums being four inches across. The M. v. Snowflake, for which Sir Geo. Holford obtained a First-Class Certificate in June, 1912, is still one of the finest whites, and M. vexillaria Daisy Haywood is a very fine form.

Albinos of M. vexillaria true have always been rare, and now that recruits to the class by importation are not probable the holders of good forms should raise them true from seed. For M. v. Lambeauiana, M. Firmin Lambeau obtained an Award of Merit when it was first shown in 1907, and Messrs. Sanders a First-Class Certificate in 1910.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

The Cool House.—Should tropical weather continue, everything possible should be done to keep the temperature of this division a few degrees lower than that of the external air. Air should be admitted freely through the bottom ventilators, and the blinds lowered early in the morning before the sun causes the temperature to rise above 60°. Frequently damping the walls, walks, stages, and between the pots, will create a cool and growing atmosphere, in which the inmates of this house revel. During the hottest part of the day the plants should be sprayed lightly overhead several times with clear rain water, which will also be the means of keeping them free from insect pests. Established plants should be allowed to become fairly dry at the roots between each application of water, as no plant can thrive in a compost that is constantly saturated with moisture. When a plant is dry at the roots, it should be soaked thoroughly and then left until it becomes dry again. The great secret in growing plants in pots is knowing when to give and when to withhold water. Newly-potted plants in this department should be watered with great care, and moisture should never be supplied unless the compost is dry. The top ventilators should not be opened too widely, as this would allow internal moisture to escape, and cause a dry atmosphere, which is harmful to Odontoglossums, and the other inmates of this house.

Insect Pests.—In most cases insect attacks are attributable to unhealthy conditions, but generally after spells of hot weather thrips and other pests put in an appearance, and a diligent search should be made for them, and, when detected, the house should be fumigated on two or three nights in succession. Continual sprayings on all favourable occasions will drive out the thrips from the young growths, and if the water is applied to the undersides of the leaves, will prevent attacks of red spider, which delight in hot dry conditions. Should this latter pest appear, a weak solution of some safe liquid insecticide may be used for spraying, until it is eradicated. The old belief that anything other than clean, soft water is harmful for spraying Orchids is erroneous, and if properly applied there is no fear of these plants suffering from the use of insecticides, any more than any other tender plant. In situations that are very dry; and where the structures are lofty and airy, spraying late in the day will be extremely helpful at this season, especially in hot, bright, weather.

HARDY FRUIT GARDEN.

By A. J. HARTLESS, Gardener to Major J. F. HARRISON, King's Walden Bury, Hitchin, Hertfordshire.

Strawberries and Raspberries.—Copious rains have fallen since my last notes were written, and there is hope that fruit dropping through drought may cease. Strawberries and Raspberries will derive great benefit from moisture. Remove all decaying fruit from the Strawberry plants, or they will soon contaminate the sound berries; also cut off runners not required for layering, which should now be attended to. Plants required for forcing should be layered first. Large 60-sized pots will be suitable for layering the bulk of the plants. I have, on a previous occasion, layered Strawberries direct into 32-sized pots, using a good compost and plenty of drainage material. This method proved very useful, and, provided watering is done carefully during the period when roots are forming and protection afforded the plants during heavy rains, it will save time and labour in repotting. A liberal amount of turfy loam should be used, and the compost made firm. If pots are not available, the runners may be kept firmly on the soil by putting stones on them, and very good plants are obtained in this way. The stones should be pressed over the rooting joint. Give every possible assistance to Raspberries, by removing the fruit as it is ready for use. All young canes that are not required should be removed to strengthen those retained for fruiting next year.

Bush Fruits.—Should aphis or mildew be troublesome on bush fruits spraying should be discontinued if the fruits are nearing the stage for picking. Sulphide of potassium or sulphur and paraffin emulsion may be used with safety at any time, but a good washing with the hose-pipe or powerful syringe should be given afterwards.

Blackberries and Loganberries.—American Blackberries are flowering profusely. The shoots of these brambles and Loganberries should be tied up loosely to the trellis or pole, for if allowed to grow at will, they are apt to be trodden underfoot. The weaker shoots should be removed.

Figs.—With warmer days outdoor Figs will need attention in stopping and training the shoots. Make certain that Figs and all wall trees do not suffer from lack of moisture at the roots.

PLANTS UNDER GLASS.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Arctotis aureola.—This plant, with its large, orange-coloured flowers, always attracts considerable attention. It is by no means a common subject in gardens, probably because it is regarded as a difficult plant to propagate; its increase by means of cuttings is certainly difficult, but it is not generally known that it may be readily increased by means of layering. For this purpose the plants are best turned out of their pots and planted out in a bed of soil in a cold frame; or the operation may be carried out in the open. After the layers are rooted they should be potted, and stood in a cold frame, which should be kept somewhat close for a week or two until the plants are established: careful watering is essential at that stage. Other useful, although not so showy, species of Arctotis for the greenhouse are A. aspera and A. revoluta; both these species are easily increased by means of cuttings, which root readily in a cool greenhouse.

Gloxinia.—As the earlier batches of Gloxinias pass out of flower, the plants should not be neglected if it is desired to retain the tubers for next year. They may be stood in cold frames and kept supplied with water until the foliage shows signs of dying down, then water should be withheld, finally drying the plants off for the winter. For this purpose they may be turned out of their pots and the tubers stored in sand, keeping them in a warm, dry house during the winter. Young plants raised from seed this year should be potted on as they require it. If needed for the greenhouse they should be grown under fairly cool conditions; indeed, for this purpose they may be grown in cold frames, keeping them warm and close, closing the frame early in the afternoon, to trap plenty of sun heat. When Gloxinias have well filled their flowering pots with roots, they should be given diluted liquid manure and soot water on frequent occasions.

Streptocarpus.—Seedlings of Streptocarpus raised from seed sown this year should be potted on as they require it, using a light, rich compost. Such plants, if well grown, should give a good display of flowers towards the end of the summer, but they will be at their best for an early display next year. For this latter purpose they are best wintered in an intermediate house, in a light position, close to the roof glass. They should be kept moderately dry during the winter. They are very subject to attacks of mealy bug, for which a sharp watch should be kept, as once the pest spreads, it will soon ruin the plants, and be very difficult to eradicate.

THE FLOWER GARDEN.

By C. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Canterbury Bells.—Where no provision is made to have another kind of plant to replace this early flowering Campanula, every effort should be made to keep the plants in good condition, in order that they may continue flowering for as long as possible. To aid this end pick off all dead flowers as they appear, and give the roots occasional applications of manure water after having first moistened the soil with clear water. Suitable plants to have in reserve to follow Canterbury Bells are Asters, Antirrhinums, and Dwarf Nasturtiums. Another method I have successfully practised in keeping the place occupied by this flower gay, is to plant one of the Gem Pentstemons between the Canterbury Bells early in the season, so that when the latter are over the former fills the space, and they soon recover from having been somewhat cramped for a time.

Dwarf Roses.—So soon as the first crop of flowers has fallen all shoots that have flowered should be cut back to a promising bud, which, in many cases, will be already starting into growth; small, useless shoots should be removed. These operations will aid the quicker development and improve the quality of the second crop of flowers, which will continue well into the autumn. As a further means to this end, sprinkle the beds with a concentrated Rose fertiliser, then lightly prick over the ground with a fork or use the Dutch-hoe if the soil is light enough to be so moved. Should the opportunity offer apply the chemical stimulant in showery weather, otherwise it should be watered into the soil thoroughly to be of the greatest use to the plants. Roses in general are from two to three weeks late this season.

Plants in Tubs.—Where these have been in existence for a number of years, and the tubs are more or less filled with roots, it will be found an excellent plan to apply a top dressing of cow manure or sheep droppings mixed with soil, in the proportion of half soil and half manure. If the tubs are very full of roots make the mulch deeper at the outside, so that a basin-like cavity is obtained for the holding of water. The mulch, if kept moist by regular waterings, will become permeated with surface roots, and thus be a valuable aid to the plants. This practice is especially beneficial in the case of strong-growing plants, such as Agapanthus and Hydrangea.

Layering Clematis.—With a view to strengthening existing plants of this lovely climber, or to obtain more plants, a few healthy growths should be layered during the next three or four weeks. Place several inches of a stem under the ground to a depth of about 2 inches, and make secure with pegs. Cover the layered part with fine soil, and keep the soil moist until roots develop.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

Vines.—By this time the Grapes in the earliest house have in most gardens been cut, but where bunches are still hanging a little shade will be required over black Grapes to preserve the colour. The berries of Black Hamburgh quickly lose their colour if exposed to much sunlight after the fruit is ripe. The house should be freely ventilated whether the crop is cleared or not. At this time vines which are in good health usually grow freely, and the young growths require close pinching to throw as much nourishment as possible into the basal buds, for unless these buds are plump and well developed the fruiting next season will be disappointing. If the vines are infested with insect pests the present is the best time to cleanse them. If mealy bug is allowed to spread on vines it is most difficult to eradicate. Paraffin emulsion, used according to the maker's directions, is an effectual insecticide, but before using this specific it is a good plan to clear away the loose bark on the spurs, as it is in such places the pest harbours. The spurs and rods should be closely examined at frequent intervals

Digitized by Google

when the sun is shining, as it is at such times the mealy bug is on the move, and the insects may be destroyed by touching them with methylated spirits. The roots should not lack for food and moisture until the vines have completed their growth for the season.

Successional Vineries.—Mid-season vines on which the Grapes are approaching ripeness should be afforded a drier atmosphere, and a free circulation of air both day and night in order that the bloom and colour may attain their fullest density. Unless there is a sudden change to less summer-like conditions it will not be necessary to use fire-heat to keep up the temperature. Let the air in the house circulate freely and guard against an excess of moisture. Vineries in which thin-skinned grapes, such as Madresfield Court, are growing require very close attention to prevent splitting of the berries; a moisture-laden atmosphere subject to a sudden rise of temperature will bring about this trouble. Outside borders under the present conditions of the weather are better left unmulched, for to put a barrier between the sunshine and the vine roots would do more harm than good. Inside borders should be kept moist, and the condition of the soil tested, as with constant damping the surface may be moist while the under part may be dry. A small amount of ventilation at night, and an increased volume by day, until the fruit is fully ripe, should be provided. The warmth at night should range from 60° to 65° for all varieties ripening at this season, excepting Muscats, which should be afforded an additional 5°. Spiders amongst the bunches spoil the appearance of the berries if they are not promptly ejected. For this purpose a bee smoker, using brown paper, answers well, as the fumes will cause the spider to drop out of the bunch, and it may then be easily caught and destroyed. The bunches on late vines should be examined for stoneless berries, at the same time removing berries where they are crowded. The laterals should be stopped closely where crowding of the foliage is likely to occur.

THE KITCHEN GARDEN.

By R. W. THATCHER, Gardener to MARK FIRTH, Esq., Carlton Park, Market Harborough, Leicestershire.

Small Salads.—Radishes may be sown about once a fortnight to keep up a supply, and a cool shady spot is preferable during the summer months. Net the seeds against attacks of birds, and damp the bed overhead every afternoon with a rose can. Mustard and Cress may also be sown in a similar position. Sow evenly, just pressing the seeds into the soil and covering them with a wet sack until germination takes place. Thinnings from the Onion bed are also useful for salads if pulled when quite small. Watercress may also be grown for this purpose, if small trenches are taken out in a shady part of the garden, and well flooded with water previous to sowing the seed. Cover the seeds slightly with fine soil, and when the young plants appear, thin them out to a foot apart; they need plenty of water.

Parsley.—Seed of Parsley should be sown to raise plants for furnishing leaves during the winter. Sow the seed on a shady border in drills made 1 foot apart, and water the soil if the weather continues dry. When the young plants are large enough to handle they may be pricked out on any vacant ground, placing them 1 foot apart; later they may be transferred to frames or planted under a south wall. Parsley is always in request, and every effort should be made to maintain a regular supply.

French Beans.—Frames that are vacant may be utilised for growing French Beans to provide young Beans during early autumn. Should early frost destroy Scarlet Runners in the open the dwarf Beans will prove most useful. Fork the soil in the frames, and add a little fresh material. Sow the seeds about 1 foot or 15 inches apart, according to the variety. Water the seedlings copiously whilst they are growing freely, and mulch them with half-rotted manure. Draw a little soil up to each plant to keep it firm. The lights will not be needed, except at night, later in the season.

CARNATION CULTURE IN NATAL.

ENCLOSED you will find recent photographs, showing the commencement of my efforts to grow Carnations, which you are quite at liberty to use, should you think it desirable. It shows the outcome of my work since the month of November last, the plants naturally being under a year old. There are approximately 300 good plants, excluding the clump shown in the foreground in the large photo (Fig. 13), this being the consignment of about 140 recently received from Messrs. Allwood Brothers, and which are being acclimatised. I have two frames, covered with hessian, and resting upon legs 15 inches long. These are used to shelter the young plants from the frost. They also afford a covering when the sun is inclined to be hot during the middle of the day. The hessian, being thin and not too tightly woven, admits just enough sun to strengthen the young plants.

As will be clearly seen, all the beds are 6 inches to 8 inches above the general level, to allow free drainage. The ground is not quite level; it slopes towards the front, thereby carrying away quickly any surplus water from our deluges in summer.

The plants are not in tins, but each one is encased in four pieces of flat, galvanised iron, 2 inches in height, 10 inches in length and set 1½ inch into the ground, the plant being in the centre; the prepared soil is brought almost flush with the top of the iron. This allows me to apply a fertiliser without it always being washed away by the heavy rains. It is not altogether an ingenious device, but it certainly keeps the fertiliser in its proper place. The contrivance has, so far, worked admirably, and it has the effect of keeping one good-tempered after a downpour. A round kind of "container" would be better, but it would mean a tinsmith's job, and considerably enhance the cost of carrying out this idea. The cutting and the measuring of the iron takes up a little time, but there is the satisfaction of an ample reward in due course. You will readily agree that it would be heart-breaking to find your specially prepared soil being carried off into the street gutter! "Success is not an accident, it comes to those who deserve it." Yea, verily it is so.

The Allwood patent wire supports are in use; they are most effective and save an infinite amount of time.

The small heaps, like ant-hills, in the foreground of the photograph are of prepared soil, showing exactly how each bed is made up before being finally levelled off with soil passed through a fairly coarse sieve. The short sticks in the soil indicate where the young plants will be put into their permanent places.

You will be glad to learn that out of the consignment referred to only three plants died; they were Duchess of Wellington, May Day, and Snowstorm. Effie Dean is growing nicely from the half-inch stem which was left, and I think it is on the way to complete recovery. I consider that I have been extremely fortunate in only losing three plants, and I am sure it is owing to the clever packing that I have had such good fortune.

All the plants are now growing splendidly. I am already deriving untold pleasure from the way in which they are "looking up"; but how much greater will this be when they commence to bloom! *G. Sackville-West, Pietermaritzburg, Natal.*

FIG. 13.—THE CULTIVATION OF PERPETUAL-FLOWERING CARNATIONS IN RAISED BEDS AT PIETERMARITZBURG.

OLD AND NEW PINKS.

THE tide of popular favour is noticeably turning to-day to the cultivation of the garden Pink. In the middle of the last century—that is to say, from 1830 to 1870—there existed among gardeners an enthusiasm for raising and exhibiting the laced varieties at local shows, such as in later years has been shown by societies established for the exhibition of Roses, Dahlias, Carnations, Sweet Peas, and other flowers. Connoisseurs of that period were then to be seen scrutinising through a magnifying glass the lacing of the petals of flowers 2½ to inches in diameter, and searching for defective formation with a minuteness which to-day

Digitized by Google

would create smiles. The methods used to produce flowers of that size involved much labour, time, trouble, and cost, so that it is no wonder, with other flowers competing for favour, the Pink received decreasing attention.

To-day it is difficult to procure from the trade any one of these old kinds whose beauty and freedom of flowering, when grown naturally, are at least equal to the best among modern varieties, and it is to be deplored—beautiful as the modern Pinks undoubtedly are—that the old varieties, which were considered the best at the time when competition for beauty and form were so exacting, should have been allowed slowly and gradually to disappear.

Many of these old sorts exist in out-of-the-way places, country-cottage gardens, and allotments. It is from these sources it is hoped that, as a matter of business, the nurserymen of to-day may be induced to recover them. There is ample room in gardens for both old and modern kinds. Beginners in gardening are often first attracted by the Pink and the Carnation. Orders for a dozen kinds in variety, and even two dozen, are still forthcoming, taxing the resources of the modern nurseryman.

As an instance of what may be done, the writer may relate an experience of his own. Having business in Scotland some three years ago, I noticed an unusually pretty Pink among the flowers decorating an hotel table. Inquiry yielded the name of the nurseryman from whom cuttings were procured. Two years later the variety was recognised as Sarah, one of the best old laced kinds to be found in the lists of Pinks recommended and selected by gardening authorities like James Douglas and Richard Dean. Where are Anne Boleyn, Ascot, Derby Day, Lord Lyons, Newmarket, and Rubens—sorts which were so good and floriferous as to be selected for forcing in pots—and the laced kinds, Bertram, Bayard, Harry Hooper, John Ball, Reliance, and many more which might be named? Unhappily we need not go so far back for such losses as these varieties denote, for the comparatively modern and beautiful variety Ernest Ladhams, which received an Award of Merit from the Royal Horticultural Society in 1893, is unobtainable from the trade and even from the firm which raised it. Thus in less than thirty years a beautiful flower has been raised and lost.

It is suggested that nurserymen should endeavour to recover the best of the old kinds by local inquiries for Pinks grown in the district where their trade is carried on. A line in a trade catalogue that varieties would be exchanged might effect a great deal. A good flower sells itself, and there is no question that many of the old Pinks would attract modern buyers. Perhaps a more successful result would be achieved if the Royal Horticultural Society notified its members that plants or cuttings sent to its gardens at Wisley would be welcomed for cultivation and exhibition alongside varieties of Dianthus Allwoodii now freely grown there. Curiosity and interest in old and new sorts would be stimulated and the plants be a source of increasing beauty in private and public gardens. *C. H. Cope.*

PLANT NOTES.

STATICE SUWOROWI.

THIS extremely elegant annual is of great value for massed bedding, conservatory decoration, or supplying cut blooms. Like many annuals it is by no means difficult to grow.

A well-grown batch shown by a firm of northern seedsmen at the Royal Agricultural Society's Show at Newcastle-on-Tyne was stated to have been raised from seed sown during the last week in March, and at the date of the show the plants had then been in bloom for three weeks and looked good for at least another month.

The seed, which is usually received uncleaned of the dead bloom, should be sown fairly thinly and pressed into the seed tray of well firmed sandy compost. A very light covering is advisable, and germination is freest in a temperature of 55° Fahr.

For growing out of doors the seedlings should be pricked off into trays and kept on the dry side until they are established, after which they may be grown in a cold frame in preparation for planting out in May or June. The plant prefers sun, but will do well in a semi-shaded position.

For pot culture, the potting medium used should be good and the drainage efficient. Five plants in a 6½-inch pot should be capable of producing a well-furnished appearance, with spikes of pale rose bloom up to 3 feet in height, well set off by the delicate green of the rather tender foliage.

Seeds may be sown now for an autumn display in the conservatory. *G. R. S.*

FOXGLOVES.

AFTER the flowering of early shrubs, etc., is over, bare places in the shrubbery and hardy herbaceous border may be made gay with Foxgloves. A good strain of seed will give plants of many shades of colour, and amongst the shrubs and in open spots Foxgloves when in bloom have a very pleasing effect. The seed is cheap and may be sown at this time in beds, the seedlings to be lifted and planted later, or the seed may be sown where the plants are required to bloom.

Established plants shed seeds freely, and numerous seedlings will spring up annually with no further trouble. For brightening and relieving the dullness of many open spaces, and where other plants have failed, few if any flowers are equal to a good strain of Foxgloves, both for showiness and ease of culture. There is no fear of the plants being destroyed by rabbits, as is the case with many other plants in woods and shrubberies. *H. Markham, Wrotham Park Gardens, Barnet.*

IRISES.

IRIS KAEMPFERI.

THE genus Iris is remarkable for its richly-marked and beautifully-coloured flowers, and these characteristics are highly exemplified in Iris Kaempferi, one of the finest members of the family.

It is difficult to imagine anything more beautiful than large masses of these beautiful flowers in the lake garden, as at Pyrford Court. The plants are usually in their best condition throughout the month of June, but this season their flowering is somewhat later. Our garden of Japanese Irises is a scene of subdued colours, the magnificent blossoms ranging from pure white through every shade of mauve and lilac to rosy purple and intensely deep blue. Some sorts are pure white, others delicately veined with a tinge of green; some have a margin of lilac or lavender, some are shaded, some mottled, while many and probably the most beautiful are the large, self-coloured flowers of lilac, lavender, or blue. The variety Pyrford Gem, illustrated in Fig. 12, p. 35, has purple veining on a white ground, the purple passing to blue at the base, where there is a yellow blotch. The standards are claret purple.

Iris Kaempferi grows best in a deep, rich, moist soil. Japanese cultivators have a system of irrigating the beds, but this is not necessary in this country; deep cultivation and mulching during the growing season are, however, essential.

The plantations here were made by the lake side, where the roots can easily find water, but the lake dried out completely in 1921 and was not refilled until the spring of this year. This left the Iris beds at least 2 feet above the water-table, yet in spite of the abnormally low rainfall of the past two years they continue to flourish

Propagation is easily effected by seeds, and the raising of seedlings is a fascinating method of increasing the stock. If seed is sown as soon as it is ripe germination takes place quickly, and a large proportion of the plants flower in the second year. The old root stocks may also be divided, and this should be done in late summer or early autumn after the flowering period is over. *W. Anton, Pyrford Court Gardens, Woking.*

HARDY FLOWER BORDER.

DWARF KNIPHOFIAS.

DURING the last few years numbers of new varieties of dwarf Red Hot Pokers have been raised and some of the early-flowering kinds have a definite value, inasmuch as with them the season for these handsome plants commences in early June, instead of a month or six weeks later, from which time a succession may be maintained until autumn.

The value of these pigmy Kniphofias to the rock-gardener cannot be overrated, and they are not less useful in the border. Their handsome, Pampas-grass-like foliage, generally of a rich, glossy green, and the elegant, upstanding flower spikes of some 2 feet in stature which blaze into bright heads of fiery vermilion, scarlet, yellow or coral-red, help not only to give emphasis and character to plantings of lowlier subjects, but to afford a most brilliant display of unusual colouring.

Among the earlier of these dwarf Kniphofias may be mentioned rufa, clear yellow with a red tip; Goldelse Improved, rich yellow self; Prince of Orange, rich orange; brevifolia, bright red and yellow; and the July-flowering K. Nelsonii, a charming, dwarf species with crimson and orange spikes and remarkably fine foliage.

None of these grows much above 2 feet tall, and in some soils they may not attain that height. The plants bloom freely not only in full summer, but maintain a succession of spikes for several months. Any freely-drained soil in full exposure to the sun will suit them and, once established, they appear to be quite hardy in all but cold soils and very bleak localities. Propagation is easily effected by detaching and replanting offsets. *A. T. J.*

THE ALPINE GARDEN.

ASTER FARRERI.

THE Aster family is so large in itself and has given birth to so many varieties and hybrids that the choice among the different sections is almost unlimited. Apart from the late-flowering ones, popularly called Michaelmas Daisies, we have now quite a number of earlier bloomers, especially varieties of A. alpinus. I observe certain folk class Aster Farreri among the forms of A. alpinus, but it is recognised, I believe, as a distinct species, and I am not inclined to disagree with this view. For all garden purposes it is a bolder and more imposing subject than most of the alpinus forms, and is not only a good rock plant, but is fine in the border. A plant which reaches a height of one foot can always be advantageously employed in the latter.

The merit of A. Farreri is so great that it should not be overlooked when considering what additions should be made to the garden. It has long, narrow, rather pointed leaves, stems clad sufficiently with leaflets and bearing very large flowers of a fine, deep violet blue, prettily fringed and with the colouring enhanced by the vermilion-orange of the disc. It is a native of grassy slopes in Northern China, and seems to be hardy with us. Its chief danger will probably be from slugs. *S. Arnott.*

MECONOPSIS CAMBRICA.

DESPITE the undoubted merits of the Welsh Poppy, a plant very beautiful both in flower and foliage, it is not a subject that any person of discretion would introduce into the rock-garden, dry wall or other place where its abounding colonising enterprise would be likely to prove too aggressive for choicer plants. It is, nevertheless, a fine subject for cool woodland slopes and walls, old ruins or the stream-side, where it associates well, and easily holds its own, with Ivy, Ferns, Foxgloves, and other native herbage.

There is a form of this Poppy with large flowers of a tawny orange colour, which does not appear to be nearly so rampant a grower, and there are also double varieties. During the past few years very marked improvements have been made in these latter, the almost

Digitized by Google

spherical heads of blossom being large and of good texture, and ranging in colour from pale citron yellow to a deep, warm orange, with or without flecks and marginal shadings of bronze and crimson.

M. cambrica is a true perennial, and though the same may be said of the doubles, these do not seem to be quite so permanent in all soils as the type. *A. T. J.*

GYPSOPHILA CERASTIOIDES.

As one who has long appreciated the beauty of Gypsophila cerastioides, an old favourite alpine, and still one of the best of these fascinating flowers, it was a peculiar pleasure to me to see a grand plant in the rock garden at Kew recently. I do not remember ever having seen one finer, and certainly it was vastly better than the majority found in even the best alpine gardens.

It was a large specimen and covered with exquisite white flowers, with their charming lines which add beauty to the little blooms.

In many ways G. cerastioides is quite distinct from most members of the family to which it belongs. It is not a trailer, like G. prostrata, nor is it a tall grower like the popular G. paniculata or others of its class. On the contrary, it forms a low carpet of small, greyish leaves, thick-set, where it does well, with its bonny flowers, which are larger than the individual blooms of G. paniculata.

The plant appears to favour lime or chalk in the soil, and a sunny position is desirable, although I have grown it fairly successfully in a north-west aspect. It is an old plant in alpine gardens, but is not at present much grown, this being probably due to the introduction of so many new plants. It does not, however, deserve this neglect.

POTENTILLA TONGUEI.

I HAVE no precise record of the origin of this pretty, dwarf, hybrid Potentilla, but it has been in cultivation for many years, and, so far as I can discover, I consider that it must have originated in the forties of the last century. It says a good deal for its value that it has survived for so many years, and that it is still in commerce, though not at all plentiful compared to what one might expect. I have known it for more than forty years, and have always appreciated its low, rather trailing habit and its beautiful flowers of orange and terra-cotta. It is not difficult to cultivate on the level parts of an ordinary rock garden, but appears to resent being placed in a position where it will become parched in dry summers, without being treated to a plentiful soaking of water now and then. It is increased by division. I first saw it in the garden of a veteran alpinist who looked upon it as one of his best flowers, and he had a very choice collection of the best flowers of the day.

ALYSSUM SPINOSUM.

THE valuable, silvery-leaved Alyssum spinosum was seen in several trade exhibits at the recent Chelsea show, and was evidently appreciated by visitors. But the little plants necessarily shown did not give any true idea of the effect of this Alyssum, when it has been established for some time. A specimen some six or nine inches across is hardly representative of a plant which will grow three feet in diameter. It is, when once established, free-growing, and forms a dense, silvery mound, giving in summer a wealth of small, creamy-white flowers. It may be planted on a level spot; hanging down over stones; or when small, placed in the chinks of a wall-garden and allowed to develop into a large specimen.

It has a defect, however, when it becomes very large, of becoming dead in the centre, but this is only after the lapse of a good many years. Young plants may easily be raised from seeds, or from cuttings rooted in sandy soil under glass.

Alyssum spinosum is quite hardy. There is a rose-coloured variety, which was sent out a few years ago. It is not, however, bright in colour, and is no improvement on the type. *S. Arnott.*

PYLEWELL PARK.

PYLEWELL PARK, the seat of W. Ingham Whitaker, Esq., is about two miles east of Lymington, Hampshire, and contains a magnificent collection of rare shrubs, many of which were planted a good many years ago, and also a collection of new Rhododendron species and hybrids.

The first plants I noticed during a recent visit were Lapageria rosea on a north wall, and Myosotidium nobile at the base of a wall—one on each side of the door into the kitchen garden. This was the first time I had seen this plant in flower.

Passing the glasshouses, I noticed a fine lot of Carnations in full bloom, and quite the finest was a pink seedling raised by the able gardener, Mr. Hamilton; it has great substance of flower-stem and foliage, and it stands out from all the other varieties. Outside was a bed of seedling Aquilegias, several of which appeared exceptionally fine. Passing on towards the house, there is a sheltered wall, facing south or thereabouts, covered with uncommon shrubs. I noticed Feijowa Sellowiana in fine form; Adenocarpus, Westringia rosmariniformis, Sphacele Lindleyi, Abelia longituba (?), Cassia corymbosa, Teucrium latifolium, and many others. Close by were many new shrubs planted in small beds, with a fine specimen of Tricuspidaria lanceolata in the background. A fine specimen of Bignonia radicans adorns the front of the house, and Rosa Moyesii was particularly good.

To the west of the house there is a very pretty sunk garden; the colour scheme is pink and lavender. Turning back to the shrub garden, I noticed a magnificent specimen of Acacia dealbata, which must be a wonderful sight when in full bloom. After the hot summer of 1921, there was a great show of flowers in 1922. Several Berberis species, many Olearia and Senecio species are planted here, and Ceratostigma Willmottiana, big bushes of Grevillea rosmarinifolia and G. sulphurea, and Fagus Cunninghamii were interesting. Other fine plants were Escallonia organensis, Cornus florida rubra, a fine specimen of Drimys Winteri, Osteomeles anthyllidifolia, a big Pittosporum Buchanani, Ceanothus thyrsiflorus—very bright and effective—Leptospermum Chapmanni, 7 feet or 8 feet high, just opening, promised to be a glorious sight, and L. Nichollii, nearly as big, was close by. But I thought the finest sight was a wonderful specimen of Tricuspidaria lanceolata, perhaps 20 feet high, a broad and shapely specimen, carrying thousands of its red, Chinese-lantern-like blooms. It was worth a long journey to see this. Near the lake a fine Embothrium coccineum was in full bloom, and on the right-hand side, in a cool, shady, moist position, a wonderful batch of Primula helodoxa looked particularly well. Lower down was a big bed of Primula Lissadell Hybrid and other varieties. All round the water's edge were plantings of Primula japonica, P. pulverulenta, etc.

Leaving the water and climbing the slope, I found under the big oaks, sheltered by belts of Rhododendron ponticum, the collection of Rhododendrons that Mr. Hamilton is getting together. Not being a Rhododendron specialist, I can write little about individual species, but I thought the plants looked very well in the soil, which seems to be leaf soil over a gravel subsoil. I noticed specimens of R. Loderi and R. Loder's white, and species with gigantic foliage. I saw the nursery beds full of young plants that Mr. Hamilton has raised, and on my way back noticed two more nursery plantings, all under numbers. One of the glasshouses contains a fine plant of Lonicera Hildebrandti; I thought this would have grown outside in a sheltered corner of Pylewell, as it grows out in the open near Minehead! There was also Mandevillea suaveolens in full bloom, and Clianthus puniceus in flower on one of the walls outside. *G. H. Dalrymple.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 5, Tavistock Street, Covent Garden, W.C.2.

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters, and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.*

No. 18.—OVER THE SI LA.

ON October 12 we set out for the Salween—seven Tibetan porters, my Chinese cook Las Li, and myself. The weather was beautifully fine—too brilliant to last, in fact; but the rains were over, and we had nothing to fear for a fortnight or three weeks, at any rate. Twice before I had crossed the Si La, but that was some years ago now, and it always holds fresh surprises.

Ascending through Pine forest, we found scattered bushes of Oak, Rhododendron decorum, and other woody plants. There was an undergrowth of Bracken and grass, where a few flowers yet bloomed, a pale-cheeked Adenophora, and a Gentian with rosy purple flowers being conspicuous. This flank of the range catches the sun, and Pine forest replaces the denser and more varied forest of the sheltered slopes; in both cases tree growth descends to the water's edge.

In the afternoon we reached the Tra-na La, 4,151 feet above the river. Crossing the spur, we descended through mixed forest to the torrent and camped. We were now in a deep, sheltered valley, amidst the most varied vegetation. It was not, however, like the "temperate rain forest" of the north-east frontier of Burma. Amongst the more conspicuous trees were Birch, Maple, Magnolia, Pyrus, Yew, Holly, and Euonymus; while towering over all were magnificent Pseudotsugas. Large bushes and trees of Rhododendron argenteum (?) formed shapeless masses. There were Vines and Clematis and other climbers, and, of course, much larger-leafed undergrowth—Arisaema (trilobed leaf), Rodgersia, Lilium giganteum, Begonia, clusters of purple Impatiens, and thickets of Strobilanthes, besides many Ferns. But the undergrowth was moribund or decomposed; the leaves were whirling down from the trees, orange, scarlet, yellow; the split capsules were freeing their seeds; and the fleshy fruits were displaying themselves in bright colours to the birds. Incidentally, I may remark, I have never seen a bird touch the conspicuous red fruits of an Arisaema, and until one actually sees it in any given case it is purely an assumption to say that birds distribute the seeds.

The following day we marched up the valley through forest which grew richer and ever richer in Rhododendrons and poorer in deciduous-leafed trees. Picea replaced Pseudotsuga. Birch trees held out till the meadows were reached, where thickets of Rhododendron and Willow alternated with patches of forest. Ascending the valley, terrace by terrace, after climbing the steep pitches between, we suddenly emerged into the ice-worn alpine zone at the head of the cwm. In the summer it is a gorgeous bog garden, rock garden, and meadow. Now it was bleak and colourless. A dozen species of Rhododendron appeared like magic—bushes of purple-flowered R. brevistylum, or "rusty leaf," as I call it; R. sanguineum, R. pagophyllum, species of the Neriiflorum and Haematodes groups, and many more. However, there was no chance of finding anything new here, though I gathered seed as I went along.

Ascending the great rock wall of the Si La, other species appeared, notably the prostrate R. repens of the Forrestii group. There were very few flowers anywhere, but more in the open alpine region than in the forest; some yellow Saxifrages, Senecio, Gentians, Geranium, and Aster. As for Primulas, there were P. serratifolia, P. Souliei, P. sikkimensis, and others.

In the afternoon we reached the pass, between 14,000 feet and 15,000 feet, and descended to a deeply eroded valley. The west flank faces south-west, and at this altitude possesses quite a different flora to the sheltered flank by which we had ascended. There was a Meconopsis here, and Primula bella, but not a single Rhododendron until we got much farther down.

In the valley were a number of plants actually in bloom, including Primula serratifolia, with masses of golden Trollius and a gamboge-coloured Potentilla, with strikingly large flowers. Primula muscarioides was barely over, but the group is poorly represented in this area.

After a minimum temperature, under the trees, of 33°, the day dawned perfectly clear. Water splashed and slid over the cliffs all round us. Crossing the stream, we began the ascent of the next ridge, where patches of forest alternated with thickets of Ribes, Rubus and Bamboo. The trees were mostly Birch, festooned with lichen which swayed like lace in the breeze. Herbs attained a height of 7 feet here—species of Strobilanthes, Thalictrum, Astilbe, Rodgersia, Polygonum, Aconitum, and several Umbelliferae, forming the undergrowth of the Birch forest. Higher up, Abies and Rhododendron replaced Birch forest, the latter forming dense shrubberies. There were pools of peaty water in the ice-worn hollows surrounded by meads; the dry haulms of dead flowers twitched in the gusty wind. No trees grew in these boggy places. The Rhododendron bushes were "smutty twig" and "giant rose," both of which are found so far east as Mu-li—or species so near them as to be indistinguishable, except by means of the microscope.

In the Abies forest, towards the summit of the ridge, two species of Primula—P. vernicosa, one of the Sonchifolia group, and a Nivalis Primula—were found. The former is a miserable little thing, with two or three white flowers, which open very early in the snow. I saw no trace of it on this occasion, but this is the *locus classicus* where I discovered it in 1911. The Nivalis form was in seed, and I gathered a little of it, though it has been sent home before.

The pass here—a notch in the razor-back—is called sonorously Nyi-ser-ri-go—that is to say, "the top of the mountain of yellow Bamboo." We had a good view of the snow-peak called Gompa La, on the Salween-Irrawaddy divide, from here. Descending towards the Salween, we came on sloping lawns, dotted with low bushes of an Intricatum Rhododendron. Then, leaving the Abies forest, we came down to grassy alps, and, lower down still, to park-like slopes, flecked with Alder and Pine trees. A ruck of Bracken and coarse herbs—Anemone vitifolia, Scabiosa sp., Nomocharis, etc., surged waist-high under the scattered trees, but this only on sunny slopes. Immediately over the crest of the ridge, and filling every gully, is dense forest, big trees in the drier places, impenetrable Bamboo where the slopes become moister. There are Oaks, Maple, Schima, Ailanthus, Picea, and Pseudotsuga, the Conifers in particular growing to a huge size. But the most striking tree is undoubtedly Rhododendron sino-grande, which in the depths of the forest may grow 50 feet or 60 feet high, but which on the outer rim is a gnarled tree not exceeding 30 feet. The leaves, brightly silvered below, are immense; one I measured from a moderate-sized tree being 21 inches long, excluding the 3-inch petiole, and 8 inches wide; but they run considerably larger than that. The rust-coloured capsules, too, are of large size, averaging nearly 3 inches long and fat in proportion. Unfortunately, they are greatly favoured by a caterpillar which causes havoc amongst the large, winged seeds. Only one of the Grande series is known from east of the Yang-tze (K.W. 4509); they are almost entirely confined to the rain forests of the west. As a matter of fact, I am not sure that K.W. 4509 is a Grande at all—it may be a Hodgsoni.

A common twiner amongst the Bamboo and undergrowth is a species of Crawfurdia, whose thread-like stems are hung all the way up with small, polony-like fruits, filled with black seeds. These, too, harboured grubs. It is a widely distributed species, found also at Mu-li and in the Hpimaw Hills. We were entering a region where life is abundant, and its destruction equally so. In the afternoon we reached the village of Bahang, still a day's march from the Salween; I spent three days here with the French priest, collecting porters for the difficult journey to the Taron. The weather was brilliant, and a fine spell had certainly set in.

(In February I was so fortunate as to return to England on the same boat as Mr. Forrest. Curiously enough, we got talking about plants! I was able to show him some of my Rhododendron specimens. For the names of many in this article and in future articles I am indebted to him). *F. Kingdon Ward.*

* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, 29, 1921; January 7, 21, March 11, 25, April 8, 22, May 6, 20, June 3, 17, July 1, 15, 22, August 5, 26, September 9, 23, October 7, 21, November 4, 18, December 2, 16, 30, 1922; January 13, 27, February 10, 24, March 10, 24, April 7, 21, May 5, June 2, 23, and July 7, 1923.

THE TERCENTENARY OF GASPARD BAUHIN'S "PINAX," 1623.

THIS year the literary world is celebrating the tercentenary of the publication of the first folio of Shakespeare's plays; and although it is not possible to claim many scientific works as worthy of a similar honour, there is one which perhaps deserves our notice. Three hundred years ago a book was published at Basle, Switzerland, which had an immense influence on the nomenclature of plants; and although the march of scientific thought has long ago swept past it (how unlike the immortal plays!), yet even to-day, to the student of botanical history, it is a mine of wealth. Gaspard Bauhin's *Pinax theatri botanici*, etc., represented the careful research of forty years. The word *pinax* means register; and the book is a wonderful compilation of all the synonyms used by previous writers, commencing with Theophrastus and Dioscorides. It is, however, more than that, for in place of the alphabetical arrangement usually adopted by the herbalists, Bauhin grouped his plants by their natural affinities, so far as it was possible to do so by the limited scientific knowledge at his command. Further, throughout the book a distinct preference is shown for using only two words for a plant name; thus foreshadowing the binomial nomenclature that Linnaeus made law at a later date. In reducing the chaos of plant names to a rational order, the *Pinax* conferred a great benefit on succeeding botanists, many of whom have left on record the high esteem with which they regarded it.

Gaspard Bauhin was a member of a family of physicians that flourished in France and Switzerland for over two centuries. He was born in 1560, and died in 1624. His father had left his native town, Amiens, on account of religious persecution, and his two sons, Jean and Gaspard, were born in Switzerland. Gaspard, fifteen years younger than his brother Jean, was destined to become the more famous of the two. However, Jean Bauhin deserves remembrance as the author of the *Historia plantarum universalis*, published posthumously by his son-in-law, J. H. Cherler, in three large folio volumes: also for a smaller work published by him in 1598, entitled *Historia novi et admirabilis fontis balneique Bollensis*, etc., which is far more than a description of the medicinal baths

Digitized by Google

of Boll, in Würtemberg, including, in fact, a remarkable account of the local natural history, as well as numerous woodcuts of the various kinds of fruit to be found in the orchards. The published works of Gaspard Bauhin include his *Phytopinax, seu enumeratio plantarum*, 1596, which contains a description of the Potato plant but without an illustration), ante-dating Gerard by one year; his *Prodromos theatri botanici*, 1620, containing many new species; and new editions of Mattioli's *Opera omnia*, and Tabernaemontanus' herbal. He had projected a great *Theatrum plantarum*, but this, with the exception of one part, was never published; and his fame chiefly rests upon the *Pinax* of 1623.

An excellent example of the influence of the *Pinax* upon a celebrated later botanist is afforded by a copy of the second edition (1671) now in the library of the Linnean Society of London. This copy belonged to Linnaeus, and has been profusely annotated by him with the plant names adopted by himself. It reminds us that behind the lawgiver of modern botanical nomenclature stood the monument raised by the labours of Gaspard Bauhin. Linnaeus received the book from a fellow student, Carl Gustaf Warmholtz, in 1730, the year in which he became demonstrator in the botanic garden of Upsala University, as a MS. note upon the fly-page testifies: and Dr. B Daydon Jackson. Gen. Sec. L.S., tells me that it is on record elsewhere that Linnaeus received this book in part-payment for special coaching in botany rendered to his friend Warmholtz; also, that the copious annotations must have been added at a much later date than 1730. Linnaeus also possessed a copy of the 1623 edition, which, judging from a pencil note on the fly-page, he purchased in 1740, but left unannotated. According to Pritzel, a copy annotated by the elder De Candolle is preserved in the library of the De Candolle herbarium at Geneva.

In conclusion, it may be added that Linnaeus founded the genus Bauhinia in honour of the author of the *Pinax* and his brother Jean. *S. Savage.*

PLANTS NEW OR NOTEWORTHY.

RHODODENDRON DAURICUM VAR. MUCRONULATUM.

THIS is one of the most beautiful and dependable of spring-flowering plants grown in the Arnold Arboretum (Fig. 15). It never fails to put forth each year a wealth of lovely blossoms, which vary in colour from rosy-pink to rose-purple. These flowers are remarkably resistant to frost, much more so than those of the typical R. dauricum, or, indeed, of any other early-flowering Rhododendron. This variety may be regarded as the south-eastern form of the species, being common in continental north-eastern Asia from the valley of the Amur southward. It is especially abundant in Korea, from the mountains of the extreme north to the island of Quelpaert in the south. It occurs in Hokkaido, where it is rare, and finds the western limits of its range in the Chinese province of Chihli. It is a common undergrowth in the open Larch-forests on the volcanic soils of north Korea, where it is often ten feet tall. Its leaves are pleasantly fragrant when crushed or dried, like those of R. dauricum, and the autumn tints are similar. In Korea it is one of the first shrubs to open its flowers in the spring, and being everywhere abundant—in open rocky country, mountain slopes, cliffs and woodlands—is a prominent feature of the vegetation.

R. dauricum var. mucronulatum is well distinguished from the type by its larger, less coriaceous leaves, which are sometimes nearly three inches long and 1½ inches wide, and usually pale on the underside with crenate-serrate margin. The flowers are larger, being often 1¾ inches across, of a more pleasing shade, and sometimes the lobes are not so deeply cleft and consequently the flower is less flattened and more bell-shaped.

This useful plant was discovered on Po-hua-shan, a mountain west of Peking, by Dr. P. Y. Kirilow, about 1835, and introduced into cultivation by Dr. Bretschneider, who sent seeds from the type locality to the Arnold Arboretum in 1882. It flowered for the first time in the spring of 1888, and each season since it has never failed to cover itself with flowers in the spring, and with a cheerful mass of tinted leaves in the autumn. For the gardens of eastern North America, it is a first-rate plant. *E. H. Wilson, Arnold Arboretum, Harvard University.*

FIG. 15.—RHODODENDRON DAURICUM MUCRONULATUM.

TREES AND SHRUBS.

THE CYPRESSES OF MONTEREY.

THOUGH the Monterey Cypress (Cupressus macrocarpa) is so well known in all parts of the world possessing a climate that is other than severe, it does not appear to be common knowledge that this noble and useful species is represented in the wild state by only a few storm-beaten trees scattered over less than a square mile of ground on the Monterey Peninsula of California. In no other part of the world does C. macrocarpa grow as an indigenous species, and the little territory which it now exclusively occupies consists of two narrow, rocky headlands which stand boldly out to sea on either side of the estuary of the Carmello River.

It is evident that this little group of trees is but the remnant of a vast forest which has gradually been engulfed by the sea, and when one realises that hardly a season passes without some few of these surviving trees being claimed by the devouring waters one cannot doubt but that the whole of this ancestral grove will have vanished before very long. For it is no ordinary sea that rages against the wall and buttress of this little colony with such eternal persistence, but a sea which is daily whipped to a fury so intense that the rising spray will obscure the noon-day sun and, driving across the wilderness of shifting sands to landward, turn to a

Digitized by Google

dull brown the fringe of the Pines (P. insignis), which crown with their rugged gloom the summit of the distant Head of Monterey.

So different are the Cypresses of this handful of storm-broken survivors to the trees of the same kind which enjoy the vigour of youth and the sheltering care of our parks and gardens that one would hardly believe them to belong to the same species; and for that reason one might, perhaps, even excuse the picturesque imagination of the local post-card maker who disseminates the popular fiction that the trees are Cedars of Lebanon! Indeed, these historic Cypresses, seen against the white rocks to which they cling, or standing in the ever-drifting sand which is even whiter than the rocks, do bear a closer resemblance to the classical trees of some old master's canvas than to those of any living forest.

Fantastic in shape, their trunks often curiously flattened and their crowns broken as if crushed by the burden of some invisible weight, they loom darkly silhouetted against their white surroundings. Clipped by the eternal bite of the salt spray, their once slender and elegant boughs have bulged and thickened into cushiony buffers, as if the better to resist the onslaughts of their untiring enemy. Some trees in little isolated groups lie cowering and wrecked in huddled confusion where the wind has cast them down, a heap of strangely contorted limbs which here and there make brave but futile efforts towards restoration by breaking afresh into tufty pads of verdure. Again, one may emerge from the shadowy gloom of a few trees which have benefited by the shelter afforded by their stricken companions, to come upon another colony, every tree of which stands rigid and dead whilst through their naked and tattered rigging, which is bleached as a weathered bone, the grey spray drives with a ghostly sound.

Leagues of this primeval forest have, as I have said, been engulfed by the sea, and the width of the fringe still standing does not measure a quarter of a mile at its widest part. Had it not been for the rocks in which the survivors are now entrenched civilised man would never have seen Cupressus macrocarpa. The species would have passed, as other species have passed, unknown to science and history. And although it is unlikely that the present generation, or the next, will witness the final surrender of these aboriginal Cypresses to the conquering ocean, the hour will come when the last stalwart must yield. Like the days of the shore Indians, who once ate their clams and burned the Willow bark in the dark shades of the primeval Cypress forest, and who are now a fast vanishing race, so the days of the Cypresses of Monterey will come to an end and the only traces of their natural habitat will be found in books and records. *A. T. Johnson.*

LABURNUMS IN THE UNITED STATES.

LABURNUMS, small European trees or large shrubs, sometimes called "Golden Rain," can furnish gardens in June and early July with the handsomest yellow-flowered trees which may be grown in the United States. The best known Laburnum in America, according to the *Bulletin of Popular Information*, issued by the Arnold Arboretum, is Laburnum anagyroides, or as it is more often called Laburnum vulgare. This is a native of central and southern Europe, and a shapely tree from twenty to thirty feet in height. It is one of the most generally planted and popular exotic plants in England, and probably was brought early to the United States, where it has been more generally planted than the other Laburnums. Although not always perfectly hardy in Massachusetts, large plants are occasionally found in the neighbourhood of Boston, and these have been covered with their drooping racemes of golden-coloured flowers.

A number of varieties of Laburnum anagyroides are propagated in European nurseries, but these are curiosities, and certainly not better as garden plants than the type of the species. One of the most distinct of the abnormal forms, var. bullatum, with its curiously twisted and contorted leaflets is now in bloom in the Arboretum. The Scotch Laburnum (L. alpinum), probably so called because it is a most cultivated and favourite garden plant in Scotland, flowers later than L. anagyroides, and is a hardier plant in this part of the country, with longer racemes of flowers. When the plants growing in the Arboretum are covered with their long drooping flower clusters they are objects of great beauty, and it is surprising how little this plant is known to American garden makers. Another Laburnum, L. Watereri, a natural hybrid between L. alpinum and L. anagyroides, which is intermediate between its parents in botanical characters and in the time of flowering, and is a beautiful small tree, better suited to the New Zealand climate than L. anagyroides, and a good plant for the decoration of a June garden. L. Watereri appears to be little known in America. The third species of Laburnum, L. caramanicum, a native of Greece and Asia Minor, has been planted in the Arnold Arboretum but has not proved hardy there.

CORDYLINE AUSTRALIS IN SOUTH WEST SCOTLAND.

IN the inland districts of the south-west of Scotland Cordyline australis cannot be called a success, but matters are different in gardens near the sea, especially where there is some shelter from strong winds. There are some very fine examples of this Cordyline in certain Wigtownshire gardens, for example, such as in that of Sir Herbert Maxwell, at Monreith, and in that of Mr. Kenneth M'Douall, at Logan, those in the latter place being magnificent specimens, and very numerous. In Logan gardens there are some fine rows of great, stately plants many feet high; and their sheltered position gives them a splendid chance of continuing to do well. C. australis flowers and fruits well at both Monreith and Logan, and it is rather unfortunate the plant is not equally successful inland. I do not know of any really good specimen in an inland garden in the south-west of Scotland, but I know some places where it has been tried several times, but has succumbed in winter. *S. Arnott.*

NOTICES OF BOOKS.

Poisonous Plants of all Countries.*

THIS is an octavo book of 112 pages, including a good index. It may be regarded as a technical book on the subject, intended for the use of doctors, medical men generally, and chemists, as a book of reference. A very large number of plants is dealt with, but the information is confined to a brief description of the plant, popular names, a reduced drawing of the same, the name of the plant, the natural order to which it belongs and the toxic principles it contains. There is a classification of the poisons under such headings as "Acting on the Brain," "Acting on the Spinal Cord," "Acting on the Heart," etc. These are subdivided into narcotics, deliriants, inebriants, convulsives, depressants, asthenics, etc., and would be useful in diagnosing cases of poisoning. In other respects the book does not appeal to the lay reader, because it does not contain instances of poisoning or how a plant came to poison the victim. Attractive flowers or berries appeal to young people, who are tempted to eat them, but hundreds of the plants mentioned would not appeal to old or young in ordinary ways that would make them dangerous. A list of plants is given in an appendix as reputedly poisonous, and many of them are not above suspicion, but one would scarcely look for poison in Barberry, Wallflower, Borage, Hawthorn, Beech, Penny Royal, Virginian Poke, Goat's Beard, Broad Bean, etc. Chelidonium grandiflorum is given as a different species from C majus. The spelling of a number of the names would be better for revision, such as Peony, Abrus precatoribus, Crataegus oxyacanthes, and Gypsophilia.

INDOOR PLANTS.

IXORAS.

IXORAS are handsome stove flowering shrubs, and amongst the finest of all bush-flowering plants. Most of them are of compact, bushy habit, producing large trusses of flowers in varying shades of colour, which render them invaluable for all kinds of decorative purposes. When out of flower their dark green foliage is very attractive. Many of them may be grown as large specimens suitable for exhibition groups, and the cut blooms are of the greatest service for decorative purposes in vases, etc. The plants prove very serviceable when flowered in 48-sized or 32-sized pots for general decoration of the conservatory or dwelling house; they make a very bright display and last for some considerable time in flower.

The culture of the plants in small pots calls for close attention, yet extra labour in growing them to perfection is well repaid. Plants in large pots are not so well adapted for house decoration, and smaller specimens suffer less in dwelling rooms when in proportionately smaller pots with good, healthy roots. After flowering, Ixoras should be pruned back with the object of producing compact, bushy specimens for the following season. They should be grown on afterwards, and when growth is completed gradually hardened off in a dry atmosphere to favour the ripening of the wood during the autumn and winter. The plants should be started into growth in the spring in a genial, moist atmosphere and a temperature of 70° to 75° for summer blooming. Throughout the summer they may be grown in an ordinary plant-stove. During the winter a temperature about 60° is suitable.

All the species and varieties of Ixora will grow luxuriantly in a moist atmosphere, plunged in gentle bottom heat produced from fermenting material, such as dung and leaves mixed. The warm, moist conditions of the hot-bed act as a preventive to attacks of insects, such as red spider, scale, and mealy bug. Syringe the plants overhead two or three times during the day when the weather is suitable for spraying, and expose them fully to the light, but shade them from strong sunshine. An excess of water at the roots must be guarded against until the latter have filled the pots. When the plants are well rooted and commence to show their flower buds, a little liquid manure applied to the roots once or twice a week will be beneficial to them, as a stimulant favours the flower trusses opening freely, but liquid food should not be used before the flower buds are formed, otherwise it may start them into growth instead of flower.

On warm days a little air may be admitted, but draughts and a dry atmosphere must be guarded against.

Cuttings of half ripened wood root freely in sandy soil in a moist bottom heat and an atmospheric temperature of 70° to 75°, under a hand light or frame. If the cuttings are strong the plants will flower the first season in small pots. The soil for potting should consist of two-thirds rich, turfy loam and one-third fibrous peat or leaf-mould, with silver sand added. Well drain the pots with clean crocks or potsherds, and a little broken charcoal if the latter is procurable.

The following list includes some of the best and most generally cultivated Ixoras, and all may be highly recommended:—I. dixiana, a handsome form, of good constitution, flowers dark orange, produced in large corymbs—a fine exhibition plant; I. acuminata, flowers pure white and fragrant, a useful variety; I. Fraseri, a vigorous growing and most effective species, with salmon-coloured flowers tinged with carmine—an ideal exhibition variety; I. coccinea superba, a free-flowering, vigorous and healthy variety, the flowers bright orange scarlet; I. Pilgrimii, flowers bright orange scarlet, shaded with crimson, produced in perfectly round corymbs seven inches in diameter—a fine plant for exhibition purposes; I. Williamsii, a free-growing and profuse-flowering species, with reddish-salmon coloured flowers—unsurpassed for

Digitized by Google

exhibitions; I. Colei, pure white flowers, numerously produced; I. sanguinea, a distinct kind with numerous crimson flowers, shaded with deep violet; I. coccinea lutea, a pretty yellow with medium-sized flowers, very distinct; I. Prince of Orange, a free-flowering variety with bright orange-coloured flowers: a plant of strong habit of growth, making a large bushy specimen; I. Westii, a very pretty hybrid with flowers of a pale rose becoming bright rose with age, distinct from any other variety; I. macrothyrsa (syn. I. Duffii): this species has not a very compact habit of growth, but when grown with two to four strong, upright shoots it produces flower trusses of an enormous size of a beautiful scarlet tinged with crimson. Ixora macrothyrsa was first flowered in this country in 1878, when its extra large trusses of flower caused quite a sensation. It has foliage fully eight to ten inches in length. This species was discovered by Teysmann in the Celebes, and appears to be a somewhat widely distributed plant in the Malayan Archipelago. *John Heal, V.M.H.*

This spring the sparrows again attacked the Cerastium. To cover the whole plant mass with a raised netting, proof against these birds, was certain to produce an eyesore in the garden for two or more months. Was the plant really worth this? Two "nipper" mousetraps were baited, set, and laid on the Cerastium. Next morning I quite expected to find one or two sparrows caught; but, to my sorrow, a robin only was in one of the traps. This would not do, so the traps were unset but allowed to remain. They had the desired effect. Never a sparrow ventured on the Cerastium, which eventually gave its fine display of white, honey-scented bloom. This struck me as marvellous intelligence on the part of this bird, though it did not go so far as to distinguish between a set and unset trap.

Possibly the sight of the robin caught may have had something to do with the deterrent effect of the traps. It might, of course, be explained as a mere coincidence through the sparrows having just completed their nests, but the sequel will show that it was not so.

NURSERY NOTES.

A SWEET PEA NURSERY ON THE SOUTH-EAST COAST.

At this time of year when Sweet Peas are prominent in almost every garden and amongst the most attractive of the exhibits at flower shows, a few particulars of a Sweet Pea nursery which we visited last season about this date may be of interest to lovers of this most beautiful of all annual flowers. The nursery referred to is that of Mr. F. C. Woodcock, Walmer, Kent, a village that has great historic associations, the Castle at Walmer being for many years the residence of the famous Duke of Wellington, as well as of William Pitt.

Mr. Woodcock's nursery is situated on rising ground known as Drum Hill, at the top of which is Drum Inn, and the ground rises for several miles southward until it terminates in the highland about Dover Castle. The soil of the nursery is amongst the richest in Kent, being a deep loam overlying brick earth.

FIG. 16.—FIRST PRIZE BASKET OF CUT ROSES—MRS. CAMPBELL HALL—EXHIBITED BY MR. GEORGE PRINCE AT THE N.R.S. PROVINCIAL SHOW AT SALTAIRE. (SEE PAGE 46.)

SPARROWS AND CERASTIUM TOMENTOSUM.

THE perky and resourceful sparrow is ever inventing new ways of annoying the gardener. During the spring of last year I was perturbed by seeing the mass of Cerastium tomentosum taking on a dishevelled appearance, as if it had been much pulled about. Instead of recovering it grew worse, so a watch was kept and sparrows were discovered to be the cause. With their beaks they were observed to nip off the woolly shoots and to carry them away as material for their nests. A piece of netting was laid over, but this did not deter them. They did their best to drag off the netting to get at the Cerastium. As they had ruined the plants so far as flowering for the season was concerned, no further measures were then taken.

The sparrows had their nests high up in a Rose trellis close by, and on examining them it was found that the Cerastium had been used for the framework of the nest, along with dry grass stems, and not for the lining, which was composed of feathers, as usual.

After a time the traps were removed. On June 5 the sparrows were noticed attacking the Cerastium again, evidently preparing their nests for a second brood. The traps, unset and unbaited, were then put in position, and the birds ceased at once to trouble the plants. The traps after some days were removed a second time.

On July 1 this season's nests in the trellis were examined. Hardly any Cerastium had been used in their construction, but instead the old flowering stems of Alyssum saxatile, which was also growing in the vicinity. Of the five nests two had young ones fully fledged.

Three days afterwards the sparrows were observed to be attacking the Cerastium for the third time. The traps were again placed in position, and they immediately ceased their attentions. New nests in the preliminary stage of construction were seen in the trellis work, so evidently the birds were preparing for a third brood, confirmed by the fact that on an examination made on July 8 three nests were found with eggs. *J. P. Carlisle.*

Mr. Woodcock established the nursery in 1892, and soon began to specialise in Sweet Peas, cultivating at that time the best of the grandiflora type. His plants succeeded well, and he established a reputation for these flowers locally; in the early nineties he commenced the raising of novelties, in which he has been most successful. The first variety of note that he raised was Hilda, a very pretty orange-pink variety; but probably the most noteworthy of all Mr. Woodcock's seedlings is the one named Austin Frederick, of the lavender section, and he has since evolved a superior type of this variety named Austin Frederick Improved, a plant of very robust growth, and producing pale lavender flowers.

Others of Mr. Woodcock's novelties among Sweet Peas are Edna May, white; Cecily, pale salmon-pink with standards over two and a half inches in diameter; Mrs. Norman Lambert, a distinct, blood-red crimson variety, one of his latest seedlings; Salmon Queen, a popular exhibition variety; Lady French, rich orange-cerise, with rosy-carmine wings, in which nearly all the spikes carry four fine flowers:

Digitized by Google

Climax, a free, strong variety of rosy-carmine colour; Scarlet Queen; Invicta, of the shade known as vieux-rose; King George, a pale rosy-mauve variety, and Mrs. C. P. Tomlin, a sun proof scarlet variety.

Mr. Woodcock is a very clever cultivator of these beautiful flowers; most of the plants are trained to tall Bamboo stakes and disbudded, so that blooms of exhibition quality are produced. His practice is to sow the seed in October in 3-inch pots and plant out the seedlings in March 10 inches apart, allowing a distance of 12 inches for the stronger growers. The rows are set 5 feet apart. The ground is very rich, so that no animal manure is used, but fertility is increased by the use of a little basic slag and bone meal in the autumn, and a little sulphate of potash in the spring.

The collection of Sweet Peas includes most of the best sorts in cultivation, and at the time of our visit we saw such beautiful kinds as Mascotts Ingman, Geo. Shawyer, Giant Attraction, shell-pink; Burpee's Giant, a white which is close to Constance Hinton, and has similarly coloured seeds, but is probably a little superior; Hebe, R. F. Felton, Maroon King, of which the blooms were extra large; Royal Purple, Royal Scot, a fine Sweet Pea of scarlet-flame colour; King Mauve; Elegance, of which Mr. Woodcock has a fine strain; Mrs A. Hitchcock, somewhat after Cecily, but paler; Gloriosa, a fine scarlet variety; Colne Valley, pale lavender-blue; Matchless, cream; Sunset, with rosy-coloured wings and cherry-red standards, a delightful combination of colours; Rosabelle, Le Madhi, which as we saw it is a fine aniline-blue; Doris, cerise; Annie Ireland. Valentine, a robust grower with pretty blush coloured flowers; Mrs. T. Jones; and Sensation, which closely resembles Gloriosa.

Mr. Woodcock is still engaged in raising seedlings .and several we saw were of much promise, including one with very clear orange-coloured flowers, a distinct and promising novelty; and a mauve seedling, darker than King Mauve, and with a touch of blue at the base of the wings. Asked his opinion as to the best of the cream-coloured varieties, Mr. Woodcock placed Matchless first, followed by Majestic and Felton's Cream, and all these varieties were succeeding splendidly in his nursery. Those who are in the neighbourhood of Deal or Dover during the next few weeks should take the opportunity to visit this little known nursery, where Sweet Peas are grown to such perfection.

HARDY FRUIT GARDEN.

TRADITION AND FASHION IN APPLE CULTIVATION.

IN order to illustrate the object of this article, which in all probability will arouse some criticism, it is necessary at the outset to call attention to the types of Apple trees that are to be found in the majority of private gardens in the country. The first type of tree I will refer to is the familiar bush form with the lower branches almost to the ground, usually growing in a row with others of the same shape and character alongside the walk in the kitchen garden.

The growing of Apples in vegetable gardens originated in a past age, and it has become a tradition, a mere custom or fashion copied by one from another. The originators of the method were the school of gardeners who lived at the period I refer to, and they took it as the accepted and proper thing to do when they laid out a kitchen garden to surround practically all the vegetable quarters with fruit trees. It sounds almost like heresy to question the judgment of those old gardeners and say that it would have been infinitely better, both for the vegetables and the fruit, and also for the convenience of working, if the kitchen garden had been devoted from the outset to vegetables, and provision had been made for growing the fruit on a separate piece of land.

The typical Apple tree in these old gardens, irrespective of the variety or its habit, has been treated in the same orthodox way as regards pruning and management since the day it was planted. The tree has a thick stem now that it has advanced in years, and it is furnished with a certain number of main branches, which have been subjected to the process known as spur-pruning from the beginning.

Briefly, the process is this. In accordance with the orthodox and traditional procedure, which was supposed to be a fine art in fruit culture fifty years ago, all the young shoots along the branches were systematically cut back nearly to the base, without being quite as severe on the leading shoot. Very neat, symmetrical, and decidedly artificial does the tree look after its annual pruning, and when the growing time comes round it sends out another crop of shoots which in due course are cut off.

It is true that the process has been modified in some cases by summer pruning, and with more or less satisfactory results, whilst trees of vigorous growing habit which have grown out of hand have been checked by root-pruning.

There stands the spur-pruned tree to-day, with its gnarled and knotted branches and its thickly clustered spurs, confined to its restricted area so far as this has been possible in order to give the vegetables their share of room. The tree has carried many crops of leaves, the shoots cut from it have furnished material for many bundles of flower stakes and the tree has borne a lot of fruit in its lifetime, but nothing like the amount it would have done if it had been allowed to grow as nature intended it to do. Over and over again it has made a mute appeal for some of its young shoots to remain and produce fruit buds and bear, but that would have been against the traditions of spur-pruning and kitchen garden fruit culture, even though it would have saved a lot of labour in root-pruning.

The older commercial fruit grower adopted this method of fruit growing for a time, but he soon realised that it would land him in bankruptcy if he continued. He discovered that if he did less cutting he would increase the fruit-bearing area of the tree, which would make all the extension growth required each year. The result is that tradition and position still remain supreme in the matter of pruning in private gardens, but there is no room for it in the commercial plantation, which has to show a profit, and when the private gardener becomes a market grower he promptly changes his methods.

I very much doubt whether there is anything more unprofitable in private gardens to-day than the old espalier fruit trees, with their tiers of parallel branches, which are to be found in so many establishments, and, of course, always in the kitchen garden. It is true they are living monuments to the training skill of the old school of gardeners, but they had more time for this kind of work than gardeners have to-day, and the amount of fruit such trees produce does not justify the labour that is spent on them. After all, the growing of espalier trees is largely a tradition, a fashion, and a custom, and there is little to justify it when it is realised that the sole object of planting a tree is to produce fruit.

In many gardens, too, these ancient espaliers are such a tradition that the owner has much the same sentimental regard for them as he has for an old Mulberry or other tree with a history attached to it, and it would be unwise for any gardener to recommend their destruction. I have known a few of these old garden espaliers, however, that have been made fruitful and profitable through sheer force of circumstances, and it happens in this way. After years of close cropping the vigorous shoots along the top horizontal branches on either side of the central stem, instead of being cut off and turned into flower stakes, were left to grow, perhaps because there was no one to prune them, and in a short time more fruit was produced on this healthy young wood than over all the rest of the tree. Then the idea of maintaining the orthodox espalier shape was discarded, the useless lower branches at right-angles to the stem were cut off. The trees formed heads from the top branches and have become standards, but, what is all important, they bear heavy crops of fruit

On occasions when time permits I like to turn up an old gardening book, long since out of print and written by some noted practitioner of his day. Some of the rules laid down there are applicable to present-day conditions, but I am inclined to be amused at the rough wood-cuts illustrating methods of training fruit trees, and equally amused at the laboured and not easily understood directions for the training and pruning of the specimens. In the author's efforts to bend nature and incidentally the branches of fruit trees to his will he was thinking more about his geometrical design than the main functions of the tree, *i.e.*, to produce the maximum amount of fruit. *G. H. H.*

RED PLANT DISEASE IN STRAWBERRIES.

I NOTED with more than a little interest that Messrs. E. Ballad and G. S. Peren, of Long Ashton, now definitely regard eelworm as the cause of "Red Plant" (see p. 360, June 30, Vol. LXXIII.), and shall look forward to the publication of the promised article on the subject, and, more especially so, seeing that Mr. Peren has been a consistent opponent of the eelworm theory, first put forward by myself in April, 1920, and also seeing that as recently as September last (on the occasion of the annual meeting of the Horticultural Education Association at Long Ashton), Mr. Peren definitely stated that they were satisfied that eelworm was not the cause of "Red Plant" disease, and that it was more likely to be mosaic trouble. In your issue of May 29, 1920, you published a note from me with reference to this Tamar Valley disease, in which I considered eelworm to be the cause of the trouble.

During the course of a series of lectures to fruit growers in Cornwall, from 1920-1923, I definitely informed the growers that eelworm was the cause of the trouble; I also asked them to bring me suspected plants for miscroscopic examination, which they did, and in which parasitic eelworms were usually found.

Since April, 1920, I have examined some thousands of affected plants from different parts of Cornwall, with the same result, and I have repeatedly suggested to the various pathologists and inspectors of the Ministry of Agriculture and in various county and other reports that I was still of opinion that eelworm was the cause of the trouble.

On the occasion of the Bath and West of England Show at Plymouth, June 1 to 6, 1922, I had a chart prepared of the various eelworm troubles, giving "red plant" as one of these, and also had a series of affected plants to demonstrate to the growers, by means of the compound microscope, that parasitic eelworms were present. I may add that a species of Aphelencus was reported as having been found in specimens sent to Dr. Fryer at the Harpenden laboratory. *W. H. Johns, Superintendent, Gardens and Open Spaces, Bermondsey (late Horticultural Superintendent, Cornwall County Council).*

VEGETABLE GARDEN.

BROAD BEANS.

THESE are flowering well, and promise a good crop; they should therefore be well attended to as regards watering, hoeing, etc., and as soon as the plants reach a height of three feet or so, the points should be pinched out to encourage the pods to swell up well. Bean plants often become infested with black fly, especially in cold and dry weather, and should be dusted with tobacco powder or syringed with a suitable insecticide. If extra large pods are desired, thinning must be resorted to, leaving one pod at each joint, or even less crop than that. A last sowing may now be made on a warm border, placing one seed in each hole, about a foot apart, and giving the rows a good watering if the ground is dry. The Broad, or Windsor type of Bean is most suitable for late sowing. *T.*

HOME CORRESPONDENCE.

Double Buttercups.—No doubt botanists and many gardeners are interested in reading about double Buttercups; I much prefer single flowers, but as I have a weakness for "freaks," there may be found in this garden the double forms of Ranunculus acris, R. bulbosus, R. repens, R. speciosus, and R. Ficaria, the double R. speciosus being the best of the lot. I wish nurserymen would stock the single form of R. aconitifolius; it seems impossible to secure a good clump of it. Considering the millions of Buttercups one sees in the fields, it is remarkable how few variations in form and colour are found. I have a form of pale R. acris, and used to have a pale variety of R. bulbosus. *W. Butt, Hyde Lodge, Chalford.*

Cabbage Root Fly.—I have read Mr. A. H. Lee's article on the Cabbage Root Fly (p. 25), with some interest. If any reader is in difficulty owing to this pest, I advise him to try an experiment I made three years ago with great success. Mix red lead with water to the thickness of cream, and stir the roots of the young plants well into it before planting. I have planted Cauliflower so treated alongside Cabbage which was not so treated, and the result was an excellent lot of Cauliflowers with not a plant affected, while two-thirds of the Cabbage plants were infested. The red lead clings to the roots throughout the season, and so gives the fly no chance to penetrate to the roots. *W. D. Mackay, Balcombe Place Gardens, Sussex.*

SOCIETIES.

NATIONAL SWEET PEA.

JULY 11 AND 12.—Brilliant tropical weather favoured the holding of the National Sweet Pea Society's exhibition in the charming Sydney Gardens, Bath, on the above dates, in connection with the Bath and District Horticultural Society's show. The Sweet Peas were in wonderfully good form, despite the recent hot weather. Unfortunately, several members had to withdraw their entries as their flowers were spoiled by the terrific thunderstorm which broke over the metropolitan and other districts on Monday night, July 9. Not only were the flowers shown of excellent quality all through, but the colour was wonderful and the general arrangement of the exhibits left little to be desired. In most of the classes competition was keen.

There was a brief opening ceremony, presided over by the Mayor of Bath, Alderman C. Chivers, J.P., when Mdme. Sarah Grand (the Mayoress) opened the exhibition in a graceful speech, in which she referred to the beauty and value of Sweet Peas to-day as compared to the old days when these flowers were relegated to a small space in the kitchen garden. On behalf of the N.S.P.S. and the Bath Society, Mr. C. H. Curtis thanked Mdme. Sarah Grand and the Mayor for their presence.

After judging was completed the Mayor and Mayoress entertained the officers and the Committee of the N.S.P.S. and the local Society, and the judges, at luncheon. His Worship the Mayor proposed "The National Sweet Pea Society," to which Mr. Andrew Ireland responded; the "Bath and District Horticultural Society," proposed by Mr. J. S. Brunton, was responded to by Mr. T. Parrott, an old member of the local Society. Mr. H. C. Smith proposed, and Mr. Frank Cuthbertson—just home from California for a holiday—and Mr. T. Wilkinson responded to the toast of "The Judges." Mr. C. H. Curtis proposed "The City of Bath," to which the Mayor of Bath replied.

There was a great gathering of Sweet Pea specialists at Bath on this occasion, but Mr. Tom Jones, Mr. Stark and Mr. Holloway were notable absentees.

BATH AND EASTBOURNE CUP CLASSES.

These two classes are open only to members of the trade.

The Eastbourne Cup, presented by the County Borough of Eastbourne and offered for the first time in 1922, brought out a keen competition on this occasion. The award was made in favour of Messrs. IRELAND and HITCHCOCK, Marks Tey, who contributed a very fine display consisting of about a dozen large stands in which the varieties Mrs. A. Hitchcock, Royal Scot, Picture, Powerscourt, Shamrock, Mascotts Helio, Jean Ireland, Hawlmark Pink, Tangerine Improved, Matchless, and Elegance were the leading kinds. Low bowls of blooms were used between the larger stands; the flowers in this group were of very high quality.

The Bath Cup, presented by His Worship the Mayor of Bath, and offered for the first time for the best trade exhibit arranged on a space twelve feet by four feet six inches, was for flowers grown out-of-doors without any protection or shading. In this class also the competition was very keen, and the handsome cup was awarded to Mr. JOSEPH STEVENSON, Wimborne, who had flowers of fine quality and colour, and chiefly of varieties of his own raising. The central feature was three columnal stands of the beautiful variety Charming; Cynthia, Fair Lady, and Diana were other outstanding sorts.

All the trade exhibits in the Bath and Eastbourne Cup competitions were also judged for medal awards with the following result:—

Large Gold Medal.—To Messrs. IRELAND AND HITCHCOCK, Marks Tey; Mr. J. STEVENSON, Wimborne, and Messrs. DOBBIE AND CO., Edinburgh.

Gold Medal.—To Messrs. SUTTON AND SONS, Reading (two, one in each class); Messrs. ROBERT BOLTON AND SON, Halstead; and Messrs. E. W. KING AND CO., Coggeshall.

Silver-gilt Medal.—To Messrs. JAS. CARTER AND CO., Raynes Park.

Silver Medal.—To Mrs. P. WARNER ABBOTT, Hailsham; Mr. G. MORLEY, Preston Hall Training Colony, Aylesford; and Messrs. S. BIDE AND SONS, Farnham.

TRADE EXCLUDED CLASSES.

There were five competitors in the class for the *Daily Mail* Challenge Cup, and the chief award was made in favour of Sir RANDOLF BAKER, Bt. (gr. Mr. A. E. Usher), Ranston House, Blandford, Dorset, who had especially fine vases of Constance Hinton, Valentine, Picture, Hawlmark Pink, Royal Scot, and Matchless; second, F. W. FRANKS, Esq. (gr. Mr. W. Humphrey), Loampits, Tonbridge; third, Mrs. E. PALMER (gr. Mr. J. Dibben), Drayton House, Sherfield-on-Lodden, Hampshire.

In the Sutton Cup class, where eighteen vases

FIG. 17.—UNWIN CHALLENGE SHIELD, PRESENTED TO THE NATIONAL SWEET PEA SOCIETY BY MR. W. J. UNWIN, FOR COMPETITION AMONG SOCIETIES AFFILIATED TO THE N.S.P.S. (SEE PAGE 46.)

Digitized by Google

of distinct varieties had to be shown, Sir R. BAKER was again successful in competition with four other exhibitors, securing the premier award with fine flowers that included excellent vases of Matchless, Mascotts Ingman, Conquest, Elegance, Geo. Shawyer, and Mrs. T. Jones; second, Major G. LUBBOCK; third, Mrs. E. PALMER. The Cory Cup, offered for six varieties of Sweet Peas, to be selected from the Society's Classification List, was won by Mrs. V. N. WOOLMER, Warfield Priory, near Bracknell, who had particularly good examples of Doris, Picture and Austin Frederick; second, Mrs. E. R. WORKMAN, Gothic Lodge, Hayling Island; third, Dr. G. COLE, Beeston.

Sir RANDOLF BAKER was again successful in the class provided by Messrs. E. Webb and Sons, for nine vases of Sweet Peas distinct, and here his best varieties were Royal Purple, Hebe, and Mrs. H. Richards; second, F. W. FRANKS, Esq.; third, Mrs. E. PALMER. In the Stevenson class for a display of Sweet Peas put into commerce during or since the autumn of 1921, and in which a gold medal was attached to the cash first prize, there were, unfortunately, only two competitors, Sir R. BAKER and Lt.-Col. H. L. SCOTT, Hawthorn Lodge, Bracknell, who secured the first and second prizes respectively. First prize for three vases of Sweet Peas, to be selected from white, mauve, lavender, orange, pink, carmine or cerise varieties, was won by Sir R. BAKER with first-class flowers of Constance Hinton, Geo. Shawyer and King Mauve; second, O. H. ABBOTT, Esq., Lower Bourne, Surrey.

OPEN CLASSES.

The Monro Challenge Cup, for twelve vases of twenty sprays in not fewer than six varieties, raised and introduced by the exhibitor, was won by Mr. J. STEVENSON, who showed Cynthia, Charming, Grandeur, Diana, Liberty, Hebe, La France, and Lavender Bell, in fine condition; second, Messrs. T. CULLEN AND SONS, Witham; third, Mr. H. DAMERUM, Hayling Island.

A silver cup offered by the President of the Society, Mr. Robert Bolton, for the best twelve vases of Sweet Peas, distinct, was won by A. B. COSHAM, Esq., Ringwood Road, Eastbourne, with a capital exhibit in which the varieties Royal Scot, Hawlmark Pink, Constance Hinton, George Shawyer, Mrs. Hitchcock, and Giant Attraction were of outstanding excellence; second, Mr. J. STEVENSON; third, Miss RUSSELL (gr. Mr. C. H. Rundle), Barton Court, Canterbury.

Mr. J. STEVENSON was the most successful competitor in the class for three vases of seedling Sweet Peas not yet in commerce, winning with blooms of Charming, Grandeur and Felicity. In the succeeding class for one vase of a Sweet Pea not yet in commerce he was also the winner of the first prize with the variety Charming; second, Messrs. E. W. KING AND CO. No award was made in the class for the best blue Sweet Pea, and in the raiser's class for six varieties raised by the exhibitor the judges considered the three exhibits were of equal merit, consequently the prizes will be divided equally between Messrs. CULLEN AND SONS, Messrs. E. W. KING AND CO., and Mr. J. STEVENSON.

E. R. TUCK, Esq., Blandford, won the E. W. King cup for twelve distinct varieties offered for sale and catalogued during the autumn of 1922 or the spring of 1923, with an excellent set in which the principal varieties were R. F. Felton, Tangerine, Peace, Mrs. T. Jones, and H. Pitt; second, Miss RUSSELL.

On many previous occasions the Burpee Cup class for a display of waved Sweet Peas arranged on a space eight feet by three feet, and not to exceed four feet in height, has provided one of the most interesting contributions to the National Society's show. Unfortunately, on this occasion there was only one competitor, Messrs. E. W. KING AND CO., who secured the award with a well-arranged table of vases and bowls of Geo. Shawyer, May Cowdy, Hawlmark Pink, Gladys, Sensation, Dignity, Picture, and Royal Scot.

SINGLE BUNCH CLASSES.

Competition was very keen throughout the single bunch classes and first prize awards were made as follow: White, Sir R. BAKER, with Constance Hinton; pink, Miss RUSSELL, with Frilled Beauty; lavender or mauve, Mrs. PALMER, with R. F. Felton; cream, buff or ivory, Sir R. BAKER, with Matchless; orange or orange-scarlet, F. W. FRANKS, Esq., with Tangerine; this exhibitor also winning in the class for a cerise or cerise-scarlet variety with Wonderful; crimson or scarlet, Miss RUSSELL, with Charity; maroon, F. W. FRANKS, Esq., with The Sultan; picotee-edged, Mrs. E. PALMER, with Jean Ireland; blue, F. W. FRANKS, Esq., with Mrs. T. JONES; and "any other colour," Mrs. E. PALMER, with Royal Purple.

DISTRICT CLASSES.

In the Western Counties and South Wales Class the proprietors of the *Western Daily Press* offered a piece of plate as the first prize, and this was won by Sir R. BAKER, with six vases of very fine blooms, in which the varieties Jean Ireland, T. Stevenson, Valentine and Royal Purple were outstanding; second, Mrs. W. J. THORPE, Hucclecote, near Gloucester. In the Southern Counties class Mr. E. H. Christy's piece of plate was won by F. W. FRANKS, Esq., whose leading varieties were Constance Hinton, Gladys, Hebe, Daisy Bud, and Elegance; second, Mr. W. H. WALKER, Lewes. There was no entry in the Scottish class and one only in the Irish class, this being from W. BARRETT, Esq., Kilmory Road, Bray, who had particularly fine flowers of Daisy Bud, Jean Ireland, Doris, Hebe, and Powerscourt. No award was made in the Northern Counties class, but in the Midland Counties class S. HORTON, Esq., Chequers Road, Penn Fields, Wolverhampton, secured the first prize, and Mr. J. RANDALL, Leamington Spa, was second. The silver trophy offered by the Garden Supplies, Ltd., for the best exhibit in the District Classes was awarded to F. W. FRANKS, Esq.

OTHER CLASSES.

In the single-handed gardeners' classes, Mr. F. WHELER, Windy Ridge, Yarmouth, Isle of Wight, was the most successful exhibitor in the Bide class for nine vases of Sweet Peas, and Mr. F. STRATFORD, Hemel Hempstead, won the Breadmore Challenge plate for six vases, while Mr. W. USMAN won the silver medal offered for the best three vases of Sweet Peas distinct.

In other classes for small growers, Mr. F. J. CASHNELLA, Cardiff Place, Bath (one of the local secretaries), won the silver cup presented by R. B. Hamilton, Esq., for the best twelve bunches of Swet Peas distinct, and also the gold medal presented by the Society. He showed very fine blooms of Constance Hinton, Hilda, Doris, Picture, and Austin Frederick. Mr. J. RANDALL won the Hawlmark Cup offered by Messrs. A. Dickson and Sons for six vases of Sweet Peas distinct, and Mr. W. J. ABREY, Hadlow Road, Tonbridge, had the best three vases of Sweet Peas, while Mr. L. M. GUTTRIDGE won the *Amateur Gardening* Cup for nine vases of Sweet Peas. Mr. T. J. ROGERS, St. Hilda, Yarmouth, Isle of Wight, won the Small Growers' Cup presented by Mr. E. H. Christy and offered for the best exhibit of twelve vases of Sweet Peas distinct. Mr. J. RANDALL won the Walter Voss Challenge Cup for six varieties, and Mr. L. E. SIMS, of Eastbourne, and Mr. F. J. ROGERS were successful in other classes.

AFFILIATED SOCIETIES CLASS.

For the purpose of encouraging competition among the numerous Societies affiliated with the National Sweet Pea Society, Mr. W. J. UNWIN, of Histon, Cambridge, very generously presented a large and handsome shield (Fig. 17, p. 45) as a prize in a class for twelve vases of Sweet Peas, the flowers to be grown by members of the competing Society. This was the first occasion on which it was competed for, and the Eastbourne Horticultural Society secured the coveted award with a capital collection, which included excellent blooms of Mrs. T. Jones, Elegance, Renown and Geo. Shawyer; second, the Wincheap Allotment Association; third, the Breasted and Thurnham Horticultural Society.

FLORAL DECORATIONS.

Three classes were provided in this section, open only to lady members of the Society, and in each case the competition was particularly keen. Mrs. A. R. BIDE, of Farnham, won the piece of plate offered by Mr. J. S. Brunton for the best decoration of Sweet Peas for the dinner table, with a very dainty exhibit of pale cream and orange-salmon coloured flowers, arranged in low, brown, wicker baskets; second, Mrs. RUFF, of Sharnbrook, with a very bold design of scarlet and cream coloured flowers arranged in low, gilt baskets; third, Mrs. COLSTON HALE, with pink and rose-coloured flowers. Mrs. RUFF led in the class for a basket or other suitable stand of Sweet Peas and secured the piece of plate offered by Mr. C. H. Curtis, with a pleasing arrangement of white and blush-coloured flowers; second, Mrs. B. Peyman, St. Enodoc, Wellington College, Berkshire. Miss G. BURT was awarded a piece of plate offered by Mrs. A. Hitchcock for the best bowl of Sweet Peas to include only three varieties, and she arranged a very charming exhibit of cream, salmon and pale mauve flowers; second, Mrs. CHAMPION, Grove Park, Weston-super-mare; third, Mrs. A. R. BIDE.

NATIONAL ROSE (PROVINCIAL SHOW).

THE provincial show of the National Rose Society was held in the Roberts' Park, Saltaire, on July 10 and 11. Heavy rains, accompanied by thunder, were experienced in the early morning of the first day of the show, but as most of the blooms had been cut previously they were in fine condition. As the day advanced the weather brightened up, and in the afternoon the heat was intense. In quality and quantity the Roses showed a vast improvement upon those at the show held at Regent's Park, and, on the whole, the display was quite equal to that usually seen in the provinces.

There were numerous seedlings submitted for award, but none was of exceptional merit. The members of the New Seedling Rose Committee of the N.R.S. do not seem to attend well at provincial shows. On this occasion only two were present, and we think this a matter which requires attention from the Council of the Society. Some of the best seedlings are often staged at a provincial show, and it is important that a majority of the Committee should attend to make the awards.

TRADE CLASSES.

In the class for 36 blooms, distinct novelties, first prize and the Jubilee Trophy were awarded to Messrs. D. PRIOR AND SON, LTD., Colchester, for an even lot in which George Dickson, E. G. Brown, Louise Crette and Lady Ashtown were prominent flowers; 2nd, Messrs. FRANK CANT AND CO., for a set but little inferior to the first. Notable varieties in this set were Mrs. Hugh Dickson, Mrs. Foley Hobbs, Mildred Grant and Gorgeous; 3rd, Mr. W. BLINGEN, Newcastle, Co. Down; 4th to Mr. HUGH DICKSON, Belfast. Messrs. D. PRIOR AND SON also excelled in the class for 24 blooms, distinct varieties. They had George Dickson, Modesty, Augustus Hartman and Dean Hole in grand condition; 2nd, Mr. GEORGE PRINCE, for a fine lot in which we observed magnificent blooms of Florence Forrester, Mrs. George Norwood, and Mrs. H. R. Darlington; 3rd, Mr. G. BURCH, Peterborough.

For 12 blooms of new roses, distributed since January 1, 1919, distinct varieties, the premier award was easily won by Mr. GEORGE PRINCE with a splendid set; the twelve blooms were Lady Inchiquin—in glorious colour—Capt. Kilbee Stuart, Mrs. H. R. Darlington, Muriel Wilson, Mabel Morse, Manifesto, Courtney Page, Bessie Chaplin, Mrs. C. Lamplough, J. G. Glassford, Diadem, and Capt. Bold; 2nd, Messrs. D. PRIOR AND SON; 3rd, Mr. E. J. HICKS; 4th, Mr. H. DICKSON.

For a basket of cut Roses, one variety, the leading position was occupied by Mr. GEORGE PRINCE, with a massive lot of Mrs. Campbell Hall (Fig. 16, p. 43); 2nd, Mr. E. J. HICKS, with Mrs. E. J. Hicks; and 3rd to Mr. GEO. BURCH. In the class for three baskets of cut roses,

Digitized by Google

three distinct varieties, 36 stems of each variety, Messrs. BEES, LTD., Chester, won first prize with Venus, Adonis and Sybil, three varieties of their own raising; 2nd, Mr. E. J. HICKS; 3rd, Mr. HUGH DICKSON.

For 24 distinct varieties, not less than three nor more than seven stems of each, exhibited on a space not to exceed 14 ft. by 3 ft., Mr. JOHN MATTOCK, Oxford, was first, and Messrs. F. CANT AND CO. second. For 12 varieties, arranged on a space not to exceed 5 ft. by 3 ft., Mr. ELISHA J. HICKS was placed first, Messrs. CHAPLIN BROS., Waltham Cross, 2nd, and Mr. G. BURCH 3rd.

For a basket of cut Roses, one variety, not yet in commerce, 36 blooms, Mr. H. DICKSON, Belfast, led; Messrs. ALEX. DICKSON AND SONS 2nd, with a fine set of their new Shot Silk; Messrs. BEES, LTD., 3rd, with Joan Howarth.

In the classes for growers there was a good display, and the staging was of a high order of merit. For a representative group of cut Roses to occupy a space not exceeding 30 ft. by 4 ft., Messrs. ALEX. DICKSON AND SONS, Newtownards, were easy winners with a fresh lot of flowers superbly set up. They had gloriously coloured flowers of Lady Inchiquin and Betty Uprichard; Messrs. ALLAN AND SON, Norwich, 2nd. For a representative collection staged on a space not more than 15 ft. by 4 ft., Mr. GEO. PRINCE was first prize winner, followed by Messrs. CHAPLIN BROS., LTD., Mr. E. J. HICKS, and Messrs. MCGREDY AND SONS, Portadown, in the order named.

AMATEURS' CLASSES.

In the amateurs' classes there was not much competition. Mrs. BALFOUR was the leading prize winner in the classes for 24 and 12 blooms of distinct varieties, and the second prize in both classes went to Mr. W. SUNDERLAND. Mrs. BALFOUR also excelled in the class for nine blooms and for a basket of cut Roses. Other leading prize winners in the amateurs' section were Mr. G. MARRIOTT, Mr. W. SLINGER, and Mr. F. A. GEORGE. Mrs. COURTNEY PAGE, Enfield, was awarded first prize for a decorated dinner-table, a bowl of cut Roses and a vase of cut Roses.

NEW ROSES.

GOLD MEDALS.

Allen Chandler.—Exhibited by Mr. GEORGE PRINCE, this is a large, semi-double, pillar variety, with rosy-crimson flowers. It is apparently a free bloomer and will make an attractive variety when grown as a large bush or on a pillar. It is delightfully fragrant.

Fred J. Harrison (Fig. 14, p. 39).—A finely formed flower of a bright shade of crimson. It is powerfully scented and is one of the few new crimson Roses to carry fragrance. Shown by Messrs. ALEX. DICKSON AND SONS.

CERTIFICATES OF MERIT.

Betty Hulton.—This variety, and also *Maude Cuming*, were shown at Regent's Park, and have already been described. They are fine Roses, with a character above most of the average seedlings, and they will, no doubt, be shown again in the autumn. Betty Hulton is a fine yellow. Shown by Messrs. ALEX. DICKSON AND SONS.

Joan Howarth.—A flower of the Ophelia type, but a trifle larger and a little deeper in colour. A very attractive variety. Shown by Messrs. BEES, LTD.

Fragrance.—A Rose of rich perfume, and on this account it received a Certificate of Merit. The colour is a vermilion-crimson, but the flowers are not shapely. Shown by Messrs. CHAPLIN BROTHERS.

OTHER SEEDLING ROSES.

Lady Charmion.—A small, but shapely, flower, somewhat after the Geo. C. Wand shade of colour. Hypatia.—A small decorative variety with flowers of an orange tint flushed with crimson. It is of the Old Gold and Lamia type. Marion Horton.—A flower of medium size and of a shade of buff-white deepening in colour at the centre. It is not an attractive colour. Firefly.—A small crimson-scarlet decorative Rose, which is pretty in the bud stage, but appears to be very flat when open.

The above four seedlings were shown by Messrs. BEES, LTD.

The Beacon.—This Wichuraiana Rose of a similar character to Hiawatha, is a single crimson, with a small white eye, and in colour is not by any means brilliant. Innocence.—A single, or rather semi-single Rose, which has been staged before. It does not seem to be any improvement upon Simplicity. F. I. Looymans.—A large Rose, with yellow flowers, shading off to white. As shown it is not nearly so good as Hortulanus Fiet, which it resembles very much. Etna.—A semi-double, crimson-scarlet, which is not required when we have such Roses as K. of K.

These three varieties were shown by Messrs. D. PRIOR AND SONS, LTD., Colchester.

Messrs. ALEX. DICKSON AND SONS showed the following varieties: Gwynne Carr—a flower with a clear shell-pink centre fading off to the edges. A pretty rose, but not sufficiently distinct. George H. Mackereth.—A rosy-crimson coloured flower, which unfortunately fades off, as shown, to a blue tone. Evelyn Murland.—A Rose of Betty Uprichard character, but we do not consider it to be so good. Scrabo.—A little, double, decorative Rose, of a brilliant hue. The colour is a rich crimson-scarlet. Annie Ireland.—A large flower, fit for the exhibition table. The blooms are finely pointed. It may be described as somewhat after the style of Florence Pemberton. Shot Silk was fully described in our report of the Regent's Park Show. It was awarded a certificate there, but failed to gain the premier award here. Richard E. West.—A large, well-shaped flower, of the Mrs. Rindge type. The colour is a pale yellow. This is a very promising variety, which will most likely be heard of again.

Little Joe, which was awarded a certificate at Regent's Park, by Messrs. D. PRIOR AND SON, was again exhibited for the higher award. The flowers were not in condition, and were not so good in colour as when first shown. The colour is a scarlet-crimson. The flowers are single or nearly so, and are fairly small.

Reg. Chaplin.—A small-flowered variety, with crimson-scarlet flowers, flushed with maroon. Ellen Terry.—A Rose with a buff centre, shading off to white at the edges of the petals. The blooms are small.

The two foregoing varieties were shown by Messrs. CHAPLIN BROS.

Mrs. I. I. Hudson.—This was shown by Mr. GEO. LILLEY, and is a flower of exhibition standard of the William Shean type. The colour is a rich rosy-pink.

Messrs. MCGREDY AND SON, Portadown, staged numerous seedlings, but the flowers appeared to be suffering from the late season, and were nearly all small and poorly developed. The most notable were Ivy McKee, which resembled a small Gorgeous, when that variety is at its best, in colour. The colour of this Rose was good, but the flowers were only miniatures. Jane Boyd.—A small-flowered Rose. The centre petals are a rich cerise, and the outer ones are flushed with yellow. This is a very shapely variety, and very showy, but the flowers, as seen, are far too small. Harriet Easlea was shown at the provincial show at Wolverhampton, last year. It reminds one of a more shapely and refined The Queen Alexandra, with a better tone of colour. The flowers, however, are too small. Gwyne Jones is a brilliant coral red flower. Vesuvius, which was also shown at Regent's Park, where it gained a certificate, is a single crimson-scarlet.

SALTAIRE AND DISTRICT ROSE.

THE seventeenth annual show of the Saltaire and Shipley and District Rose Society was held in conjunction with the N.R.S. Provincial Rose Show. There were good exhibits of Pansies and Violas, Roses, Sweet Peas, and Carnations. Hardy Herbaceous plants were also shown extensively.

In the Sweet Pea classes Sir R. BAKER, Blandford, was the principal prize-winner. Mr. C. ENGELMANN was supreme for perpetual flowering Carnations, followed by Mr. C. TAUDEVIN, Willaston. For hardy perennials, the leading prizes went to Messrs. G. LONGSTER AND SONS, of Malton, and Messrs. G. GIBSON AND CO., Bedale.

NON-COMPETITIVE EXHIBITS

Large Gold Medals.—To Mr. P. GARDNER, Ilkley; Messrs. BACKHOUSE AND SON, York; Messrs. J. PEED AND SONS, West Norwood; Messrs. MANSELL AND HATCHER, Rawdon; and Messrs. SUTTON AND SONS, Reading.

Small Gold Medals.—To LAKELAND NURSERIES, Windermere; Mr. T. M. PETCH, Horton; Messrs. CONWAYS, LTD., Halifax; Mr. C. ENGELMANN Saffron Walden; and THE DONARD NURSERIES, Co. Down.

BURY ST. EDMUNDS.

THE exhibition of the Bury St. Edmunds and West Suffolk Horticultural Society was held in the Corn Exchange, Bury, on Thursday, the 12th inst., and it must be said that the heat and protracted drought which have been experienced in the district for several weeks militated considerably against a full display. The hall is admirably suited for a flower show, as it is lofty and splendidly lighted, while the ventilation is so excellent that despite roundabout 90 degrees shade temperature outside, there was a reasonable degree of comfort inside.

There were two entries in the open-to-all class for 24 Roses distinct, and premier position was accorded to Messrs. D. PRIOR AND SONS for a bright, fresh set comprising some really fine specimens; Messrs. FRANK CANT AND CO. had to be content with the second prize, though it is more than likely that certain other judges would have put them several points in front of their opponents. Precisely the same thing happened in the class for 12 Roses, but since both growers knew before the judging the respective merits of the exhibits, the winner condoled with the loser on his bad fortune, while the loser congratulated the winner on his good fortune. Would that all similar happenings could have as happy endings!

A very attractive semi-circular group of flowering and foliage plants gained the first prize for Sir GEORGE AGNEW, Bart, Rougham, Bury St. Edmunds (gardener, Mr. J. Noble); carnations were the finest feature of this display. Sir PIERCE LACY won for six vases of hardy herbaceous flowers and Mrs. White for six vases of annuals, the set containing Antirrhinums of obviously last season's raising and therefore scarcely eligible for the class. Mr. A. D. LUSHER showed some really good bunches in the class for 12 varieties of Sweet Peas; Constance Hinton, Royal Scot, R. F. Felton, Picture and Tangerine were most noticeable. In Mr. F. WORBY'S winning set of six varieties Elegance, Royal Scot and R. F. Felton were the best vases.

Plants, cut flowers and decorative exhibits were attractively shown. The outstanding non-competitive exhibit came from SIR GEORGE AGNEW, and comprised well grown greenhouse plants in considerable variety.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE July meeting of this Society was held in the R.H.S. Hall on the 9th inst., Mr. T. R. Butler presiding. Five new members were elected. Five members withdrew double the amount of their interest from their deposit accounts, amounting to £19 7s. 6d. Three members over the age of 70 years withdrew sums from their deposit accounts amounting to £90 5s., and the sum of £14 9s. 5d. was passed for payment to the nominee of one deceased member.

The sick pay for the month on the private side amounted to £75 12s. 1d., and on the

Digitized by Google

State side to £70 18s. 6d.; maternity benefits were £12. Grants for dental treatment were made to six members, amounting in all to £24 8s., and other cases were considered

WOLVERHAMPTON.

JULY 10, 11 AND 12.—Considered as a flower show only, the exhibition held on the above dates in West Park was one of the finest ever held at Wolverhampton during the past thirty-one years. The exhibits of fruit and vegetables were few in number, and their quality, though good, was below that expected at a great show in a normal season. The flowers and plants, however, atoned for any deficiency in other sections, and were unusually attractive. The group classes were well filled with fine displays of the art of arrangement, coupled with cultural skill, and in themselves constituted a show of no mean proportions. The hardy flower exhibits were also first-rate, if we except a tendency to crowding on the part of the exhibitors in the chief class, but the quality of the flowers staged in this and other classes was very high. Some excellent Sweet Peas were forthcoming, while Roses were so finely shown and displayed that they provided one of the chief attractions of a great show. The table decorations were good. It was regrettable that there were no exhibits in the classes for Carnations and for Delphiniums.

Not only are the traders and large growers catered for at Wolverhampton, but numerous classes are provided for amateurs, for allotment holders and cottage gardeners, and also for school children, and in all these sections there were capital displays, which afforded ample evidence of the interest the continuation of these classes has created.

Altogether, the Wolverhampton officials have every reason to congratulate themselves upon the success attending their efforts in an unkindly season. During the morning of the first day the weather was sultry and overcast and just after lunch-time rain fell for a short period.

GROUPS.

There was a grand display in the important class for a group of miscellaneous plants arranged for effect, where the total cash prizes offered amounted to £100. Premier award was won by Sir G. KENRICK (gr. Mr. J. Macdonald), Birmingham, who had a very pleasing exhibit arranged on a space 25 ft. by 12 ft. He produced an elegant and bright exhibit by the use of arching spikes of Odontoglossums, Cymbidiums, Miltonias and Oncidiums. Francoa ramosa. Ixoras, Cattleyas, Saxifragas, Begonias, and orange-red Fuchsias were other flowering plants used effectively, with small Caladiums, Rex Begonias, Nandina domestica, Alocasias, Dracaenas, Ferns, Fittonia and other foliage plants. Sir G. KENRICK is a steady and persistent exhibitor and was heartily congratulated upon winning the premier award from such notable exhibitors as Messrs. J. CYPHER AND SONS, who obtained second place and arranged a beautiful display in which highly coloured Codiaeums, Cattleyas, Laelio-Cattleyas, Liliums and Cypripediums were used with great taste. Mr. W. A. HOLMES, Chesterfield, 2nd; and Mr. R. MANNING, Dudley, 3rd, each showing groups which would have won first prizes at many prominent shows.

In the class for a group of ornamental foliage plants, but in which flowers and flowering plants were not admitted, Messrs. J. CYPHER AND SONS won the principal award with a very pleasing arrangement of Palms, Codiaeums, Rex Begonias, Nandina domestica, Aralias, Anthuriums and bold Alocasias, with a setting of useful Ferns. This exhibit was arranged on a space of two hundred square feet by the side of one of the principal tents. Sir G. KENRICK was second; Mr. W. HOLMES third, and Mr. MANNING fourth.

Competition was not so keen in the smaller class for a group of one particular kind of flowering plant, but Messrs. J. CYPHER AND SONS made an interesting display of Clerodendron fallax, winning therewith the first prize; 2nd, Sir G. KENRICK, with a pleasing exhibit of Clarkias. The best group of bedding plants was the one arranged by Mr. A. S. DUNTON, Penn, who associated various sections of Pelargonium in a very attractive manner. The class for fifteen specimen plants in pots not exceeding ten inches in diameter, at least eight to be in bloom, was not wholly a success as compared with exhibits in a similar class in pre-war times. Messrs. J. CYPHER AND SONS gained the first prize with well-grown examples of Ixoras, Codiaeums, Clerodendron Balfouri, Statice and Anthurium Andreanum; 2nd, Mr. MANNING.

In a section confined to gentlemen's gardeners and amateurs, premier award for a group arranged on a space not exceeding one hundred and fifty square feet was won by G. MANN, Esq. (gr. Mr. G. E. Clark), Penn, with a pyramidal display of Pelargoniums and other greenhouse plants; 2nd, W. F. H. REEVES, Esq. (gr. Mr. W. A. Deans), Wolverhampton.

ROSES.

Roses were particularly well shown at Wolverhampton, and it constituted one of the brightest and most attractive features of the large exhibition. For thirty-six blooms of distinct varieties Messrs. JARMAN AND CO. led with capital blooms of Gorgeous, Mildred Grant, Mrs. Foley Hobbs, Florence Forrester, M. E. West and W. Brunner; 2nd Mr. W. DREW; 3rd, Mr. C. GREGORY. Mr. J. MATTOCK, New Headington, led in the class for five baskets of cut Roses with beautiful blooms of Souvenir de Mrs. F. Boley, Mrs. H. Morse, and Margaret Dickson Hamill; 2nd, Mr. C. GREGORY, who also staged a grand lot of flowers; 3rd, Messrs. ENGLISH AND SON. Mr. J. MATTOCK was also the most successful exhibitor of one basket of dark-hued Roses, and Mr. C. GREGORY 2nd. In the class for one basket of light Roses, Mr. DREW excelled with a fine set of Nellie Parker; 2nd, Mr. C. GREGORY. Messrs. JARMAN AND CO. won first prize for a dozen blooms of Tea Roses with brightly coloured flowers of popular varieties; 2nd, Mr. DREW.

In the interesting class for eighteen distinct varieties of any perpetual-flowering Rose Mr. H. DREW showed a lovely set, in which the varieties William Shean, Mrs. C. Russell, and Mrs. H. Morse were conspicuously good; 2nd, Mr. C. GREGORY, Chilwell.

The displays of cut Roses were extraordinarily good, and in the class for an exhibit of cut blooms arranged for effect on a space twenty feet by four feet, Mr. J. MATTOCK won in a close competition. He had a pleasing arrangement of columns and stands of various sizes filled with charming flowers of Golden Emblem, Ophelia, Mrs. C. V. Howarth, Mrs. H. Morse, Trier, Isobel, and Los Angeles. The edging of this display was composed of small sprays of Polyantha and single Roses. Messrs. ENGLISH AND SON, Barnwood, Gloucester, 2nd, with a very fine bank of bloom; 3rd, Messrs. W. LOW AND SON, Beeston. In a somewhat similar class, but for a group arranged on a space ten feet by four feet, Messrs. H. BECKETT AND BARNES, St. Leonards, were placed first for a lovely arrangement of cream, pale yellow and pink Roses, associated with plenty of clean Rose foliage and with a festooning of sprays of Wichuraiana foliage in front; 2nd, THE BURBAGE NURSERIES, Hinckley.

FLORAL DESIGNS.

Competition was scarcely so keen in this section as we have seen it previously, except in the dinner-table classes.

Mr. C. J. VICKERS was the leading prize winner, winning the premier awards for a hand bouquet with a design in Odontiodas and mauve Cattleyas; for a bridal bouquet and two bridesmaids' bouquets, the first composed of white Orchids and the two latter of yellow Carnations; and for a feather-weight bouquet, with a pleasing arrangement of Odontiodas and Cattleya Mossiae Reineckiana.

In the principal class for a dinner-table decoration the leading award was made in favour of Sir G. KENRICK, who had a dainty design composed of Gloriosa flowers, Miltonias, one or two sprays of white Phalaenopsis, white Streptocarpus, and Epidendrum vitellinum majus; 2nd, Mr. W. G. GRIERSON (gr. Mr. T. Parry), Severn Stoke, who associated small sprays of golden Calceolaria with Francoa ramosa, Gloriosa blooms, and Oncidium sprays; 3rd, Mr. C. J. VICKERS, Leicester, who used Odontoglossums and Odontiodas, but had a slightly heavy arrangement.

A class was provided for a decorative display of plants and flowers arranged on a space six feet by four feet, and in this Messrs. J. CYPHER AND SONS were easily first, with bright Codiaeums, a few elegant Palms, Odontoglossums, Liliums and Kalanchoe; 2nd, Mr. MANNING; 3rd, Mr. HOLMES.

SWEET PEAS.

The chief award for eighteen varieties of Sweet Peas to be arranged in eighteen bridesmaid's or gypsy baskets or in vases, one variety in each receptable, was won by Mr. F. R. MINSHULL, Market Drayton, who had splendid flowers arranged in the orthodox vases, and his examples of Matchless, Conquest, Jean Ireland, Elegance and Mrs. Arnold Hitchcock were of outstanding merit; 2nd, Mr. A. S. DUNTON, who used baskets entirely, and made a very pleasing display; 3rd, Mr. H. SAMUEL, who used both baskets and stands.

The first prize for twelve vases of Sweet Peas distinct was won by Mr. A. S. DUNTON, who showed Austin Frederick, Elegance, Charity, and Hercules in fine condition; 2nd, Mr. A. MARSH, Warwick; 3rd, Major HARCOURT WEBB (gr. Mr. Gaiger), Bewdley. In the class provided by Messrs. E. Webb and Sons for six bunches of Sweet Peas Mr. T. MARKILL, Dudley, won the first prize and Mr. A. H. HICKMAN, Cookley the second.

Some of the very best Sweet Peas in the show were to be found in the amateurs' section, where Mr. P. MADELEY, Market Drayton, won first prize for twelve varieties, with unusually fine examples of Matchless, Jean Ireland, Mrs. A. Hitchcock, Constance Hinton, Austin Frederick, Hebe, Charity, Royal Scot, and Elegance.

HARDY FLOWERS.

One of the finest displays in the whole exhibition was made by the exhibits of hardy border flowers arranged on a ground space twenty-five feet by seven feet. In the matter of quality of flowers, Messrs. HARKNESS AND SON took the lead and deservedly won first prize, but their somewhat crowded arrangement left a good deal to be desired in so far as a display of border flowers is concerned. This firm was exceptionally strong with Delphiniums, Verbascums, Astilbes, Poppies and Gallardia The King. Messrs. GIBSON AND CO. had, we consider, the best arrangement of flowers, but lacked something with regard to quality. Their leading subjects were Delphiniums, Campanulas, Verbascums, Kniphofias and Oriental and Iceland Poppies; 3rd, Messrs. M. PRICHARD, Christchurch, who had a very beautiful set of Astilbes in their exhibit.

Two capital exhibits were set up in the class for a collection of Lupins, and Messrs. HARKNESS AND SON, Bedale, won first prize with flowers showing beautiful shades of pink, pale yellow and terra-cotta; 2nd, Messrs. GIBSON AND CO., with varieties in blue or purple shades of colour. Mr. A. S. DUNTON excelled in the class for a collection of Antirrhinums and showed some remarkably good spikes, especially of yellow varieties; 2nd, THE CHALKHILL NURSERY, Reading, who had a very stiff arrangement; indeed, all the exhibits in this class might have been greatly improved in the matter of their presentation.

VEGETABLES.

No doubt the severe weather conditions experienced this year were responsible for the lack of keenness in the vegetable section. Mr. W. GRESSON led in the class for eight distinct kinds of vegetables, and showed capital Cauli-

Digitized by Google

flowers, Celery, Onions, Peas and Tomatos: 2nd Mr. A. H. HICKMAN. In a class for six distinct kinds Mr. GRESSON again excelled, showing Carrots, Cauliflowers, Onions, Marrows and Tomatos in good form; 2nd, Mr. A. H. HICKMAN; 3rd, Mr. H. WATSON SMITH, Stourbridge.

Messrs. Sutton and Sons' first prize for six distinct kinds of vegetables was also won by Mr. GRESSON, who was by far the most successful exhibitor in this section.

TRADE EXHIBITS.

The trade displays were numerous and extensive and added greatly to the beauty and interest of the show. The following are the principal awards made to traders :-

Challenge Cup.—This cup, offered for the best exhibit in the show, was won by Messrs. BAKERS, Wolverhampton, with a very fine contribution consisting of a formal garden, rock garden, hardy flowers and a "model" garden.

Large Gold Medal.—To Messrs. BAKERS, Wolverhampton; and to Messrs. E. WEBB AND SONS, Stourbridge, for a fine display of flowers, fruits and vegetables.

Gold Medal.—To Messrs. FORBES AND SON, Hawick, for Pentstemons and Phloxes; to Messrs JARMAN AND CO., for Sweet Sultans and Roses; to Mr. H. ELLISON, West Bromwich, for Ferns and Cacti; to Messrs. J. KING AND SONS, Coggeshall, for Sweet Peas, etc.: to Mr W. WELLS, Merstham, for hardy flowers; and to Messrs. HEWITT, Birmingham, for plants, flowers and designs.

Silver Medal.—To Messrs. MAXWELL AND BEALE, for alpines.

NATIONAL CARNATION AND PICOTEE.

THE National Carnation and Picotee Society held their annual exhibition in conjunction with the meeting of the Royal Horticultural Society on July 10.

The first prize for six vases of Carnations distinct was won by Mr. JAMES DOUGLAS, Great Bookham, Surrey. His blooms of Grenadier, Sunshine and Hy. Brett were fine. Messrs. LOWE AND GIBSON, Crawley Down, Sussex, were a good second with Fireman, Mary Murray, etc.

Mr. JAMES DOUGLAS also excelled in the class for six fancy yellow ground Carnations. A First-Class Certificate was awarded to the variety Waverley Honour in this class.

Mr. J. DOUGLAS was awarded the first prize for six fancy, white-ground Carnations; he also led in the class for six selfs.

Miss SHIFFNER was a successful competitor: she won first prizes for (a) three white ground fancy Carnations, (b) six selfs, (c) one white, (d) one yellow, (e) one orange, (f) one scarlet, (g) one crimson, (h) one rose, and (i) one heliotrope variety, three flowers of each.

Mr. H. A. KNAPTON, Orpington, was awarded first prizes for two vases of selfs, two fancy yellow grounds, and for three varieties in a vase. Mr. H. A. KNAPTON was also successful in the classes for three white-ground fancy Carnations, three yellow-ground Picotees and three selfs.

Mr. J. DOUGLAS was awarded a First-Class Certificate for Carnation King of Cloves (deep crimson): a similar honour for the fancy scarlet and heliotrope variety named James Griggs; and for a white self named White Fox.

Messrs. LOWE AND GIBSON were accorded a First Class Certificate for a fancy yellow ground Carnation named Enid Lowe. The flower is striped with heliotrope.

Mr. JAMES DOUGLAS secured the leading awards in the classes for (a) a yellow-ground fancy Carnation, (b) a heliotrope one, (c) a yellow-ground Picotee, and for (d) scarlet, (e) crimson, (f) yellow, (g) pink and (h) maroon selfs in vases.

Mr. JAMES DOUGLASS had a very fine non-competitive group of border Carnations.

Miss SHIFFNER had the premier white self in White Fox.

REDRUTH EXHIBITION.

JULY 4-5.—The annual show of this Society was held on these dates. The horticultural section was again a great success. For many years this show was well known for the excellence of the exhibits of stove and greenhouse plants. This year these subjects were represented by a single entry in each of five classes. The exhibitor was Mrs. LANYON, Tolvean, Redruth (gr., Mr. Harry Williams), who showed Anthuriums, Clerodendrons, Haemanthus, Richardias, Rondeletias, Gloriosas, Phyllanthus, Caladiums, etc., and a group of Orchids.

Messrs. ROBERT VEITCH AND SON, Exeter, showed a large group of hardy perennials (including Romneya Coulteri, Delphiniums in great variety, Lilium auratum, L. regale, Gaillardia Fire King, Sweet Peas, Roses, Alpines, Bamboos, etc.

Messrs. WATTS, Rosevale, Penzance, showed a handsome exhibit of Gladiolus Halley. The spikes were of the largest size, some of them with nine open flowers.

Messrs. COCK AND SON, Angarrack, Hayle, had a collection of herbaceous and annual flowers. Their Paeonies call for special mention.

Messrs. W. H. PROPHET AND SONS, St. Blazey, Par Station, put up a magnificent group of Sweet Peas.

Mr. HARRIS, Hayle, and Mr. CLUNAS, of the same place, two amateur exhibitors, showed Sweet Peas of wonderful growth and colour.

Messrs. RUSE, Falmouth, showed a group of flowering outdoor shrubs which are hardy in that favoured climate—Habrothamnus, Kalmias, Clianthus puniceus, Desfontania spinosa, Embothrium coccineum, Tricuspidaria dependens, several species of Leptospermum, Vitis Henryi, and Dracaena Banksii. They also had groups of Alpines and showy herbaceous flowers.

Messrs. TRESEDER, Truro, showed a collection of hardy plants, shrubs, herbaceous flowers, Crassulas, Cacti and Tree Ferns.

Messrs. BRAY, Okehampton, Devon, put up a large group of hardy shrubs, Roses in pots, cut flowers, etc.

The DEVON ROSERY, Torquay, made a grand display with cut Roses.

READING AND DISTRICT GARDENERS'.

BY the kind permission of the Rt. Hon. Viscount Elvedon, this Society's annual outing was held at Pyrford Court, near Woking, on Wednesday, July 4, and proved a splendid success. The party left the Abbey Square, Reading, at 9.30 a.m., four chars-a-bancs being required to convey the members. On arrival at Pyrford the party was met by Mr. W. Auton, the head gardener. At the lunch served, in a marquee in the grounds, the President, Mr. Councillor Frank E. Moring, presided over a company of one hundred and one, and was supported by Messrs. Auton, A. H. Fulker (Chairman), Mr. Goddard (Vice-Chairman) and the Hon. Secretaries (Messrs. H. G. Cox and E. J. Dove).

Under the guidance of Mr. Auton a careful inspection of the gardens and grounds was made. The first thing to claim attention was the colour scheme border, divided into five main divisions, the grey, golden and blue sections being seen at their best. The grey garden contained grey-coloured foliage plants and lavender-coloured flowers; the golden garden, golden Holly, golden Privet, backed with the taller-growing, golden Planes, golden Catalpas and golden Cupressus, whilst the blue garden was planted with Delphiniums, Anchusa and Veronicas.

Passing through a long, Larch-pole Rose pergola, planted underneath with Iris germanica, the visitors came to several enclosed gardens planted with herbaceous perennials and arranged according to the time of flowering, so as to give seasonal effects. Here also were groups of small gardens such as a herb garden, scent garden and medicinal plant border, enclosed with hedge, pillars or trellis of rambler Roses.

Passing in front of the mansion, where magnificent views were obtained across the undulating downs to the Hog's Back, the rockery was reached, the chief feature being good varieties of Primula japonica, doing well by the side of the moraine and round pool. Near by was the Nymphaea garden, with its large tanks of Nymphaeas in full flower. Roses, as a rule, are not a great success, owing to the lightness of the soil, but by careful selection and trial several varieties have been found to be useful, and these are planted in beds of various shapes and sizes in the Rose garden, and together with a massive Rose pergola about one hundred yards long give a very pleasing effect. A ramble through the wild garden which has been left in almost its natural state and noticeable for its fine group of Japanese Acers of striking colour, led to the lake garden, where Japanese Irises are grown by the thousand. Fortunately the flowers were at their best and presented a gorgeous sight. The large nursery was of interest, as thousands of plants are propagated here for the upkeep of the various gardens.

At the conclusion of tea a hearty vote of thanks was accorded to Viscount Elvedon for so kindly throwing open his gardens and grounds and for his personal interest in the outing, to Mr. Auton for his endeavours to make the day such an interesting one, and to the Vice-President, Mr. Leonard Sutton, for his kind help.

The party then proceeded to the Royal Horticultural Society's Gardens at Wisley, where, under the guidance of Mr. Chittendon, a most enjoyable hour was spent. The rockery was a source of great interest, as it was in splendid condition, hundreds of plants being in full flower.

Reading was reached just before 10 p.m., all having spent an enjoyable, interesting and instructive day, thanks to the admirable arrangements made for the comfort of the party.

ROYAL CALEDONIAN HORTICULTURAL.

JULY 3.—The ordinary monthly meeting of the Society was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. W. G. Pirie, vice-president, in the chair. The meeting was an open one, and the subjects discussed were "Judging Roses," introduced by Mr. C. Comfort, and "Bastard Trenching," introduced by Mr. A. D. Richardson. Mr. W. Cuthbertson wound up the discussion, and proposed a vote of thanks to the various speakers.

The exhibits were :—Bearded Irises, from Mr. CUTHBERTSON (awarded a Cultural Certificate); Seedling Pink, from Messrs. JAMES GRIEVE AND SONS, Edinburgh; and a seedling Campanula, from Mr. W. ARMSTRONG, Musselburgh.

Obituary.

Mungo Chapman.—We regret to have to record the death, on July 12, of Mr. Mungo Chapman, a veteran Scottish gardener. We have no information regarding Mr. Chapman's earlier career, but he came into prominence when in charge of the gardens of the late Mr. Charles Jenner, at Easter Duddingston Lodge, Edinburgh. Mr. Jenner was a wealthy man, and his chief delight in his leisure hours was in his garden and its flowers, which were maintained in the highest condition by Mr. Chapman. At that time Mr. Jenner's gardens were looked upon as containing the finest collections of hardy and other plants in Scotland, outside a botanic garden, and many novelties and rarities found their way to Easter Duddingston, where they were as a rule successfully cultivated by Mr. Chapman and his staff. Among other difficult subjects successfully treated and flowered were the troublesome Ranunculus Lyallii, from New Zealand, and Mutisia decurrens, then a rare plant. Alpine plants, shrubs and border flowers were the main features of Easter Duddingston Lodge Gardens, but an admirably constructed range of glass structures provided accommodation for the many novelties cultivated there from time to time. On the death of his employer, who handsomely recognised in his will the long services of Mr. Chapman, and the disposal of the estate, Mr. Chapman removed to

Digitized by Google

Torbrex Nurseries, Stirling, where for a number of years he carried on a considerable business, mainly in alpines, in which he was a recognised authority. On his retirement a few years ago Mr. Chapman went to Plean, Stirlingshire, where he died at an advanced age. Mr. Chapman contributed several papers to the Scottish Horticultural Association, and to the Stirling Natural History and Archaeological Association.

TRADE NOTES.

IN our reference to the horticultural section of the Royal Agricultural Society's show at Newcastle, on p. 28, we inadvertently gave Messrs. Laing and Mather's title as Lang and Mather; the well-known Kelso firm was awarded a Gold Medal for its display.

IN response to a request by members of the Chamber of Horticulture every effort has recently been made to obtain a reduction in rates for all land covered by glass by endeavouring to secure the inclusion of such land in the new Bill for Rating Relief, which is now in the Committee stage in the House of Commons. Owing to the fact that glasshouses are generally agreed to range in the same category as agricultural buildings, very great difficulties immediately arose.

Notice was given of an amendment to include "farm buildings, machinery and agricultural improvements," but this was ruled out of order by the Chairman, as he explained that the preamble of the Bill clearly referred to land; therefore the Bill was purely in reference to the relief from rates to be given in respect of agricultural land only, and could not include buildings, machinery, improvements, or woodlands.

The Minister of Health, when introducing this Bill for the second reading, stated that the present measure was only more or less of a temporary nature, but he hoped shortly to circulate a draft of a Bill on valuation and rating reform to local authorities, and to ask for their observations thereon with a view to introducing the measure next year. The Bill is to contain permanent provisions in regard to the rating of agricultural land. Steps are therefore being taken to endeavour to obtain the inclusion of land covered by glasshouses as agricultural land, If this can be accomplished it would mean a very considerable relief from the high assessments under which glasshouse growers are now labouring.

The Merchandise Marks Bill has now reached the end of the Committee stage and will shortly appear on the report state in the House of Commons. Owing to the powerful opposition and delay caused by certain members of the Labour Party, it at one time threatened to set up a record for the greatest number of sittings of any Bill. The new clause, for which the Chamber of Horticulture is responsible, in reference to the sale, or exposure for sale, of imported fruit or vegetables, was introduced by Mr. Pretyman on behalf of Mr. Basil Peto and was passed on a division by a majority of 18. The following is the clause which has now become part of the Bill :—

"Any person who shall sell or offer for sale by retail any imported raw fruit or vegetables other than any kind of fruit or vegetables which is not grown in Great Britain for sale, unless such articles bear at the time of exposure for sale a label with the word 'Imported' or a word or words indicating the country of origin of the raw fruit or vegetables, or unless such articles are only exposed for sale on a slab or counter or in a separate part of his premises clearly labelled in a conspicuous manner 'Imported produce,' shall be guilty of an offence against this Act. Where such imported produce is exposed for sale or sold from a barrow or cart, any such barrow or cart shall bear a clear and conspicuous label 'Imported produce,' and such a label shall be a sufficient compliance with the requirements of this Section."

ANSWERS TO CORRESPONDENTS.

CANTERBURY BELLS: *C. E. B.* The flowers represent a very fine strain of the cup-and-saucer type of Canterbury Bell, and the shades of blue and pink are particularly pleasing.

CHRYSANTHEMUM SHOWS AT WESTMINSTER: The exhibitions of the National Chrysanthemum Society held many years ago at the Royal Aquarium, Westminster, were usually of three days' duration.

CLAYTONIA SIBIRICA AND C. PERFOLIATA: *J. F.* There was a discussion concerning Claytonia perfoliata in *The Gardeners' Chronicle*, Vol. LXXIII., pages 138, 166, 190, and 249. This species was introduced from North America in 1794, and has since become a very common weed in sandy soils of this country. The genus was named after John Clayton who collected plants in Virginia and sent them to Gronovius in England. The earliest introduction was C. virginica in 1748. Paxton's date for the introduction of C. sibirica in 1768 is correct. It was first described by Linnaeus from specimens grown in the botanic garden at Upsala. It came from Siberia, and may have been brought or sent to him by some of his correspondents. There was no need to introduce Sweet Cicely (Myrrhis odorata), which is native to twenty-five counties of England and Wales and twenty-five in Scotland. Bistort (Polygonum Bistorta) is a native to forty-seven counties of England and Wales and eight or nine of Scotland.

LOOFAH PLANTS: *A. B. O.* The plants you have raised from Loofah or Loophar seeds are, no doubt, examples of Luffa aegyptiaca, a Cucurbitaceous plant which revels in heat and moisture, and, given head-room, will attain a considerable height, trained under the rafters in a heated house where tropical plants are cultivated. The plants would grow in a Cucumber pit, but would probably take up more room than is desirable.

GROWTH ON VINE: *W. P.* The excrescence is simply a mass of cellular tissue produced by the vine as a result of some injury which the vigorous plant has attempted to cover up.

HUMEA ELEGANS: *C. J. D.* The plant is not poisonous in the ordinary sense, but, like Primula obconica, it may prove troublesome to persons with a very sensitive skin, causing a rash on the hands or arms, more specially if the person happened to get scratched. The hairs on the plant are not capable of doing this, but when the juice of the glands gets into the scratch it causes injury to some people, but not to all. There are many plants capable of affecting very sensitive skins. One of the worst of these poisonous plants is Rhus Toxicodendron, yet a gardener has been known to cut his fingers with the knife while pruning the shrub without other ill-effect than the cut. Humea elegans belongs to the order Compositae, represented by Cassinia, Chrysanthemum, Michaelmas Daisy, etc.

PAEONY DISEASED: *H. W. Redruth.* The Paeony shoots are affected with Botrytis Paeoneae, and it is advisable to remove all diseased shoots and burn them: the plants should then be sprayed with potassium sulphide solution made by dissolving 1 oz. of potassium sulphide in 3 gallons of water. In the autumn, when the plants are dying down, the growth should be cut away at the soil level and removed from the ground and burned. When the new growth appears in the spring it is a good plan to dust the plants with flowers of sulphur.

VITRIOL FOR A GARDEN PATH: *T. B.* If by vitriol you mean oil of vitriol, you would have to dilute it with water to the extent of one part of vitriol to eight parts of water. Sulphuric acid is a very caustic and quick-acting chemical, and you would need to exercise great care in handling it.

REMARKS.—A brisk demand has ruled during the past week, although there are indications of a slackening in some directions at the time of writing. A considerable proportion of the fruit that has been delivered in the market from the Continent has been very much out of condition, and the losses to the shippers must be considerable. Choice fruits, such as Grapes, Melons, Peaches and Figs, have met a steady trade, and prices have held up well. Cherries have been more plentiful, but prices keep firm. Supplies of large dessert Gooseberries have come on very rapidly, and quotations are lower. Black Currants are more abundant, and inferior fruit is selling with more difficulty, although large, bright fruits continue to sell well. The stocks on hand of Australian Apples are not large, and prices quoted are higher. English Tomatos have sold freely, but prices are now easier with the larger quantities available. Cucumbers continue in good demand. Mushrooms, after a period of lower prices, are now rather scarce, and prices have advanced. A few French Beans are still coming to hand, but generally they are showing signs of the ending of the season. Salads, while not quoted so high, are still in demand at lower rates. The vegetable trade has not been brisk during the hot weather.

CUT FLOWERS.

REMARKS.—In this department similar conditions prevail to those described last week. Consignments are difficult to clear. Carnations and Roses greatly exceed the demand, and many boxes of these blooms have arrived practically unsaleable, while nearly all consignments have suffered in transit on account of the excessive heat. Delphiniums, white Pinks and Irises are about over for this season. Nearly all Sweet Peas are poor in quality. Lilium longiflorum is supplied sufficient for the present demand, and prices remain normal. L. speciosum album and L. s. rubrum are now arriving in excellent condition. Achillea The Pearl, Alstroemeria, Coreopsis, Cornflower, Gaillardia and Godetia are all in abundant supply. Sweet Sultans are also selling freely, principally the white and mauve sorts. Statice sinuata is also arriving in excellent condition, and S. Suworowi is good. There are no new lines to record this week, though Asters are making their first appearance and are very poor in quality. There is an abundant supply of all kinds of foliage.

GARDENING APPOINTMENT.

Mr. E. Young, for three years Gardener to G. A. GIBBS, Esq., Glebe House, Morden, Surrey, as Gardener to F. L. DOVE, Esq., The Mount House, Hadley Common, Hertfordshire.

Northern Trees in Southern Lands.

The importance of timber production is now fully recognised not only by the inhabitants of old lands, but also by those of countries more recently settled. Recognising this fact, Mr. Ernest H. Wilson, whose botanical explorations have been of such great service to horticulture, has put together in a pamphlet bearing the above title* the observations of forests and forest trees which he has made in the course of his extensive travels. Of the southern lands to which Mr. Wilson refers, South Africa, so richly endowed in other respects, is deficient in readily available timber-producing trees. South of the Zambesi, the high veldt bears at best trees growing in open park-like formation. In the coastal forest fringes of Natal, Zululand and Cape Province the forests are dense, and contain many useful timber trees, of which the soft-wooded Podocarpus latifolia, P. falcata and P. Henkelii are of great value. Unfortunately, however, the representatives of these species are scattered, and, as always happens in such cases, the most accessible trees have already been removed. As Mr. Wilson points out, South Africa requires trees for two purposes, for timber production and for shade, and the need for extensive tree planting in the Union is widely recognised. Experience in this as well as other southern lands has proved that, compared with trees of northern origin, indigenous species are of slow growth; fortunately, however, many northern species take kindly to the South African climate, and hence there is no lack of suitable subjects for the afforestation of the country. The continent of Australia is as yet imperfectly known. The northern region awaits thorough exploration, particularly of its forest wealth. The centre is in the main an arid region, much of Western Australia is dry and covered with thorny scrub, but the S.W. corner of this vast region, the total area of which is one-third that of the United States, is fairly well forested with Eucalyptus, the chief species of which genus are E. marginata (Jarrah), and E. diversicolor (Karri). Hard-wooded trees there are in plenty, but no soft-wooded trees of timber-yielding value. The native Conifers—species of Callitris and Actinostrobus are small and of little or no value as timber. Callitris species, however, yield useful fencing timber in New South Wales. Whereas Victoria and New South Wales abound with Eucalyptus, South Australia is poorly forested. Queensland, on the contrary, has coastal, mixed forests rich in timber-producing species. Fortunately as it may prove, this State is less settled than others of the Commonwealth, and, as Mr. Wilson points out, its timber resources, if properly exploited, should prove a most valuable asset to it. The trees include hardwoods as well as softwoods—species of Agathis and Araucaria. Except for Queensland, the States will need to plant exotic, soft-wooded, forest trees. To discover the most suitable is, of course, the first step toward successful afforestation. The same problem confronts Tasmania, once so well stocked with hard and soft woods. In this connection Mr. Wilson observes pertinently that "a few years ago Tasmania supplied the Admiralty Dock, Dover, with a number of piles, each one hundred feet long and squared twenty inches by twenty inches at each end," so that it needs only the value of Eucalyptus for timber production to be recognised for forestry to flourish in Tasmania. In New Zealand the rain forests bear evergreen trees, with Conifers and Taxads in predominance. Much clearing has reduced the forest area, and trees like the wonderful Kauri Pine (Agathis australis) have disappeared as suppliers of commercial timber. With unexcelled but disappearing soft-wooded trees and with no hardwoods of great timber value, New Zealand needs to take steps to conserve, regenerate and replant her forests. Mr. Wilson foresees the time when the native forests will have disappeared and with them such trees as the Totara (Podocarpus totara), the Matai (P. spicata) and White Pine (Podocarpus dacrydioides), the Silver Pine (Dacrydium westlandicum), the Rimu (D. cupressinum), and the Kauri (Agathis australis)—the glories of the New Zealand forest. He predicts that their places will be taken by Conifers of northern provenance, and particularly by the Insignis and Laricio Pines and by the Larch. The soft-wooded timber tree which is proving most useful in Australia is, according to Mr. Wilson, Pinus radiata, the Monterey Pine, and so it is also in South Africa. Indeed, Mr. Wilson thinks that this tree will prove the "north's greatest gift" to these southern forests. It is truly surprising that a tree which, in its native place, is both rare and almost unused should, like the stone which the builders rejected, become the head of the corner of New Zealand and South African afforestation. But so it is. The wood of this Pine improves when grown in southern lands, and provides an extremely serviceable "deal." In the lands of its adoption it is known as P. insignis. It thrives best in South Australia, Victoria, the South Island of New Zealand, and round Cape Town. In some places, *e.g.*, Western Australia, the Cluster Pine (P. Pinaster) does better. The rate of growth of P. radiata in southern lands is remarkable. Trees in forty years reach one hundred feet in height and eight feet in girth, and the tallest is one hundred and fifteen feet by eleven feet. Happy lands, where forestry is so profitable that, as in South Australia, the net profit on seventy-three and a half acres of P. radiata amounted to $1,170 per acre with trees felled at ages between thirty-three and thirty-six years. Yet more rapid growth of this species was witnessed by Mr. Wilson in Cape Town, where thirty-three-year-old trees were one hundred and thirty-eight feet tall and ten feet in girth. Even at twelve to fifteen years after planting the Monterey Pine is large enough to cut for box wood. Over great areas of Australia, New Zealand and South Africa, this Pine will yield three crops a century of merchantable timber. The Pine was first named P. insignis by Douglas, its introducer to this country in 1831-32, but was subsequently named P. radiata. Though fast-growing here it is hardy only in certain localities. It was probably introduced into Australia through one of the Botanic Gardens and was already growing in Tasmania in 1857. Its value was discovered in South Africa from a tree growing in the Municipal Gardens. Can any fact be more eloquent of the value of Botanic Gardens and arboretums to civilisation! No one of purely utilitarian mind would have chosen this forest wastrel of California as a promising emigrant. Surely there is much food for thought here! Pinus Pinaster of the French Landes has been naturalised at the Cape, and although a slower grower than P. radiata, its rate of increase in the southern hemisphere would make northern foresters envious. Another Pine familiar to visitors to Cape Town which grows well and forms splendid avenues is the Stone Pine (P. Pinea), but on the whole neither it nor the Aleppo Pine (P. halepensis) appears to have a great future in the south. Mr. Wilson is more sanguine with respect to P. canariensis, a tap-rooted tree which should be sown in place. Of other trees mentioned by Mr. Wilson, the Douglas Spruce (Pseudotsuga taxifolia) appears likely to do well in parts of Australia, promises not unfavourably in New Zealand, but is unlikely to succeed in South Africa. Larch in New Zealand has been much planted, and in some districts is successful. In the Rotorua forest reserve is seven thousand acres of fine stands of the European Larch (Larix europaea, or decidua), and on the mountain tops, especially where frost injury is rare, it does well. Spruce (Picea), Firs (Abies), Hemlocks (Tsuga) seem to take unkindly to the southern hemisphere, but Cedars do well in parts of New Zealand and Tasmania, and so does Cupressus, species of which flourish in Australasia and South Africa. With respect to hardwoods, many species have been introduced and tried, but none so far seems to have become a proved success. Eucalyptus would appear to be the southern hardwood tree, and destined to supply much of the timber required by the world in the future. Oaks, which people of our race will go on planting, do badly; but some Willows, such as Salix babylonica, flourish amazingly in S.E. Australia and in the South Island of New Zealand, and the Crack Willow, Salix alba, is used extensively there to hold the banks of rivers. To

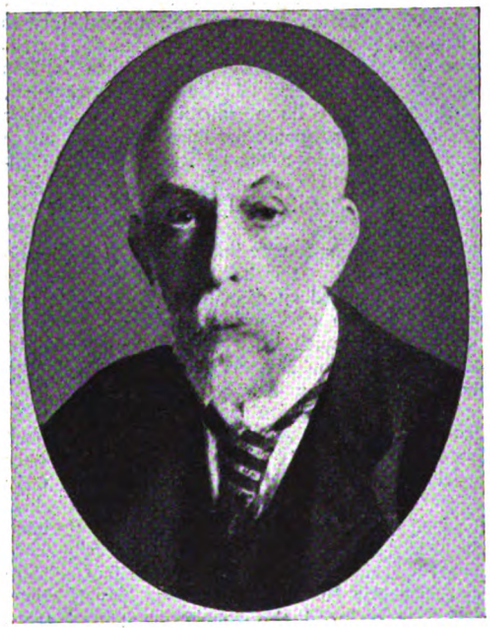
all interested in trees and tree-planting, Mr. Wilson's most readable and valuable account of the timber trees of southern lands is to be commended.

R.H.S. Gardens Club Outing.—On Saturday, the 21st inst., the members of the above club, to the number of more than fifty, journeyed from Wisley by charabanc, and others by rail, to Messrs. Sutton and Sons' establishment at Langley, where they were shown over the extensive seed grounds, now in fine condition in spite of the lack of rain in that district. The colours of the Antirrhinums, Linums, Lavateras, Gypsophila elegans Sutton's Crimson, Tropæolums and other annuals grown in great breadths were very impressive. The party next proceeded to the Crown Hotel, Slough, where an excellent lunch was provided by Messrs. Sutton and Sons. The journey was then resumed by charabanc and motor-cars to the firm's Trial Grounds at Reading, where members of the staff conducted the party in groups over the extensive premises. Here the plants are grown for trial and not for seeds, so that many varieties of a species were often grown in proximity, and thus provided a good opportunity for comparing them. Much interest was taken in the lawns and the numerous grasses desirable and undesirable in lawns and pastures. A crop of a new lawn grass, Festuca arenaria, had just been reaped at Langley, and much is expected of it on light soils. Eschscholzias Gaiety and The Geisha bore two different colours on the two sides of the silky petals, and caused considerable surprise and speculation. Lavatera, Malope, Dimorphotheca aurantiaca and its hybrids, Cosmea, Convolvulus, annual Chrysanthemums, Clarkias, Calendulas, Balsams, Pansies and other annuals too numerous to mention afforded endless entertainment. Carnations from seed were marvellously floriferous. Peas in great variety, even to the Mummy Pea and its hybrids, were inspected. Sweet Peas in pots reached to the roof in several houses, and Sweet Scabious in pots was four to six feet high. Other houses were filled with Begonias, Gloxinias, Streptocarpus and forty trials of Melons. Mr. Leonard Sutton was present at the tea provided in one of the seed houses. The annual general meeting and election of officers took place after tea, under the presidency of Dr. F. V. Darbishire. Mr. C. R. Fielder was elected President.

Siamese Plant Names.—A list of the vernacular names of the common trees, shrubs, plants, etc., of Siam, together with their botanical equivalents, has recently been compiled and published by the *Bangkok Times Press*, under the direction of the Chief Conservator of Forests, Siam. We gather from the current issue of the *Kew Bulletin* that the vernacular names are given in Siamese and roman characters and arranged under Siamese letters, as explained on the contents page. The work should prove valuable to forest officers, timber merchants and students, but, apparently, it loses much of its value to workers unacquainted with Siamese, owing to its lack of an alphabetical index in roman characters.

Freedom of Access to Stonehenge for Local Residents.—Freedom of access to the enclosure in which are the ancient Druidical remains known as Stonehenge has just been secured by an arrangement made between H.M. Office of Works and the Amesbury local authorities. The monument is to remain enclosed, but free tickets of admission will be issued to residents in the twenty-four nearest parishes. In the autumn of 1918 Stonehenge became national property, through the generosity of Sir Cecil Chubb, who had acquired it for £6,000. At one time it was claimed that Stonehenge was public property owing to certain rights of way which ran through the ground, but the claim was not capable of proof, and the owners of the property have always had the right to charge a fee for admission. When it became national property, the Office of Works was urged to admit the public free of any charge, but as it was a condition of the gift that half the fees charged should be paid to the Red Cross Society, it was pointed out that by removing the fees altogether this deserving charity would suffer. The fee was, however, reduced from 1s. to sixpence, and by the arrangement now made, even this modest amount is no longer demanded from local inhabitants. It is hoped that before long the present disfiguring fence will be replaced by a sunken ha-ha. It is calculated that there should be a sum in hand, the accumulated profits from admission fees, of at least £800, which could be devoted to this object.

Sir William T. Thiselton-Dyer.—The many friends of Sir William T. Thiselton-Dyer, F.R.S., will be delighted to learn that he is enjoying good health in his charming, quiet, country home at The Ferns, Witcombe, Gloucestershire, whither he retired in 1905, after completing twenty years' service in the Royal Gardens, Kew, first as Assistant Director and then for ten years as Director. So long as Kew remains a national institution so long will Sir William Thiselton-Dyer have an enduring monument. On the occasion of his



SIR WILLIAM T. THISELTON-DYER, F.R.S., DIRECTOR, ROYAL GARDENS, KEW, 1885-1905.

retirement his work at Kew was thus epitomised in the *Gardeners' Chronicle*, 1905, p. 424 :—"During the time that Sir William Thiselton-Dyer has been in charge even more attention than before has been paid to the horticultural department; the Temperate House has been completed, and is now by far the largest establishment in the world. Many of the other houses have been enlarged or renovated. The Herbarium has been more than doubled in size, the Museums have been overhauled, and the library has been rearranged and largely added to." Truly a wonderful record. He devoted himself unsparingly and unselfishly to the development of Kew, and had the great faculty of inspiring others with his own intense devotion and loyalty. Apart from his duties as Director, and his botanical and literary activities, Sir William took a keen interest in gardening and in Kew gardeners; he became the first President of the Kew Guild in 1893, and on that occasion in a letter to Mr. W. Watson, he wrote :—"Kew has now completed the first half-century of its existence as a national and public institution. It has accomplished work already of which any institution might be proud. It carries its influence through its men to every part of the world. That it is so strong arises in great measure from the fact that the uniform tradition which has animated every member of the staff from top to bottom is to work self-sacrificingly for Kew rather than for himself. Officials and employees arrive and pass away: the institution remains, and grows in usefulness, in strength, and in beauty. All who have had a hand in the work are content that that should be their 'record.'" Sir William is held in the highest esteem by hundreds of old Kewites scattered throughout the world, and from none will he receive heartier congratulations upon the completion of his eightieth year—on Saturday, July 28—than from those who served under him at Kew.

Royal Society of Arts.—During the present and the past two years the Council of the Royal Society of Arts has made an earnest endeavour to raise sufficient money for the purchase of the Society's house in John Street, Adelphi, and to thoroughly renovate and decorate it. The amount aimed at by the Council is £50,000, and of this sum £43,033 17s. 4d. has already been contributed.

Presentation of the Albert Medal.—On the 13th inst. the Council of the Royal Society of Arts attended Clarence House, St. James's, when His Royal Highness the Duke of Connaught, President of the Society, presented the Society's Albert Medal for the present year, in duplicate, to Major-General Sir David Bruce, F.R.S., and Col. Sir Ronald Ross, F.R.S., "in recognition of the eminent services they have rendered to the Economic Development of the World by their achievements in Biological Research and the Study of Tropical Diseases."

Spring Cabbage Trials at Kirton.—The Holland Horticultural Committee is again arranging to carry out trials of Spring Cabbage at the Agricultural Institute, Kirton, near Boston, Lincolnshire. Similar trials have been visited by growers from all over England during the past three years. The Committee is now prepared to receive seed for trial purposes, and two ounces of seed of each variety for trial should be sent, addressed to the Secretary of the Institute at Kirton.

Royal Prize at a Flower Show.—The East London Horticultural Society's exhibition which was opened at the People's Palace, Mile End, on the 17th inst., contained some six hundred exhibits. A section was set apart for exhibitors from congested areas, comprising the densely populated streets of Stepney, Poplar and Bethnal Green, these districts being represented by exhibits of undoubted merit. Queen Alexandra, who is a very keen lover of flowers and gardening in general, offered a timepiece for the best exhibit in the open class, and it was won by Mr. J. Bolt, of Alfred-street, Bow, with a very excellent decorative exhibit of flowers and foliage.

Phytopathological and Entomological Conference in Holland.—An important conference of phytopathologists and agricultural entomologists from all parts of the world was held in Holland during the week June 25-July 2. It was held under the auspices of the Netherlands Government in co-operation with various scientific institutes, and was formally opened at Wageningen by the Minister for Home Affairs and Agriculture. The meetings were presided over by Professor H. M. Quanjer, with Dr. L. O. Howard, Chief of the Bureau of Entomology at Washington, as President of Honour. The first two days were devoted to the reading of papers and the inspection of the new laboratory for Potato research, together with the experimental station at Wageningen. An interesting and extensive exhibit was displayed by Dr. van Poeteren, Chief of the Netherlands Phytopathological Service, which indicated the importance attached by the Dutch to an efficient phytopathological service, and the care and thoroughness with which they are endeavouring to protect the plants and bulbs grown for export. On the following days two excursions were organised—(1) to the Groningen Potato district, where the experiments and trials of Dr. O. Botjes, aiming at the production of "seed" entirely free from virus diseases, were examined; and (2) to the plant and bulb nurseries at Boskoop and Haarlem, members being able to join one excursion or the other. The two groups of members met again at Baarne at the W. C. Sholten Phytopathological

Digitized by Google

Laboratory, where papers and discussions were resumed. Though papers on various subjects were read, the chief interest on the scientific side was attached to the work on virus diseases of the Potato, the research and equipment of Dr. Quanjer's laboratory, and the papers on the biology of aphides being especially instructive. The principal theme on the economic side was that of import regulations and the practical value of a phytopathological service in keeping a country free from new diseases and pests, the U.S.A. Quarantine 37 being frequently referred to. A paper by Dr. H. T. Gussow, of Canada, expressed the views of an importing country, and speeches by Dr. van Poeteren and Dr. van Stogteren (Director of the Laboratory for Bulb Diseases, near Haarlem) that of exporting countries. After considerable discussion, chiefly in private, between the sessions, a resolution was come to in which all joined in expressing full agreement with the essentials of international trade and commerce in living plants—namely, reasonable freedom from all insect pests and plant diseases. The final expedition was to the Westland to examine the extensive glass area under Tomatos, Cucumbers, Grapes, Peaches, etc. The conference, which was voted an entire success, owed much to the indefatigable efforts of Mr. T. Schoevers, the Secretary, and to the Committee of Management, who arranged such an attractive programme, for all showed great hospitality and kindness during the proceedings. A full Report is shortly to be published, price about 4s., to be obtained from the Secretary, Netherlands Phytopathological Service, Wageningen. The formal proceedings terminated by a reception at The Hague by the Minister for Home Affairs, and by a dinner given by H.M. the Queen of the Netherlands.

Imports of Potatos.—Much larger quantities of Potatos were imported during June of this year than in the corresponding month of 1922. Over ninety per cent. of the tubers were received from France and the Channel Islands, the former country sending 58,000 tons and the Islands 43,000 tons. Of the total imports of Potatos to date France has supplied 69,000 tons, and the Channel Islands 56,000, the corresponding figures for 1923 being 35,000 tons and 39,000 tons respectively.

Appointments for the Ensuing Week.—Wednesday, August 1.—Lewes and District Horticultural Society's meeting; Whitchurch and District Horticultural Society's show; Sevenoaks Horticultural and Floral Society's show; Chesterfield Flower show. Thursday, August 2.—Royal Lancashire Agricultural and Horticultural Society's exhibition (3 days); Appin Flower show. Friday, August 3.—Bradford Hospital Convalescent Fund's exhibition (2 days). Saturday, August 4.—Illogan Gardening Society's exhibition; Filkins and Broughton Vegetable, Fruit and Flower show; Dumbartonshire Sweet Pea Society's show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Propagation of the Hollyhock.* Of late years the Hollyhock has assumed a prominent place in the flower garden, especially in the south of Scotland, and as this plant is very ornamental, both for the garden and the shrubbery, I send you the mode of propagating it, which I have found to be very successful, and at the same time very simple. In the month of July, or beginning of August, take a stem of the sort you wish to increase, and having divided that into lengths of two inches each cut, including an eye or bud, slice the stem through the middle and pare the central pith entirely out, so as to prevent rotting, leaving about three inches of the leafstalk remaining at the bud, in the manner of fruit budding; having prepared a little sandy soil suitable for striking cuttings, these buds are to be inserted therein horizontally, about one inch below the surface, the leaf-stalk protruding as an index of position; a hand-glass is then put over them, and in a few weeks they form nice little plants, like the current year's seedlings, and flower luxuriantly the following season, if properly treated. *J. B. Weir, Galashiels, July* 14. *Gard. Chron., July* 22, 1848.

THE ALPINE GARDEN.

ASTILBE SIMPLICIFOLIA.

ASTILBE SIMPLICIFOLIA is one of the choicest, as well as the smallest member of the genus. It is a diminutive, herbaceous species, sending up in spring a low tuft of glossy, bronzy-tinted leaves with serrated margins, but only slightly lobed. Just above these the flowering stems arise in June; graceful, airy plumes of tiny white blossoms which do not grow more than about six inches tall. These flowering sprays, that are sometimes slightly tinted with rose in exposed positions, are often produced so numerously that the whole of the little plant is canopied by a foamy mass of flowers.

This Astilbe enjoys a moderately cool, free soil. It appears to be perfectly hardy. It may be propagated by division or seed, but the latter cannot always be relied upon to produce true stock. *A. T. J.*

DIANTHUS PETRAEUS FL. PL.

THE double variety of Dianthus petraeus from the stony places of Bosnia, Croatia and adjacent regions, is a small-flowered Pink which I once obtained long since from a nursery in the south-west of England, but which I lost some years afterwards during a prolonged absence from home, when numerous plants failed. I have sedom seen this Pink offered for sale, and I have searched several catalogues for it in vain. I was, therefore, pleased indeed when I saw a large carpet of its sharp-pointed grey leaves surmounted by a host of flowers in the Royal Botanic Garden, Edinburgh, in early July. My early admiration of it has lost some of its keenness, owing to a wider knowledge of Pinks of many kinds, yet I was glad to meet with it again.

There is some confusion amongst growers regarding the single, or typical form of D. petraeus, but, so far as I am aware, no doubt has ever been cast upon the name of D. petraeus fl. pl. as applied to the plant in question. In Edinburgh it made a big mat or carpet of its grey, sharp, short leaves, and these were well covered with small, very double, prettily fringed and scalloped flowers of white. As D. petraeus varies from white to pink there may possibly be a double-pink variety in existence, although such is not recorded anywhere. I do not consider that it would be prettier than the white one. *S. Arnott.*

FIG. 18.—ROSE LITTLE JOE; NATIONAL ROSE SOCIETY'S CERTIFICATE OF MERIT, REGENT'S PARK, JUNE 28, SHOWN BY MESSRS. D. PRIOR AND SONS (SEE P. 11).

ERIGERON HYBRIDUS ELSIE.

A MOST effective useful perennial for the front row in the herbaceous border is Erigeron hybridus var. Elsie. The plant grows from 12 inches to 15 inches high, and bears large rose-pink flowers, which are freely produced from June until August. This variety is also well adapted for the rockery. *W. Logan.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

Miltonia vexillaria.—Miltonia vexillaria, with its varieties and numerous hybrids make up a family of Orchids which has few equals among flowering plants. Under proper conditions they are mostly vigorous, and it is now possible to make a good display over a long period, by keeping the plants in cool quarters. Miltonias, as cut flowers, have a short life, but as pot plants the flowers last for a considerable time, even in a dwelling house, and under electric light their beauty is much enhanced. When cultivated well they start into growth before the flowering period is over; therefore, the roots should never be allowed to suffer from lack of water, even whilst the plants are at rest. Some of the plants which produced their flowers early in the season, and were rested slightly, are now commencing to grow actively, and those that require fresh rooting material may have attention at this season, whenever the new growths are about to push forth roots.

Potting. — Miltonias are best repotted annually, for, if the compost is at all sour or decayed, there will be a general decline in the vigour of the plants. Vigorous specimens that require more root room should be shifted into larger pots, or pans—I prefer the latter, with as little root disturbance as possible, taking care that none is overpotted. Exhausted or weak plants are best divided and potted in small receptacles. It is advisable to take every opportunity of increasing the stock of choice plants, therefore the back pseudo-bulbs removed during the process of repotting should be taken care of, placed on damp moss, or even in small pots, where many will make new growths and become healthy specimens. To maintain and increase the stock of all choice plants should be the aim of every cultivator, but only by persistent effort can this be accomplished. A suitable potting compost consists of equal parts of Osmunda fibre, A1 fibre, and Sphagnum moss, with some half-decayed, broken leaves added. The pots or pans should be well drained, as the plants are surface rooters. Potting should be done moderately firmly, as the compost then remains sweet and healthy much longer than it would if placed loosely in the receptacles.

HARDY FRUIT GARDEN.

By A. J. HARTLESS, Gardener to Major J. F. HARRISON, King's Walden Bury, Hitchin, Hertfordshire.

Fruit Storage.—Fruit rooms should now be prepared for the reception of fruits. The stages should be thoroughly scrubbed with carbolic soap or disinfectant, and all woodwork stained by fruit should be scraped with glass or rubbed with coarse emery paper. Walls, and ceilings, if any, should receive a coat of whitewash, and if the floors are of cement or brick they should be thoroughly cleansed. Admit air freely, and allow ample time for the room to become dry and sweet before fruits are stored in it. Trays should be overhauled and made clean.

Woolly Aphis.—With increase of temperature this pest is increasing rapidly, and every means must be taken to keep it in check. Aphides of all kinds have become very troublesome. Paraffin emulsion, Quassia extract, or other suitable insecticide may be used.

Wall Fruit Trees.—Spraying wall fruit trees with soft water towards evening on hot days will tend to keep red spider in check; this pest is often troublesome at this time of the year, and does much harm to the foliage of wall trees.

Summer Pruning.—This operation may be undertaken, according to local conditions, from now onward. Cut back all subsidiary shoots, retaining only those required for improving the symmetry of the tree, and also any extension or leading shoots. In the case of several good varieties of Apples it is possible to summer prune them so that they will require little, if any, winter pruning, and almost without exception this applies to cordon-trained trees.

FIG. 19.—ROSA CERASOCARPA; FLOWERS ONE-SIXTH OF NATURAL SIZE.
(SEE PAGE 55.)

PLANTS UNDER GLASS.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Bulbs for Forcing.—Bulbs for early forcing should be potted during August, as successful results depend, in a great measure, on the plants being well rooted. Roman Hyacinths and Paper White Narcissus required for Christmas flowering should first receive attention, and also Duc Van Thol Tulips. Where the Tulips and Hyacinths are required in quantity a portion of the bulbs may be put into small boxes, as they may readily be lifted from them when in flower and used for making up bowls and similar receptacles for house decoration. After being potted they should be stood at the base of a wall and covered with several inches of well-weathered ashes. Mark the position of the various subjects with large labels. When they are well rooted and show signs of starting into growth remove the bulbs to cold frames.

Freesias.—Where Freesias are required for Christmas flowering they should be potted during August, and the pots plunged in ashes or leaf soil in cold frames, keeping them well shaded until they start into growth. I do not advise covering the pots with ashes or fibre, for, should they be overlooked and make several inches of growth before they are removed, they seldom recover properly from the check. Freesias always succeed best when grown perfectly cool, but if required for early flowering a little heat is needed, but the flowers so produced are never of the same quality as those from cooler grown plants.

Lachenalias.—These also are deserving of more general cultivation for the cool greenhouse. They require the same cultural conditions as Freesias. L. tricolor, and its varieties, and L. Nelsoni are the best for general cultivation.

Gladioli.—Gladioli of the nanus and ramosus sections should be more generally grown in pots, as they are very useful not only for conservatory decoration, but also for giving a supply of cut flowers. They are very free rooting plants, and I find it pays to give them larger pots than those generally considered necessary; five or six corms may be put into a 7-inch pot. Where it is desired to grow them in quantity for a supply of cut flowers they may be placed in boxes, or even planted out in cold frames. There are many good varieties, varying in colour from delicate pink through shades of scarlet to crimson. Gladiolus Colvillei, which is a garden hybrid, and its white form G. Colvillei alba, generally known as "The Bride," are largely grown for market purposes, and are equally valuable for the private grower.

THE FLOWER GARDEN.

By C. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Sweet Peas.—Plants raised under glass and planted out early in the spring have not done so well as usual—being later and less vigorous than in ordinary seasons. It will help the more backward plants if the side shoots are reduced in number and some of the flower buds pinched off as they appear. Watering should be attended to, as necessary, and stimulants given unless the trenches were well manured at planting time. Autumn-sown plants, on the contrary, have been and are still making a splendid show, giving good material for decorative work as cut blooms. It preserves the vitality of such plants to remove all seed pods as they appear.

Transplanting Seedlings.—The various biennial and perennial plants recently raised from seed have been very slow to develop. However, as the seedlings reach a handy size the strongest plants should be drawn from the seed bed and planted where light and air may assist them until they appear in their permanent quarters. Present transplanting is best done in rows spaced 1 foot or so apart, as it will then be possible to apply water easily, and to use the hoe between the rows. Myosotis, Polyanthuses and Canterbury Bells prefer a semi-shady position.

Digitized by Google

Dahlias.—The quality of Dahlia flowers will be improved if the number of growths on each plant is somewhat reduced; cut away the weak shoots and thin out the others. As regards staking, perhaps the ideal plan is to allow a strong cane to almost every stem retained, "looping-in" those stems not so supported. Where this plan is not deemed practicable, an effective and fairly neat method is obtained by fixing three stakes, triangular fashion, so that growths may be tied securely without giving the plant a bunchy appearance.

Veronica Traversii.—Large specimens of this shrub are now making a good display with their spikes of pale mauve flowers. This Speedwell is quite hardy, but too much moisture about its roots in autumn and winter will in time prove disastrous. One of its weaknesses—if such it may be called—is its failure to make growth freely after being cut back. This being so, large plants have to be left as they become leggy, or done away with entirely. Happily, stock is easily raised from cuttings or seeds.

Dead Flowers.—The regular removal of dead flowers is essential for the sake of tidiness, and also in many cases to enable the plants to continue in beauty over as long a period as possible. In addition to Violas, Sweet Peas and Roses, already mentioned in earlier notes, Antirrhinums, Pentstemons, Tropaeolums and Verbenas are especially benefited by the early removal of spent blooms. Most annuals, too, retain their vitality and freshness for a long time if not allowed to seed.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

Strawberries.—To obtain plants for forcing, the layers should be rooted without delay. The size of pot is optional; the layers may either be rooted direct in the fruiting pots, or in small pots, transferring them to the fruiting pots later. In either case, the insides of the pots should be quite clean. In layering, select the first plantlet nearest the parent, cutting back the runner to this point. When layering in large pots, arrange the latter in alternate rows to provide easy access for watering, etc. Pegs made of wood or the stalks of Bracken Fern will keep the layers in position on small pots, but for the larger pots stones or pieces of brick are suitable for the purpose. It will be found that layers which are kept in position by stones root more quickly than those pegged down. Water should be afforded the plants with extra care until the roots are growing freely in the soil; more particularly is this necessary when large pots are used, for if the soil becomes sodden the roots will receive a check, and the plants suffer accordingly. A sprinkling of clear water overhead late in the afternoons on warm, bright days will be of great assistance to the young plants. The runners rooted in small pots should be repotted at the earliest opportunity, standing the pots on a layer of coal ash in a situation fully exposed to the sunshine. The larger pots may be removed to similar quarters when the layers have rooted well in the soil.

Orchard House.—All pot trees should be plunged out of doors immediately they are cleared of their fruits, allowing ample space between them to permit of syringing and watering. The trees require careful attention to fully mature their flower-buds. Cleanliness and a liberal supply of moisture to the roots are essential to success. Peaches and Nectarines should be examined, and all useless shoots removed, it being necessary that light and air should reach the growths. Trees carrying crops that are approaching the ripening stage will need plenty of water at the roots, but none overhead until the fruit is gathered. If there is no occasion for hurrying the ripening to have the fruits for use on any particular date, allow the trees the benefit of all the light and air it is possible to give them. Stimulants should be freely afforded to trees that are carrying heavy crops, not too much at one time, but weak and often. If the growth is poor and weak, it is not wise to apply an excess of food, for with such trees root action will, in most cases, be faulty, and until this is remedied stimulants will do more harm than good. Trees on which the fruits are swelling freely should receive generous treatment, and every effort made to keep them clean and healthy. Syringe the trees thoroughly late in the afternoons, damp the house frequently when the weather is bright and hot, and admit an abundance of air whenever the weather is favourable for ventilating freely.

THE KITCHEN GARDEN.

By R. W. THATCHER, Gardener to MARK FIRTH, Esq., Carlton Park, Market Harborough, Leicestershire.

Early Potatos.—If the ground is wanted for sowing autumn vegetables early Potatos may all be lifted and placed in a dark shed. Ground that has carried a crop of early Potatos is very suitable for growing quickly maturing crops, such as dwarf Peas, small Carrots, Globe Beets, Lettuces, Turnips, and Endives, all of which will come into use in late autumn, and help to supplement the main crops. After the tubers are all lifted clear away the tops, fork over the ground, and break it down as finely as possible. Before sowing such seeds as are decided on, give the ground a good soaking of water during the afternoon, and it will be in good condition for sowing the next day.

Herbs.—Such herbs as are required for drying for winter use may now be cut, the best time being just as the respective varieties are coming into flower, as then they have the best and fullest flavour, and will better retain it. Cut the herbs when they are quite dry, and hang them in the sun for a day or so, and then remove them to a dry place under cover, where plenty of air can reach them.

Coleworts.—Make another sowing of these useful, hardy greens to withstand the winter, and net the seed-bed against birds. Coleworts may be planted 1 foot apart on any vacant ground that is firm and in good condition.

TREES AND SHRUBS.

CLIANTHUS PUNICEUS IN S.W. SCOTLAND.

THERE are not many Scottish gardens in the north in which Clianthus puniceus is successfully cultivated in the open. In the S.W., however, there are a few, and further north on the west coast it is hardy enough for a number of places in mild districts. It is, however, necessary that this Clianthus should be grown on a warm wall, although perhaps it might succeed on a trellis in a few districts. In the middle of May I had the pleasure of seeing two exceedingly fine specimens in full flower in two Wigtownshire gardens, one being that of Sir Herbert Maxwell, at Monreith, and the other in that specially favoured garden, Logan, where Mr. M'Douall has so many charming things.

In both cases the plants were growing on walls and had been unharmed by the frosts of winter and spring. The brilliant scarlet flowers were in big trusses, and great numbers of the latter were on each plant, which covered large spaces. The beautiful light green foliage and scarlet flowers produced an effect which was highly satisfactory.

I have myself failed to establish this plant in gardens further east, but there is no reason why Clianthus puniceus should not be more frequently cultivated in numerous other gardens having a genial winter climate.

A dry soil and sunny situation should be preferred. Clianthus puniceus is a native of New Zealand, where it is, I understand, becoming scarce in a wild state. *S. Arnott.*

FIG. 20.—ROSA CERASOCARPA GROWING ON THE HOUSE WALL IN SIR WILLIAM THISELTON-DYER'S GARDEN AT THE FERNS, WITCOMBE.

THE ROSARY.

ROSA CERASOCARPA.

ROSA cerasocarpa belongs to the group of Musk Roses and was collected by Prof. Henry at Ichang in central China many years ago. It is a very distinct scandent species, with a few stout, recurved prickles on its glaucous branches. The leaves are from five to seven inches long and usually five-foliolate, though occasionally only three-foliolate. The ovate or elliptic-ovate leaflets are stout, prominently veined, bright green above and glaucescent beneath. The white flowers are from one inch to one and a quarter inch wide, and borne in many-flowered cymes.

We are indebted to Sir William Thiselton-Dyer for the accompanying illustrations, Figs 19, 20, and in a recent letter to us he states that he considers that the fine double-page illustration of this species in *Bot. Mag.*, t. 8,688, gives no real idea of the beauty of the plant. He adds, "The solid trusses are unlike those of any Rose I know, and suggest an Azalea." As the flowers are followed by roundish, bright-red fruits, the plants are attractive over a long period, and it is probable that hybridists would find this species extremely useful for the production of a new race of garden Roses. The plant growing in Sir Wm. Thiselton-Dyer's garden was obtained originally from China through the late Sir T. Hanbury, of La Mortola. The flowering period is in June and July.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 5, Tavistock Street, Covent Garden, W.C.2.

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters, and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 5, Tavistock Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

THE GENTLEMAN GARDENER.

THE second decade of the 18th century was rich in the output of books on gardening by such men of repute as Bradley, Switzer and Lawrence. Less well known is the Rev. Henry Stephenson, headmaster of a Free School at East Retford, and his books are scarce. He published *The Young Gardener's Director* in 1716, and the same date is given for the first edition of *The Gentleman Gardener*. That I quote from is the fifth edition, 1764, and Johnson notes an eighth in 1769, which is hardly probable.

The heading of the pages in this book is *The Gentleman Gard'ner's Director*, and the material is arranged alphabetically in dictionary form, a form which was first used by Mortimer and carried to the utmost extent by Philip Miller. In addition to a Gard'ner's Kalender, Stephenson includes a brief chapter on the management of Bees, and a yet more brief one on home-made wines from fruit and herbs. The matter is presented in an easy, semi-colloquial style—yet brief and terse—and the book is certainly quite original, and contains much that we do not find elsewhere.

On the Pineapple, it is stated that "The Ananas was brought from—Patna near Bengal," and "its natural taste is like that of Abricot." The lists of hardy fruits contain a number of names undoubtedly English, e.g., Ladies Longing, Cushion, Mayflowers, Sheep's Snout, Lording and July-flowers in Apples. Similarly with Pears—The Maudlin, Pearl, Slipper, Norwich, Chester, Bishop's Tongue and The Squib. Again, in Plums—King's, Lady Elizabeth, Jane Plum, and Pease Plum.

In like manner lists of florists' flowers bear not only local names, but also those of the raiser. Thus we know that Fener, Fitter Potter, Woodman and Good were raisers of Auriculas; and in addition to Gilbert's list of Gilliflowers, which is copied, there are included names of "Whole Blowers," which were then the "modish taste," the cultivators of which were not the same as the Auricula-men. Since his day some of the distinctive names of floral parts have been lost. Thus we are informed that "Every bulbous Iris has nine leaves in each flower; those on the Outside are called *Chins*, those that run straight out are called *Tongues*, and the upright Leaves we term *Sails*." Leaves, it will be understood, are petals and sepals. Then Ranunculuses "were increased by—Flaps or Dugs," and of their cultivation it is stated that "old Thatch well rotted and mixed with light Mould is very proper for it."

Among other obsolete names are China Starworts, for Asters, a flower called "Double Paradise" (an Apple?). One named Lisole, which I do not recollect to have seen elsewhere, and a vegetable, Beach-Cale "brought from Italy a few years ago." The seeds sold at 5s. per ounce, and these "were first sold by Mr. Gray, seedsman in Pall-Mall." In "the second year the Sprouts may be cut several Times." The "roots" were covered with gravel drawn round about them like "an Hop Hill." Obviously this is Seakale, and the note reveals the interesting fact that this vegetable had been

FIG. 21.—LEPTOSPERMUM ERICOIDES AT MONREITH. (SEE PAGE 57.)

cultivated in England long previous to the date given in books.

In Pulteney's interesting *Sketches* it is noted that Turner, our earliest botanist, had quoted Lobel, "the seeds of the Seakale," but in this instance it may have been merely as a curiosity. Remarks on cooking are thickly interspersed throughout, and in this instance the heads are said to have been tied in little bundles and boiled

The "female Balsams," so popular 60 and more years ago, were cultivated to be placed in fireplaces in summer, the variety being white, striped with crimson or purple. At the period in question Teasel was a valuable crop, the heads being used in finishing cloths. Our author states that it was sown, 1 peck to the acre, which yielded 120 to 180 bunches, each of the value of one shilling.

Stephenson's observations regarding the cultivation of Potatos show that a practice which probably is still observed, that of planting the sets on a layer of dung, was at that early date customary. There is a very lengthy list of Peas—seven varieties of Hotspurs, five of Rouncivals, a very old type, and many others, including the "long crooked sugar Pease eaten as Kidney Beans, Shells and all," the *toute mange*, heard so much of a few years ago. When quite young the pods were eaten raw in salads. Writing of the latter, it is explained that in gathering salads a Pugil is a small handful, and a Fasciat, a large one, but no indication of the size of the "hand" is given. Of Rampions it is said that they have the same culture as Radishes, and "The roots are eaten accordingly, but are reckoned much more nourishing." Evelyn in the *Acetaria* mentions 10 roots of Rampion as enough in one salad.

Orange trees were as popular 200 years ago as perpetual-flowering Carnations are in these days, and, like other plants, they sometimes got into a sickly condition, to overcome which it was advised to water them with milk or milk and water.

The "Kalendar" is sub-divided into sections: Kitchen Garden, Fruit Garden, and Pleasure Garden, and is useful as extending the notes in the earlier part of the volume, and was probably written by another person, if we may judge from its containing dissimilar advice. In this part is the method of protecting Globe Artichokes in winter. The plants were to be cut over close to the ground, then covered with soil taken from between the rows, which is said to be preferable to litter. Once started into growth in spring, the shoots were reduced to three or four on each plant, and the offsets removed and planted to provide heads late in the year. The custom of hanging up Cabbages for seed-bearing, by their stalks, under cover for three or four days before replanting, seems strange. That of cutting off the upper part of the seed-stem in order to strengthen the parts left is, however, admirable advice.

A leaf is devoted to a discussion of "The Modish Way of Having Flowers to Blow in Winter Within Doors." "Modish," it may be explained, was a word in common use to denote anything in fashion, and even preachers of the period, and earlier, employed it in that sense. So that this expression means the fashionable custom of flowering plants in winter, just as it was fashionable to cultivate Carnations that did not burst their calyces, or, as they were termed, "Whole-Blowers."

The directions are so like those given at greater length and detail in *A Flower Garden for Gentlemen and Ladies* that it is impossible not to believe that plagiary has been committed by one or other of the parties, and not improbably this, like the "Kalendar," may be by another hand. The system was to plant spring flowering plants in basins in soil, and bulbs in glasses of water, the bulbs to rest on perforated corks. Kept in a warm room they flowered in winter. *R. P. Brotherston.*

WALHAMPTON.

WALHAMPTON, the seat of Viscount St. Cyres, lies to the N.E. of the Hampshire town of Lymington, and about 1½ mile from it.

A short time ago I had the pleasure of inspecting the gardens in company with Mr. Honess, the head gardener, and saw many shrubs and plants not often found in private gardens. In the forecourt, on the wall, is a fine specimen of Salvia Grahami with Tricuspidaria lanceolata opposite. Rose Mrs. Rosalie Wrinch, in full bloom, was a very effective plant. On the grass is a row of clipped evergreen Oaks, of pyramidal shape—rather an unusual bit of topiary work. Lapageria rosea on north walls in several places was growing well, and in the front of the house, on the wall, were Actinidia Kolomikta, with very pretty foliage; A. chinensis, a very fine specimen, Rhyncospermum jasminoides, and two species of Mutisia.

From the lawn a fine view is obtained over the water on to the Isle of Wight. Near this lawn are the shrub borders, which are being reconstructed, and when finished they will be very effective. Even now they are full of interest. The borders are on each side of a wide strip of grass which leads down to the lake.

Digitized by Google

Pittosporums are well represented, and P. Silver Queen was very good. Cistus Silver Pink took my fancy, as did several species of Erica. E. australis was just passing out of bloom; E. cinerea coccinea was in full bloom; it was very striking, and is, I think, the finest variety of all. A splendid lot of Desfontainia spinosa attracted attention, as did several Plagianthuses, P. Lyallii promising a fine show of bloom. Polygala myrtifolia, with its purple blossoms, was very showy. Embothrium coccineum is also very fine here. Leptospermum Nichollii is good, and L. Chapmannii, as large specimens, was smothered with flower buds, which were just opening.

Nearer the water side is a wide border of herbaceous plants, and this was very effective. Close by is the wild garden, a mixture of woodland and water, and one of the prettiest I have seen. There are two pieces of water, one a large pond, and the other a lake. I was sorry to be too late to see the wonderful effect of Azalea colouring from across the pond. Near by is a fine planting of Camellias in variety, all big bushes, and close to these are specimens of Eucalyptus which, planted out four years ago, are now about 30 ft. high, and remarkable examples of these exotic trees. By the water side I noticed a fine lot of an evergreen Fern—Lomaria.

In a sheltered clearing under some large Scotch firs, Musa japonica, I think, is growing, and here are more fine specimens of Eucalyptus, and some large, shapely plants of Tricuspidaria lanceolata, full of bloom, but not so fine as the big specimen at Pylewell. I noticed Metrosideros lucida coming into bloom; this I believe is rather rare and not often seen in flower. Cistus populifolius was very fine, and the evergreen Mitraria coccinea, climbing over a stone pedestal, was brillant in colour. Ixias and Sparaxis were blooming close by, and also a colony of plants in flower, which puzzled me until I got close to it, and found it consisted of Cyclamen persicum, naturalised at the base of the Scotch Firs, with Lachenalia Nelsonii adjoining, but just out of flower.

In a hollow, Richardia Mrs. Roosevelt and R. Elliottiana were growing, and Desfontainia spinosa represented by plants of all sizes, each well furnished with good foliage, and with nothing of the ragged, bare look that so often characterises this plant.

This was my first visit to Walhampton gardens, and I have omitted in this note reference to many interesting plants, but I have not forgotten the kindness of Mr. Honess, or the fine condition of the plants under his care, so many of which are seldom seen in such splendid condition out of doors. Walhampton is a most attractive place, and I was struck by the blending of the foliage of the shrubs, which forms almost a colour scheme. I have never seen this idea worked out before, and it is well worth considering in large plantings of shrubs, as it is very effective; I think I am right in saying that it was Lady St. Cyres' idea, and Mr. Honess has carried it out remarkably well. *Visitor.*

GARDEN NOTES FROM S.W. SCOTLAND.

THE effect of the dismal, dark summer of 1922 has been very apparent in the sparse flowering of many shrubs and trees that bloom on the previous season's growth. Hawthorn, common and alpine Laburnums, Horse-Chestnuts, shrubby Spiraeas, Philadelphus, and several species of Rhododendron are conspicuous examples of this. It is partly due to reaction from the extraordinary profusion of blossom borne by such plants in the summer of 1922, but chiefly to the want of sunshine in that year to mature the season's growth.

But there is one family of shrubs—Olearia—that never vary in the wonderful profusion of flower that they produce year after year. One might have expected that these Daisy-bushes, being natives of Australia, New Zealand, and the Chatham Islands, would be specially dependent on plenty of sunshine to ripen their annual growth; and, in fact, except O. Haasti, it is only in relatively mild districts that they can pass safely through British winters. But "relatively mild" is the character of the climate over a large part of our islands, covering all the south and west coast of Great Britain as far north as Duncansby Head, including the Western Isles, specially favoured districts on the east coast, such as the Moray Firth, and nearly all Ireland. Within that range there are vast numbers of gardens, in very few of which is any use made of Olearias. Yet they are of special value in maritime places, being impatient of overhead shade and enjoying the buffeting of sea winds, nor do they suffer from full exposure to winter gales.

When in flower these evergreens are very decorative. O. stellulata and O. nitida are at their best in May, the latter growing from 8 to 10 feet high.

The leaves of O. nitida are broadly ovate, 2 inches to 3½ inches long, leathery, shining green above and clothed with smooth white tomentum beneath—they are almost entirely hidden by the dense corymbs of white blossom. O. macrodonta follows in June, and is a taller plant which may reach a height of 20 feet (Fig. 22); O. ilicifolia comes into flower a fortnight later. The foliage of both those species is very beautiful in winter. Very different in appearance are O. chathamica and O. semidentata, both from the Chatham Islands, having lanceolate leaves 3 to 4 inches long, very leathery, and clothed on the underside with pure white tomentum; the flowers of both species are solitary on long footstalks, the ray florets of O. semidentata being purple, those of O. chathamica white tinged with purple, the disk florets of both species being dark violet. These flowers have the peculiarity of increasing in size after opening, and measure two inches across when fully expanded. These two species require moderately moist soil, being impatient of drought. O. nummularifolia, again, is quite distinct from any other species that we grow here, a far-spreading bush 6-8 feet high, the branches densely set with very thick, appressed leaves ¼ to ½ an inch long. Unlike others of the genus, it is uncertain in flowering; last year the bushes were white with blossom in July, this summer there is not a flower to be seen.

Olearia Haastii, flowering in July and August, is thoroughly hardy everywhere, and very well known in British gardens; while O. Traversii, tallest of the family, rising to a height of 30 feet, may be recognised from having opposite leaves, whereas in all the other species named here they are alternate. As a flowering shrub O. Traversii is a fraud, the innumerable axillary panicles that promise so fair in bud resulting in a mist of dingy, yellowish blossom. This species is not worth growing, except in a botanic garden.

FIG. 22.—A TREE-LIKE SPECIMEN OF OLEARIA MACRODONTA IN SIR HERBERT MAXWELL'S GARDEN AT MONREITH.

The flora of New Zealand is peculiarly rich in plants of the order Compositae. In the genus Senecio, our own Groundsel and Ragwort are but the poor relations of S. Greyi and S. laxifolia, whereof the sheets of golden blossom are so well set off by the silvery foliage and snow-white, young growth and flower buds. S. Huntii forms a small tree 20 feet high, and S. Hectori, more tender than the rest, is distinguished by its handsome foliage, the leaves being grass green, 6-12 inches long and 3-5 inches broad. The ray florets in this last species are white.

Where the climate will not allow the Manuka—Leptospermum—to be grown in the open, some of the species are well worth training against a wall. L. scoparium, with white flowers, and its varieties Nichollii, with crimson, and Chapmannii, with pink flowers, and L. ericoides (Fig. 21), are the best for such a position; but the full beauty of these graceful shrubs can only be seen where the climate admits of their being grown in the open. Full sunshine and plenty of wind are what they like. L. lanigerum is of more compact habit, making a rounded shrub 6 to 8 feet high. *Herbert Maxwell, Monreith.*

HARDY FLOWER BORDER.

THE GIANT THRIFT.

Of the many forms of Thrift, Armeria plantaginea gigantea is unquestionably the finest. From close tufts of olive-green foliage, rise stout flower stems to a height of two feet and more, terminating in large, globular-shaped heads of small flowers of a delightful shade of glistening, rosy pink. Another handsome variety is Ruby, bearing globular heads of ruby rose flowers; it is from 15 to 29 inches high. These tall Armerias are very attractive when associated with herbaceous perennials, on account of their bright green foliage and numerous heads of flowers produced on stiff, wiry stems during spring and summer. The dwarf kinds are particularly useful as edging plants, and all the Thrifts are easily cultivated.

ASTER SUBCAERULEUS APOLLON.

This is a showy edging plant, with dense, tufted habit. It flowers from May onwards, and produces flowers in great profusion. These are extra large, fully three inches across, and a pretty shade of lavender blue, with conspicuous orange centre. The whole plant is from 9 inches to 12 inches high.

ASTER DIPLOSTEPHIOIDES.

This species of Aster (see Fig. 23) belongs to the same group as A. subcaeruleus, but is rather taller growing, the flower-stems, which are unbranched, attaining a height of about eighteen inches. It is a very floriferous plant, producing, as the illustration shows, a wealth of mauve-coloured blossoms with a satiny sheen, and set off by a beautiful yellow disc passing to light orange. The flower-heads measure three or four inches across.

The plant grows freely in rich soils, and increases rapidly by means of surface runner growths. It is best grown in a mass, when it presents a beautiful patch of colour, and the blooms supply excellent material for decorative purposes in the dwelling-house.

MORINA LONGIFOLIA.

This is a hardy herbaceous perennial that attracts many growers by reason of its handsome spiny foliage, and singularly strange resemblance to the Thistle family. It is from the Himalaya. The large, spiny tufts of evergreen, prostrate leaves are very effective, and from June to September spikes from 2 feet to 3 feet high rise erectly, and are as attractive as anything I know. The flowers are produced in whorls on the erect, stately stems, and are a pretty combination of rose and white, with a very agreeable aromatic odour. The plant requires an open position, in ordinary well-drained, deep and fairly moist soil.

SUNSET LUPINS.

The perennial border contains many beautiful flowering plants, and is illuminated by their grandeur during certain months in the year, but few plants suitable for the herbaceous border produce flowers of such varied hues and colour combinations as the Sunset Strain of Lupinus polyphyllus. The inflorescences are from 12 inches to 18 inches long and borne on tall, stately stems. Such Lupins are practically indispensable during May and June, as their pyramidal branching spikes and beautiful foliage are extremely effective. The plants revel in a fairly deep and rich soil, in full sun or partial shade, and if severe cutting away of the early flower heads is practised as they fade, a second crop of flowers will be produced during the autumn when they will be highly appreciated.

FIG. 23.—ASTER DIPLOSTEPHIOIDES.

NEPETA MUSSINII.

One of the most attractive of Catmints, Nepeta Mussinii is already a garden favourite. Introduced from the Caucasus during the early part of the 19th century, this Nepeta is unquestionably one of the most desirable perennials to form edgings to herbaceous borders, carriage drives, or indeed to plant anywhere where a permanent edging is in request, furnishing, as it does, dense, neat prostrate tufts, and numerous lavender-blue flowers in great profusion, from 15 inches to 18 inches high, from May until September. It is easily propagated by division or cuttings.

Nurserymen have made selections of this continuous blooming plant and forms of a better habit than the type, and with superior coloured flowers are now available. *W. Logan.*

AQUILEGIA CAERULEA MRS NICHOLLS.

Among the numerous improved forms of Aquilegia this form of caerulea is decidedly the best. The individual flowers are much larger and of a deeper colour than the type, and when seen growing in a mass the effect is beautiful. *Paul T. Moore.*

NOTICES OF BOOKS.

The Origin of the Bagatelle Rose Gardens.

"Bagatelle is two hundred years old; its history is composed of little tales, little names, little costly, elegant trifles, the toys of princes . . ." Thus the author of this very interesting little work* commences his historical description of the tiny estate in the Bois de Boulogne, of which the "château" was built during 1775, in two months of frenzied night and day labour to satisfy the caprice of a boy-prince.

The first Bagatelle, however, was in existence in 1716, during the Regency, although the exact date of construction of the original building is not known. Bagatelle was much further from Paris in those days than it is now, and the Bois de Boulogne, of which the estate had originally formed a part, made it a delightfully quiet retreat. So thought the Regent, who thoroughly appreciated its discreet retirement; so, a little later, thought the emancipated Louis XV.; so also, later still, thought his grandson, the young Comte d'Artois, in the gay spring-time of his life—the same count, who, in the sad years which followed his return from exile, was glad, in old age, to get back to the little château and its peace and quietness once more.

When the young Comte d'Artois took over Bagatelle, he was dissatisfied with the château and determined to replace it. He had at one time the astonishing intention of building it on the Mont Valérein itself, whose beautiful wooded slopes formed one of the most charming of the views of the vicinity. Luckily he found the site unsuitable and abandoned the idea. The author of the book under review tells in some detail the well-known story of the building—how the prince took a whim into his head to give, in the new house, a feast to his young sister-in-law, Queen Marie Antoinette, on a day scarcely two months distant. It was not difficult in those days for a prince to indulge his caprices. For instance, when building stone was found to be lacking, Swiss guards were sent along the roads to commandeer—for cash to the full value, be it said—any carts of this material which happened to be passing! The little château cost its owner in the end 1,200,000 livres, the approximate equivalent of a pre-war three million francs. However, he recovered 100,000 livres from the queen, who had wagered that sum that he would not have the château ready in time for the fête.

At the end of the eighteenth century, what were known as "English gardens" had begun to be popular; gardens, that is to say, which had curved paths instead of straight ones, artificial brooks instead of square, stone-rimmed ponds, and grass lawns in the place of paved walks. Nowadays these gardens would not seem very natural, but then they were considered triumphs of imitation, and English gardeners were specially imported to form and tend them. Such a gardener the Comte d'Artois introduced to Bagatelle in the person of one Blaikie. The young proprietor asked for, and easily obtained from his all-too-complaisant royal brother, permission to enlarge his little domain at the expense of the Bois de Boulogne, and it contained then about 16 hectares, enough for Blaikie to work on with success.

One of the chief attractions of the garden was a water pump, suitably disguised, by which water was drawn up from the Seine, and ran through the grounds with quite a "natural" effect. Unfortunately, either because money ran short or from some other cause, the "river" which was to run through the gardens and surround several artificial islets, stopped short half way, so that one of the islets, prematurely and rather gloomily named "L'Ile des Tombeaux," remained high and dry.

Belanger, the architect of the house, who had a considerable share in designing the gardens, gave (or was to have given) some years later a lecture on gardening, which he concluded by

* *Bagatelle et ses Jardins*, by J. C. N. Forestier, Conservateur des Promenades de Paris. 2nd Edition. Paris, Librairie Agricole de la Maison Rustique, Rue Jacob, 26.

Digitized by Google

this ponderous peroration, in a style of oratory then immensely admired :—

'Choisir un site salubre, productif et agréable, enrichir son voisinage de tous les différents aspects que peut conquérir la vie pratique, des promenades . . . y réserver des repos, élever des autels à Flore, à Céres, à Pomone, à la Céleste Amitié, tel doit être le but, qui conduit l'homme sensible à se créer un jardin. . . ." ("To choose a salubrious site, productive and agreeable, to enrich it in every way possible, to prepare pleasant ways, to encourage repose, to raise altars to Flora, to Ceres, to Pomona, to friendship, such should be the aim of the man of refined taste, when he would make to himself a garden.")

The gardens at Bagatelle had a great vogue for the few last years before the Revolution: all the fashionable world of Paris at times strolled along its winding paths, admired its artificial streamlet, or supped pleasantly in the little château. Then came the first mutterings of the coming storm; in 1789 the stream of wealthy emigrants began to cross the frontiers. Bagatelle, deserted by its owner, was for three years a prey to the malicious and idle curiosity of the Paris crowds, and even after that, though nominally cared for by the State, was used as a picnic ground by all and sundry.

Not until 1812 did Bagatelle again become a royal residence. Nor was it the proud Bourbons who now graced its gardens, but the puny King of Rome, Napoleon Bonaparte's only son, who was brought there by his nurse to breathe the pure air of the Bois. Three years later came another turn of fortune's wheel, and Bagatelle was again abandoned. Later on, the old Comte d'Artois, no longer the dashing youth of bygone days, gave the little estate to his son, the Duc de Berry, and for a time it seemed as though Bagatelle might enjoy a permanent revival; but 1830 came, and exile again, and after years of neglect, and almost oblivion, it passed into the hands of an Englishman—Lord Yarmouth, soon afterwards to become Marquis of Hertford.

"Lord Yarmouth," says the author, with a touch of good-humoured sarcasm, "is declared, for the sum of 313,100 francs, owner of Bagatelle and its water-pump!" Perhaps the gardens did then contain little of value besides the pump; at any rate, Lord Hertford, though anxious to preserve every possible amenity, seems to have made considerable alterations in the gardens, levelling the steep slopes beyond the Orangery, and making a horse-ride. The new owner of Bagatelle was fortunate in being able to acquire a little more land, and the total area become 24 hectares, as compared with 16 in the time of the Comte d'Artois. Lord Hertford also made some alterations in the château, chiefly in the shape of the roof and the rooms on the first floor. A landscape gardener named d'Alphand was employed to remodel the garden, and it is to him that the large lawn at the east of the pavilion is due, besides other improvements.

Lord Hertford died in 1870, but Sir Richard Wallace, his son, was quite as interested in Bagatelle as his father had been. He it was who removed the Pages' House, and built another small dwelling known as Trianon, which, however, was never inhabited. M. Forestier regrets the disappearance of Pages' House, and also the fact that the alterations made in the château have marred the graceful lines of the original; but he admits, both in father and son, a "goût passionné" for Bagatelle and its surroundings.

After the death of Sir Richard Wallace in 1890, Bagatelle fell into desuetude. In 1903, rumours were heard that it was to be sold by auction, and it is to the credit of the Paris municipal authorities that, with the energetic aid of M. Forestier, they never rested until in 1905 they were able, for the sum of six and a half million francs, to add Bagatelle and its gardens permanently to the amenities of the Bois de Boulogne.

According to M. Forestier, Kew was the model which he and the authorities had in mind when planning the development of Bagatelle. The idea of the Rosary, where practically every variety of Rose known to horticulture should find a place, seems to have been evolved by degrees. The collection was generously started in 1907 by M. Gravereaux, who sent a large number of named specimens; and there are now no fewer than 12,000 different varieties. None of these, however, dates back for its introduction further than the beginning of the 19th century; the oldest is Rose du Roi, introduced in 1812.

The author, now on his own ground, as it were, leaves the historical aspect of Bagatelle, and discusses its present condition. He frankly condemns the soil, from the Rose-grower's point of view. "It is of such bad quality," he says, "that good soil has had to be imported in considerable quantities; in spite of every care, Roses at Bagatelle are frequently not so free-flowering as they are in private gardens. The soil," he adds elsewhere, "is composed of sand and gravel, very unsatisfactory (*ingrat*) for every kind of cultivation." It seems a pity that these conditions should await the new Roses sent each year by hopeful growers; for in Paris at least the results of the trials would carry weight.

The author gives an interesting account of the rest of the gardens—for the Rosary is only a part of the domain, though, perhaps, the part nearest to M. Forestier's heart. He gives a useful list of the Roses, under their various sections, and also lists of novelties to which awards have been made in the various trials. A final chapter, unnamed, consisting of a discourse on gardens in general, is less interesting than the remainder of the book; which, however, in spite of its real interest, and the patient research it must have occasioned, is, we are bound to admit, poorly arranged. The method is apparently chronological; yet the account of the acquisition of the gardens by the municipality, omitted in the first edition, now forms a kind of preface. After describing the vicissitudes of the estate, and bringing us safely to the year 1905, the author jumps back, and gives some very valuable contemporary accounts of Bagatelle under the Comte d'Artois, which would have been much more appropriately placed in their datal order. Then the illustrations, though excellently chosen and reproduced, are not all quite happily placed; for instance, a view of the modern Rosary flanks one of the obelisk and cascade in 1780; and a view of Bagatelle in that same year is placed opposite the text which describes the old château, demolished three years previously.

These small defects, however, can easily be remedied in any future editions of a book which should prove of value to all who are interested in horticulture and the annals of Paris.

FIG. 24.—HYACINTH VAN TUBERGEN'S SCARLET.

THE BULB GARDEN.

VAN TUBERGEN'S SCARLET HYACINTH.

I THINK there is ample room for a good bright, deep red Hyacinth, which lends itself to "early work." General Pelissier is a good old variety; but it is not to be compared with Van Tubergen's Scarlet. The new comer is a sport from the old, but not over well-known deep claret, Distinction, and has very much the same habit of growth. The flower spike is on the small side, but what it lacks in size it more than makes up for in its smart, refined appearance. The photograph (Fig. 24) was taken on December 23, 1922.

I ought to add that the bulbs of the plants shown in the photograph had been "prepared." There is no doubt very considerable strides have been made of late years in the technique of their preparation, and I would urge my English friends to take advantage of this and cultivate "prepared" Hyacinths largely. Treated exactly the same as ordinary bulbs, I find they bloom from ten days to a week in advance of them. *Joseph Jacob.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM GRANDE AND ITS ALLIES.

ODONTOGLOSSUM grande, the largest and one of the most beautiful members of the genus, has been well represented in gardens since it first flowered in the collection of the Duke of Bedford, at Woburn Abbey, in 1841, from plants collected by Mr. G. Ure-Skinner at Guatemala. Many importations have been made since then, the flowers showing considerable variation in occasional forms, although the large yellow with deep chestnut-red markings is the type. O. grande Pittianum is almost entirely yellow, and there are other forms with slight markings.

Odontoglossum Insleayi, collected in Mexico, flowered in gardens about the same time as O. grande. It is of similar habit and colour, and some variation is shown in different importations, the varieties splendens and leopardinum being the showiest, whilst Mr. C. J. Lucas's O. Insleayi aureum is wholly yellow, like the colour-suppressed form of O. grande.

O. Schlieperianum, now flowering in several gardens, and which was first imported from Costa Rica, is intermediate in character between O. grande and O. Insleayi, and some variation in the colour of the flowers occurs, the light yellow form being now in flower with Messrs. Sanders.

But the interesting point which deserves attention in these days of intensive hybridisation, when other members of the genus have been crossed with most other members of the class—and with others of different genera, including Cochlioda, Miltonia and Oncidium—is that no satisfactory record of hybridising any member of this section with other Odontoglossums, or of intercrossing the three species referred to, has yet been given. O. Williamsianum, a reputed natural hybrid between O. grande and O. Insleayi, which flowered in the collection of Comte de Germiny, near Rouen (Rchb. f. *Gard. Chron.*, Vol. XVI., 1881, p. 134), at that time a rare plant, imported from Costa Rica, probably with O. Schlieperianum, has always been considered a very doubtful record, for it is not authenticated that the two supposed parents grow together. Subsequent importations of O. Schlieperianum have produced similar forms to the one named Williamsianum, as well as connecting varieties of the type. In 1895 Mons. Charles Vuylsteke was reported to have raised O. Insleayi × O. crispum, the former being the seed-bearer, but the plants seem to have failed to mature. Probably others have had experience in crossing these, and their remarks would be interesting and might help a very desirable effort to make the "break" which would open up a new class. Even crossing the species of this small section should give interesting results, and among other points might settle the question of the O. Williamsianum record. *J. O'B.*

ONCIDIUM TIGRINUM.

ONCIDIUM TIGRINUM is a most useful winter-flowering Orchid, which makes better growths when cultivated in an intermediate temperature than when subjected to cool treatment. It has been resting since maturing its pseudobulbs last season, but is now beginning to grow again. Until the flower spikes appear in the young growths, very little water should be given the roots, but as the spikes and growth develop, the supply of moisture should be increased. When new roots develop any necessary repotting may be done. If the plants are exhausted by the strain of flowering, it is advisable to remove the spike forthwith. It is not good policy to attempt to flower the plants two years in succession.

EPIDENDRUM VITELLINUM MAJUS.

THE winter flowering variety of the brilliant Epidendrum vitellinum majus is a cool-house Orchid which should be repotted when the new growths are about to develop fresh roots. Employ shallow pans furnished with ample drainage, and either suspend the pans or stand them on the stages near the roof glass in a light, airy part of the cool house. Water should be applied sparingly during the early stages of growth, but when the roots become active, more liberal supplies are necessary, until the season's growth is completed. During the resting season only sufficient water is needed to prevent the pseudo-bulbs shrivelling. *J. T. B.*

CULTURAL MEMORANDA.

LACHENALIAS (CAPE COWSLIPS).

As the most suitable time for planting Lachenalias is approaching, possibly a few notes with reference to their successful culture may be welcome. It is a Cape bulb, and although introduced many years ago, it appears to be too seldom grown, considering the minimum of trouble it gives and the beauty of its flowers and foliage. The former resemble pendulous bells set round a stout stalk, which is some six to eight inches high, and the colour is generally of a greenish yellow shade, occasionally marked at the edges by red or crimson. The foliage is in some varieties blotched with dark splashes, somewhat similar to the leaves of our British Orchis maculata. As soon after July as the bulbs can be obtained they should be planted in 6-in. pots, four to six in each pot. A mixture of sand, leaf-mould, and a little old turfy loam will suit them well. No water will be required until growth commences. A cold frame will suit them until severe weather is at hand, then, as they are but half hardy, a greenhouse is the most suitable place for them, and if a temperature of 45° to 50° is maintained they will thrive and flower about April.

Lachenalias may also be grown in a warm, sunny window in the dwelling house, yet not quite so happily. I must, however, confess that my interest in these plants was first created by seeing a potful of them blooming freely in a cottage window. After flowering the plants should be gradually dried off by withholding water. Repotting the plants annually is not necessary; the exhausted soil may be removed down to the bulbs and fresh material added. Suitable kinds are Nelsonii, golden yellow; L. pendula, red, edged green and L. tricolor, orange, yellow, and green. *T. D. T.*

PLANT NOTES.

HELICHRYSUM HUMILE.

THERE are several varieties of Helichrysum, which, like Phaenocoma, has beautiful, so-called "everlasting" flowers. This plant succeeds under the same cultural conditions as Phaenocoma, and may be propagated at this season of the year by means of half-ripened side-shoots, failure to root them successfully generally results from careless trimming of the cuttings. In days gone by this plant was better known under the name of Aphelexis humilis. *C.*

AOTUS GRACILLIMA.

THIS beautiful Australian greenhouse plant may be successfully propagated during July by means of half-ripened, twiggy side-shoots, which root readily in a sandy soil, stand the cutting pots under a bell glass in a cool greenhouse. Aotus gracillima, with its slender, drooping shoots, is seen to best advantage when grown as small standards. To obtain good heads it is best to stop the young plants once, and, when they break, to train up two or three shoots, rubbing out all side-shoots until the stems are 2½ feet to 3 feet high, when they should be pinched for the formation of the future head. Established plants, which flower during the spring, should be pruned hard after they have finished flowering. A few cuttings should be inserted each year, as the plant is not long-lived under cultivation. *J. C.*

CABBAGE ROOT FLY.

AMONGST the disasters which are caused by the Cabbage Root Maggot there is one which is not mentioned on p. 25 (*Gard. Chron.* of July 14 last), yet, so far as I have observed, it seems always correlated therewith. I refer to "going blind" in Broccoli, etc. The heart bud fails and no head develops. At much later dates some side shoots may develop, but for a long while the few existing leaves merely ripen and grow to some extent. Examination of such plants always reveals root maggot damage.

This "going blind" is a useful index when finally planting out from a nursery bed; in fact, the greatest use of the nursery bed planting seems to be a mode of combating the pest. It seems especially after planting from the seed bed that attack takes place, for the remaining plants in the seed bed do not, in my experience, usually show signs of the mischief. By the use of the nursery bed, one not only obtains more stocky plants and more resistance to removal, but one can select specimens which have not been fly-infested. The causation of the production of tiny heads in Cauliflowers is more often due to conditions of temperature and other checks to uniform and rapid growth; thus, usually, a superfluity of wintered seedlings leads me to plant some out. Without protection, and given cold or uncongenial weather, the results are miserable, whilst plants for which protection can be afforded progress well.

On the whole, I think that the Red Cabbage varieties are less prone to attack than others, but I have seen them badly stricken. Some defoliation when planting out most seedlings generally leads to aerly accession of vigour,

Another point, which is perhaps not without importance in combating the pest, arises from the observation I made some years ago, that, when pupating, the maggots locate themselves some inches from the stem, in the zone of the peripheral roots. The result is that when the plant is simply pulled out of the ground, the pupae remain well protected from wandering birds; if, however, a spade is used and the infested ground loosened and turned, there is a better chance for birds to pick them up.

With regard to deterrents; some years ago I tried safrol, in the form of artificial Sassafras oil, about 10 c.c. of which was incorporated with sifted sawdust (one pint shaken down); the dust was heaped round the plants and caused them no inconvenience; unfortunately, that season there was but little attack by the fly and too few of the controls suffered. I have not yet retried this material. Nitrobenzol was tried the same season. Otherwise, I have used the tarred squares and relied upon selection from the nursery bed.

When the reddened, coppery appearance of a leaf is recent, I have succeeded in getting good plants from stricken Cabbages, but not Cauliflowers, by digging them up carefully, placing the whole root with much earth in a bucket of water, and carefully washing away all maggots and soil: the plant is then replanted by puddling it in. Watering with thiocarbonate of potash or saturated solution of carbon disulphide has had no good effect; perhaps from too late an application, for damage is really done before it is appreciable from inspection of the growing plant. *H. E. Durham.*

FRUIT REGISTER.

STRAWBERRIES UTILITY AND THE EARL.

DURING the present drought and on a light, dry soil, Utility and The Earl have alone given good crops; nine other varieties of Strawberries have failed. It is very refreshing to see it announced that copious rains have fallen in certain parts of the country, but in this district the ground is practically dried out. Our rainfall for the past two months amounted to only 0.91 inch. In these conditions our Strawberry beds are dried up, so there is no prospect of obtaining runners. *A. B. Wadds, Englefield Gardens, Reading, Berkshire.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Gardeners' Wages (see p. 10).—The low wages paid to gardeners is not, as some correspondents have suggested, a post-war problem, but the result of a system that obtains in no other trade or profession. The head gardener in a large establishment received low wages, but was allowed house, light, coal, vegetables, fruit, and often milk, butter, rabbits, game and other foodstuffs for himself and family. To this may be often added prize money, judging fees and, at one time, 5 per cent. commission on everything purchased for the garden. These allowances converted a low wage into a comfortable income. Now comes the injustice of this system. The wages of foremen and journeymen were based upon the head gardener's *wages* and not upon his *income*, and their allowances were usually bothy, milk and vegetables for self only. The wages paid to gardeners in smaller establishments in the same district were also based upon the wages paid in the large establishments, while the allowances were proportionately smaller. To alter this system now would be very difficult, but the fact remains that gardeners should be paid wages commensurate with their knowledge and ability, and should themselves pay for their house, light, food, etc. Much has been written regarding organisation and the failure of previous attempts to organise gardeners. I am fully aware of the difficulties attending organisation, also the evils that exist in the trade union movement, but those who are ready to condemn unions should remember that even in a public parks department the trained gardener does not receive as much in wages as the blacksmith, painter, or carpenter employed in the same department. This seems still more strange, when we know that the majority of men in charge of such departments are gardeners. Is there a remedy? It seems to me the race of men is fast dying out or going into retirement who have raised the standard of British horticulture to the high position it now holds. Will these men, who have great influence with all garden lovers (and all good employers are that), devote the remaining years of their lives to an endeavour to make the workers in the garden as happy as they tried to make the plants in their garden? *S. Alvia.*

Claytonia perfoliata.—I read with interest your reply to *J. F.*, in your issue of July 21 (p. 50), regarding the Claytonias. It recalled to me the fact that when botanising in the S.E. of Kirkcudbrightshire, along with the late Mr. M'Andrew, between twenty-five and thirty years ago, we came upon a colony of Claytonia perfoliata in a secluded glen at a considerable distance from any other place we knew, or afterwards found, where this plant was observed. Mr. M'Andrew, perhaps the best-informed botanist of the south-western counties of Scotland, with the exception of Mr. G. F. Scott-Elliott, told me that it occurred in a naturalised state in several areas in the district, but that these were widely scattered, and in most cases a good way from each other. *S. Arnott.*

Sparrows and Cerastium tomentosum.—Referring to the interesting note by *J. P. Carlisle*, on page 43, it is to be feared that sparrows do not confine their attentions to Cerastium tomentosum, or, as an alternative, to the flowering stems of Alyssum saxatile. They are particularly destructive to some of the Mossy Saxifrages, and good masses in my garden have been badly mutilated in former years by these birds. Your correspondent's information about the traps is good news, and many folks who have trouble with sparrows in their gardens will probably discover whether traps will be effective, even if unbaited and "unset." One wonders if these would prove of any use in keeping sparrows away from the golden Crocus, that beautiful spring flower these birds delight in pulling to pieces? *S. Arnott.*

SOCIETIES.

IPSWICH CENTENARY SHOW.

THE centenary show of the Ipswich and East of England Horticultural Society was held in Christchurch Park on Wednesday, the 11th inst., and it was a conspicuous success as well from the point of view of the number and excellence of the exhibits as from that of the management. The great marquees, completely filled with groups of plants and flowers and artistic table decorations, were admirably arranged to enable the individual exhibits to be inspected without the slightest personal inconvenience, except that caused by the weather, over which neither the officers nor the committee responsible could be expected to have control.

Christchurch Park is an ideal venue for a flower show, but the heat on the 11th inst. was so intense that it was quite impossible to enjoy the many handsome features in any degree of comfort. Officials, judges and visitors alike suffered, but the fact that it was the finest display of plants and flowers that has ever been brought together in East Anglia remains incontrovertible.

Roses were superb and numerous, and the competition in practically all the principal Rose classes was exceedingly keen. Messrs. Frank Cant and Co., Colchester, secured the first prize and challenge bowl for 36 blooms, distinct, with a set notable for its excellence; Messrs. B. R. Cant and Co. and Messrs. D. Prior and Sons followed in the order named. Messrs. B. R. Cant and Co. and Messrs. D. Prior and Sons were first and second prize-winners for 12 Roses distinct; while for 12 Teas, distinct, Dr. Pallett, Earl's Colne, with a refined and beautiful exhibit secured the premier position; Messrs. D. Prior and Sons were second for Tea Roses.

In the grand centenary class for a representative group of Roses arranged on a floor space of 12ft. by 10ft. Messrs. A. J. Allen, Norwich, were handsomely first, with Mr. Walter Easlea, Leigh-on-Sea, as a keen runner-up. Messrs. B. R. Cant and Co. won for a representative group of cut roses, and were followed by Messrs. Morse Bros., Woodbridge. Roses were splendidly shown in several classes by amateurs.

The display of Sweet Peas was of surprising excellence and extent when the weather is taken into consideration. The open class for a collection arranged on a table space 18ft. by 5ft. was won by Messrs. R. Bolton and Sons, Baythorne End, with a magnificent exhibit in which colour, size, refinement and artistic arrangement were all alike conspicuous; this being the firm's third win in the class, the challenge trophy, presented by the President of the Society, Sir F. J. C. Ganzoni, M.P., becomes Messrs. Bolton's property, but they can still look ahead, since the donor has promised to provide another trophy. In the section for amateurs' Sweet Peas Mr. A. E. Garrod, Stowmarket, was easily the most successful competitor with several beautiful exhibits.

Carnations were excellent in quality, but not as numerously staged as might have been anticipated, especially by amateurs. In the open classes Mr. H. Lakeman, Thornton Heath, carried all before him. There were several classes for various cut flowers and the contests were noticeably keen owing to the general high standard of the exhibits. Similarly in the pot plant classes, but here the individual exhibits were not, as was only to be expected, so numerous.

Table decorations and other classes calling for artistic arrangement were delightfully displayed and caused the greatest enthusiasm and the inevitable controversies as to respective merits. Open and local classes for fruits and vegetables demonstrated the patience and skill of many growers and were very creditable throughout.

All the praise for the collective excellence and beauty of the show must not, however, be accorded to the competitive sections. There were beyond these the trade displays, and they may be described in a word as magnificent. The fact that Mr. R. C. Notcutt, Woodbridge, secured the coveted challenge bowl for the best trade exhibit must not be taken to mean that the others were substantially inferior—the margin between the best and the remainder was a thin line which left every contributor in an honourable position. Among those represented were Messrs. Thompson and Morgan, Ipswich; Mr. J. Mann, Ipswich Arboretum; Mr. H. J. Pierce, Ipswich; and the Britannia Nurseries, Ipswich, with the several firms whose names are recorded as showing Roses, Sweet Peas and other things in the competitive classes.

ELSTREE AND DISTRICT HORTICULTURAL.

THE exhibition held annually by the Elstree and District Horticultural Society is one of the best of the village flower shows in this country, and, notwithstanding the unfavourable season, the exhibition this year, on Saturday, the 7th inst., was again a remarkably fine one. The show is held in Aldenham Park, and the gardens of Aldenham House are thrown open to the inspection of visitors, constituting, as one of the speakers at the luncheon aptly described it, one of the finest non-competitive exhibits attached to any show in the country. In other directions, the Hon. Vicary Gibbs gives valuable support to the show, including his services as a judge in the more important classes.

The day was gloriously fine, and large numbers of visitors were present, the majority taking the opportunity of inspecting the Hon. Vicary Gibbs' beautiful gardens, which were in their full summer glory. The chief attractions, besides the summer bedding, were the seedling Delphiniums, the new Bamboo garden, and the houses of Streptocarpus and scented-leaved Pelargoniums, the collection of the last being the most complete in the country.

This exhibition is noteworthy for Roses and Sweet Peas, and on this occasion some outstanding exhibits of these flowers were staged. In the class for an exhibit of Roses occupying a space 9 feet by 3½ feet, Messrs. CHAPLIN BROS., winners of the first prize in 1923, again excelled, and their exhibit was so excellent the judges awarded it a special commendation in addition to the first prize, which included a silver challenge cup. They arranged their blooms in tall pillars with epergnes at the corners, one sort in each stand, the more notable varieties being K. of K., Isabel Innocence, Mrs. Henry Morse, Lady Pirrie, and the Rev. Page Roberts. Messrs. HARKNESS AND CO. were awarded the second prize; and Messrs. F. CANT AND CO. the third prize.

In the class for twelve distinct varieties of Roses Mr. J. H. HART, Potters Bar (gr., Mr. A. J. Smith), last year's winner, was again successful. His blooms of Mabel Drew, Caroline Testout, Joseph Hill, A. E. Coxhead, and Molly Bligh were of outstanding quality; second, Mr. G. I. E. Pryor, Preston, Hitchin, who had fine flowers of Modesty and Nellie Parker.

Sweet Peas were of equal merit as the Roses, and Mr. EUSTACE E. PALMER, Drayton House, Sherfield-on-Lodden, Hampshire (gr., Mr. J. Dibben), was successful in the majority of the classes. This exhibitor won first prize for twelve distinct varieties, with exceptionally fine flowers of Tangerine, Mrs. A Hitchcock, Valentine, Constance Hinton, Mrs. Tom Jones, Geo. Shawyer, and others. Mr. J. GUTTRIDGE, Woburn Green, who was placed second, had splendid vases of Jean Ireland, Bunty and Royal Scot. Mr. PALMER excelled easily in the class for six distinct varieties in which four competed. His outstanding varieties were Orchid, Hebe and Constance Hinton. Mr. GUTTRIDGE was again second; he showed a very excellent vase of Royal Scot. Mr. PALMER was also successful in Messrs. Sutton and Sons' class for six bunches of Sweet Peas, and in the colour classes for (*a*) pink, with Elegance; (*b*) lavender, with Orchid; (*c*) cerise, or scarlet cerise, with Royal Scot; and (*d*) crimson, buff, or ivory, with Matchless. Dr. LEGGATT (gr., Mr. E. J. Pratt) had the best vase of a white variety in Constance Hinton, and the best vase of a crimson or scarlet variety in Charity.

Digitized by Google

Non-competitive exhibits added greatly to the success of the exhibition. Messrs. SUTTON AND SONS staged a magnificent display of Sweet Peas, for which a Gold Medal was awarded. Sweet Peas of extraordinarily good quality were also staged by Major ALBERT PAM (Silver-gilt Medal), and by Messrs. IRELAND AND HITCHCOCK, Marks Tey (Gold Medal).

Mr. J. C. ALLGROVE, nurseryman, Middlegreen, Slough, showed Roses of exhibition quality in boxes (Silver-gilt Medal). Mr. AMOS PERRY showed a comprehensive exhibit of hardy flowers interspersed with specimen hardy Ferns (Silver-gilt Medal). Mr. C. ENGELMANN had one of his outstanding exhibits of Carnations (Silver-gilt Medal). These flowers were also well shown by Messrs. W. CUTBUSH AND SON, who, in addition to Carnations, staged a number of greenhouse plants (Silver Medal). Messrs. CARTER, PAGE AND Co. put up a very large exhibit of hardy flowers, alpines and Dahlias (Gold Medal). The most remarkable, however, of all these exhibits was the collection of one hundred and fifty dishes of vegetables staged by Mr. BECKETT. It is difficult to know how to appraise each succeeding exhibit of vegetables by Mr. BECKETT, but this certainly was one of the best he has ever shown, and we have never seen Peas of better quality, from either Mr. BECKETT or any other exhibitor, the pods of Quite Content variety being magnificent. All kinds of vegetables from Potatos to Mustard and Cress were included in the collection, and the judges awarded the exhibit a large Gold Medal and special Silver Cup.

BRITISH MYCOLOGICAL.

ABOUT twenty-five members of the British Mycological Society visited the South-Eastern Agricultural College, Wye, on Saturday, July 7. This was the first purely phytopathological meeting of the Society, and it was appropriate that it should be at such an active centre of research. After Mr. E. S. Salmon, Head of the Mycological Department of the College, had given a short sketch of the manner in which it was proposed to spend the day, the College Farm was visited. A walk through a field of Potatos, on the look-out for "mosaic," "leaf curl," and the similar peculiar troubles that the Potato is heir to, led to the experimental Hop garden, with its large numbers of varieties, where examples of the "mosaic" disease of the Hop were shown. Plots of Wheat and of Barley, where the treatment of the seed with formalin for the control respectively of "Bunt" and "Covered Smut," is being investigated, were then inspected.

The party was then conducted by Mr. Ware over the Botanic Garden, which is managed for the production of class material. Numerous Grasses exhibited their appropriate rusts, and a Barberry bush showing a few aecidia was a sufficiently rare sight in these days to interest several of the party. The disease of Red Clover caused by Glaeosporium caulivorum was in evidence, and it could be seen very clearly that certain strains of the Clover showed a marked resistance to the disease. The variety trial plots of Wheat and Barley were then visited, and the incidence of Rusts noted. A return was then made to the College, where an excellent lunch was provided by the Governors and Principal, in the fine old monastic refectory. The visitors found the brand of cider affected by the college exceedingly attractive.

After lunch the party divided, Mr. Salmon and Dr. Wormald explaining their researches to the two sections in turn. The former showed his new varieties of Hop, resistant to Hop-mould (Sphaerotheca humuli). Different plants were on view exhibiting all degrees of attack, from complete susceptibility, through semi-immunity to complete immunity—a more striking series, or one more clearly displayed to the naked eye, could scarcely be imagined. The exhibition of plants of immune and susceptible varieties twining around each other ought to convince even those Hop growers who argue that the plants become mildewed owing to the soil, the cold east wind, or the acts of the King's enemies.

Dr. Wormald showed cultures of "Brown Rot" fungi, where the differences in growth of Sclerotinia fructigina and the forms of S. cinerea referred to for convenience as S. f. pruni, S. f. mali, and S. f. americana, are very clear. He further demonstrated his inoculation experiments of crown gall on young Apple stocks and parallel cultures of the organism he has isolated from Apple galls, with strains of Bacterium tumefaciens obtained from America. Cultures of organisms associated with a bacterial leaf spot and die-back of Cherry and Plum together, with preliminary inoculation experiments, were exhibited.

An adjoining farm was then visited, where there is a severe attack of "blindness" in Barley, caused by Helminthosporium gramineum. The fruit plantations had the usual Apple mildew, Apple Scab, brown rot of Plums, etc., and gave rise to a number of interesting discussions. By this time the high temperature was producing a physiological drought, and tea in the delightful old library was much appreciated—the College-grown Strawberries vied in popularity with the cider at lunch.

Mr. F. T. Brooks, chairman of the sub-committee for Plant Pathology, in proposing a vote of thanks to the governors, principal, and the members of the Mycological Department, spoke of the high position the College held in matters of plant pathology, and Mr. J. Ramsbottom hailed the head of the Department as the father of British Plant Pathology.

Much was seen and discussed during the visit which was one of the most enjoyable of any made by a society which has a reputation for pleasant meetings. The Phytopathological excursions will certainly become an annual event—and Wye has set a very high standard.

READING GARDENERS'.

NEARLY one hundred members and friends of the Reading District Gardeners' Mutual Society paid a visit to the University College Gardens, Shinfield, on Saturday, July 14, with the object of inspecting the Sweet Pea Trials of the National Sweet Pea Society, carried out by Mr. A. J. Cobb, Trial Superintendent of the Society. There were 150 lots, the seeds being sent by experts residing in all parts of the country, and supposed to be of new varieties or improvements on old varieties. Owing to the very hot weather experienced the blooms were slightly past their best, yet the trials were very interesting. Other things to interest the visitors were Tomatos, one house alone containing 1,300 plants. Grapes, the vines having been grown from eyes planted by the students in January, 1921, and transplanted the following July. These were fruiting for the first time, each vine averaging ten bunches, Carnations and Peaches (Violet Hâtive was ready for gathering). The outdoor fruits, as in other districts, are not doing so well as usual; in fact, Cherries and Plums are failures, and Apples only a fair crop, the best cropping varieties being Newton Wonder, Worcester Pearmain, and Cox's Orange Pippin.

In connection with this meeting a Sweet Pea competition was held for the members, and notwithstanding the unfavourable weather the flowers have experienced some fine blooms were shown, although short in stem. The judges' awards were as follow:—For three vases of Sweet Peas, three distinct varieties, twelve stems to a vase, own foliage, 1st, Mr. J. B. LOWE, Croft House Gardens, Pangbourne; 2nd, Mr. H. WELLAND, Merton House Gardens, Reading; 3rd, Mr. F. J. GREEN, Aldermaston Court Gardens. One vase of Sweet Peas, one variety, eighteen stems, own foliage.—1st, Mr. W. GOWER, Calcot Grange Gardens, with Sutton's Black-seeded Cream; 2nd, Mr. J. B. LOWE, with Royal Scot; 3rd, Mr. H. WELLANDS, with Mrs. Tom Jones. One vase of Sweet Peas, mixed colours, eighteen stems, own foliage.—1st, Mr. H. REEVES, Broadfield House Gardens, Reading; 2nd, Mr. T. C. WAITE, Basingstoke Road, Reading.

ROYAL HORTICULTURAL.

JULY 24.—The Royal Horticultural Hall was well filled with exhibits on this date, but there was a distinct falling-off in the attendance of Fellows and visitors. Stove plants, Carnations, Pinks, Delphiniums, Gladioli, Phloxes, Dieramas, Scabious, Roses, scented-leaved Pelargoniums, Water-lilies and Gooseberries were the chief attractions. There were few novelties, and even the Floral Committee had a comparatively short sitting, although it awarded no fewer than twenty-seven medals to groups. The two exhibits of Gooseberries, one from Mr. Allgrove and one from the Wisley Gardens, were of great interest and considerable educational value. It was a thousand pities that Mr. Allgrove's magnificent exhibit should have been crowded into one end of the Orchid annexe, while there was at least one ample vacant space in the body of the hall where it would have been far better displayed and therefore of greater value to the visitors.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Messrs. Jas. O'Brien (hon. secretary), Gurney Wilson (assistant secretary), C. J. Lucas, Clive Cookson, Chas. H. Curtis, J. E. Shill, Fred. K. Sander, H. T. Pitt, Arthur Dye, Stuart H. Low, and Pantia Ralli.

CULTURAL COMMENDATION.

To Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells, for a most remarkable albino variety of Odontoglossum percultum (album) (ardentissimum × Rolfeae). The plant, which was in a small pot, exhibited exceptionally good culture, and bore a gracefully disposed nine-branched spike of fifty-nine flowers. It is a remarkable variation and the first albino of the cross, the flowers being white with purple markings on the lip. The hybrid has reverted towards O. Pescatorei, which is in each of the parents, and the colours have been eliminated.

OTHER EXHIBITS.

Messrs. STUART LOW AND Co., Jarvisbrook, Sussex, were awarded a Silver Banksian Medal for a very effective group, at the back of which was the elegant mauve and white Oncidium incurvum, and Cattleya Warscewiczii varieties and hybrids, the best of which was C. Van Houtte Low's variety (Lord Rothschild × Warscewiczii), a grand flower with rosy mauve sepals and petals and broad ruby-purple lip. Among Laelio-Cattleyas were good forms of L.-C. Canhamiana, L.-C. Aphrodite and L.-C. Dominiana, and among species noted were the pretty Epidendrum prismatocarpum and Bulbophyllum Lobbii Colossus.

DR. MIGUEL LACROZE, Bryndir, Roehampton (gr. Mr. Taylor), exhibited the new Brasso-Cattleya Siatiago del Estero (B.-C. Digbyano-Mendelii × C. Hardyana), with mauve-tinted sepals and petals, and very showy, ruby-purple, crimped lip, with large yellow centre and gold lines on purple at the base.

PANTIA RALLI, Esq., Ashtead Park, Surrey (gr. Mr. Farnes), showed the new Odontioda Eclipse (Oda. Madeline × Odm. Alexandrina) with its first two flowers, which are large, heavily blotched with dark ruby-purple, the margins, tips and front of the lip being white.

Messrs. SANDERS, St. Albans, staged an interesting selection in which the natural hybrid form of Odontoglossum excellens, the pretty Cattleya Majali Sander, and good hybrid Cattleyas were noted. Interesting species included the rare little Dendrobium asperifolium which was first shown by Sir Jeremiah Colman, Bifrenaria tetragona, the true Brassavola Digbyana, the parent of one of the showiest races of hybrids; Cypripedium Godefroyae ochrochilum, a large, pale yellow flower with purple markings; and several species of Vanda.

Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells, showed a fine home-raised form of Cattleya Hardyana, also C. Warscewiczii Fr. M. Beyrodt.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), showed Odontoglossum Purple Emperor, Pitt's variety (The Czar × Dusky

Digitized by Google

Monarch) with three noble flowers of large size and perfect shape, the broadly ovate segments meeting at the edge. The colour is intense violet-maroon, the margins having a thin, silver-white line, and the front of the lip is white. The plant was not entered for the consideration of the Committee.

Floral Committee.

Present: Messrs. H. B. May (in the chair), D. B. Crane, J. F. McLeod, John Heal, Geo. Harrow, W. B. Gingell, Andrew Ireland, G. Reuthe, J. Jennings, J. B. Riding, Gerald W. Loder, H. R. Darlington, C. Williams, W. P. Thomson, T. Hay, Thos. Stevenson, Hugh Dickson, J. W. Barr, H. J. Jones, H. V. Warrender, M. C. Allwood, Reginald Cory, R. C. Notcutt, E. A. Bowles, W. J. Bean and Sir Wm. Lawrence.

AWARDS OF MERIT.

Dierama pulcherrima var. Heron.—An exquisite variety of an extremely beautiful and graceful plant. The spikes are four feet tall, arched, and bear pendulous clusters of flowers, the latter of a rich purple colour shaded with maroon. Shown by the DONARD NURSERY CO., Newcastle, Co. Down.

Cladrastis sinensis.—Discovered by Pratt in Szechuan in 1890, and introduced to cultivation by Messrs. J. VEITCH AND SONS, through their collector, Mr. E. H. Wilson, in 1901, Cladrastis sinensis is a deciduous late-flowering tree of considerable garden value. The tree is freely branched, and almost every branchlet bears a terminal, pyramidal, branched panicle of small, fragrant, white, Pea-shaped flowers, with a small brownish-yellow mark at the base of the recurved standard. The large, soft green leaves, glaucous beneath, are usually composed of from thirteen to twenty-five leaflets. Cladrastis sinensis, the Chinese Yellow Wood, is quite hardy and a useful garden subject by reason of its lateness and freedom of flowering. Shown by the DIRECTOR, Royal Gardens, Kew.

Aristolochia gigantea.—This species is quite distinct from A. gigas, having smaller leaves and smaller, differently shaped flowers. A plant of A. gigantea is now flowering freely in the Mexican House at Kew, where it is a great attraction. The flowers are large, broadly heart-shaped, crimson, with mottlings of buff, and with a dull yellow centre where entrance is given to the curved and inflated spur-like base. Most of the Aristolochias have flowers with a very unpleasant odour, but A. gigantea is an exception, as its blooms possess a fragrance suggestive of the crushed leaves of Lippia citriodora—the Lemon-scented Verbena. Shown by the DIRECTOR, Royal Gardens, Kew.

OTHER NOVELTIES.

The DONARD NURSERY CO. exhibited a series of beautiful forms of the graceful Dierama pulcherrima, in several shades of colour from white to deep purple; these made a fine show in the Committee-room, and are referred to in connection with the firm's exhibit in the hall.

Hydrangea Sargentiana, with large mauve-pink heads and a ring of white bracts, was shown from Kew; as exhibited, it is a strong-growing species with big, soft green, ovate leaves. The specimens were grown in the shade of big Rhododendrons in the Temperate House. An interesting Cooperanthes, named Sweetheart, with one white flower on a small bulb, was shown by Sir W. LAWRENCE, Burford Lodge, Dorking; it was raised by Mr. P. Lancaster.

GROUPS.

Roses were shown in moderate quantity and of fair quality, by half a dozen or more growers. That the season has not been favourable to Roses has been abundantly clear at nearly all the shows. The ORPINGTON NURSERIES COMPANY associated a fair number of standard varieties with some very attractive vases of Iris Kaempferi (Silver Flora Medal). Messrs. WATERER, SONS AND CRISP displayed vases and stands of many Roses. The tall stands of Los Angeles and Lady Pirrie were above the average merit of the blooms in the hall (Silver Flora Medal). Ophelia was represented by a large stand of excellent blooms, in the collection of Messrs. D. PRIOR AND SONS (Silver Banksian Medal). The free flowering cluster varieties were most prominent in the exhibit of the Rev. J. H. PEMBERTON, and these included Vanity, Moonlight and Paul's Scarlet Climber (Silver Flora Medal). Mr. A. EDWARDS showed Roses and Gladioli (Bronze Flora Medal), while on a table under the clock Mr. ELISHA J. HICKS set up several vases of Dorothy Dix, a very attractive dwarf variety, much like a looser built, more rose-coloured Ellen Poulsen.

Herbaceous Phloxes were freely shown, and of much better quality than might have been expected in view of the difficulties of the season. Just inside the entrance Mr. H. J. JONES set up one of his handsome collections, in which the colour associations were particularly happy. He had a great many varieties, in goodly sized baskets, and of these it was such brightly coloured sorts as Homeland, Dr. Koningshofer, Jessie Waters and Coquelicot that demanded most admiration (Silver-gilt Flora Medal). Mr. JOHN FORBES included in his collection such good pink coloured varieties as Aurore, Pierre Bayle and Baron M. Dedem. He also showed some very good Pentstemons (Silver Banksian Medal). Mr. G. REUTHE included herbaceous Phloxes in a general collection, which also contained some interesting Liliums; the spike of L. chalcedonicum was very vividly coloured (Silver Banksian Medal). Asthoes were associated with Phloxes and other border flowers by Messrs. SKELTON AND KIRBY.

A large stem of Sidalcea Rose Queen was greatly admired in the collection of border flowers displayed by Mr. W. WELLS, Junr. (Silver Banksian Medal). Messrs. BEES, LTD., showed Delphiniums, Queen Mauve, The Villian and Starlight. Salvia turkestanica and Chrysanthemum maximum Mayfield Giant, were prominent in the exhibit of Mr. FRED. G. WOOD (Silver Banksian Medal). Various border flowers and alpines were staged by Mr. M. PRITCHARD (Silver Banksian Medal), while Mr. T. CARLISLE included well-flowered examples of Delphinium Belladonna, in an interesting collection of border flowers (Bronze Flora Medal). Messrs. CARTER, PAGE AND CO. showed Violas and Alpines (Bronze Flora Medal). Mr. R. G. DOWNER included very good Gaillardias in his exhibit (Bronze Flora Medal).

There was a spendid mass of Lavatera Olbia rosea in an extensive collection of herbaceous flowers set up by Messrs. B. LADHAMS, LTD. (Silver Flora Medal). The Misses HOPKINS, the WEST END NURSERIES, and Messrs. J. PIPER AND SONS also showed hardy plants.

A long stretch of tabling was filled by Messrs. KELWAY BROS. with good spikes of Gladioli. There were many varieties of Primulinus hybrids, but the larger flowered types predominated, and amongst these Thos. Bruce, Lady M. Digby, and Queen Mary, which have a vivid crimson blotch on white or cream ground, were very prominent (Silver Flora Medal). Messrs. LOWE AND GIBSON had an interesting collection of Gladiolus hybrids and un-named border Carnations (Bronze Flora Medal).

The wide range of colours to be obtained in the annual Scabious was well shown by Messrs. SUTTON AND SONS, who had large vases of named colour varieties; Black Prince and Mauve were especially good (Silver Flora Medal).

An uncommon and most successful exhibit was made by Major ALBERT PAM (gardener, Mr. F. Streeter), Warmley, Bury, Broxbourne. This was a goodly sized hardy Nymphaeas pool surrounded by tall, graceful Bamboos and elegant grasses. The Nymphaeas were of great merit and included Wm. Doogue, James Bryden, Escarboucle, Galatee, Conqueror, chromatella and albida (Silver-gilt Flora Medal).

At the opposite end of the Hall the Hon. VICARY GIBBS (gardener, Mr. E. Beckett), Aldenham House, Elstree, contributed a valuable collection of "Scented Geraniums." There was great variety, and in addition to their fragrance many of the plants had distinct claims as flowering subjects. These included Scarlet Unique, Crimson Unique, Zermattii, conspicuum, Miss Godolphin Osborne and Prince of Orange (Silver-gilt Banksian Medal).

In the centre of the Hall Messrs. L. R. RUSSELL, Ltd., arranged a large circular group of their excellent stove plants. On tall stands such Nepenthes as N. Sir W. Thiselton-Dyer, N. Henryana and N. Dominiana were especially furnished with their interesting "pitchers." The ornamental foliage species included a variety of splendidly-grown Codiaeums, Cordylines, Marantas, and Caladiums, while amongst the flowering plants the chief were Ixoras in variety, and Thurbergia grandiflora (Silver-gilt Banksian Medal).

Carnations were staged in their accustomed quantity and quality. Messrs. ALLWOOD BROS. had a blazingly beautiful central stand of Edward Allwood, and also included a beautiful stand of mixed Perpetual Malmaison varieties (Silver-gilt Flora Medal), and Mr. C. ENGELMANN (Silver Banksian Medal) also showed excellent blooms. Mr. C. H. HERBERT had a fascinating collection of his valuable border Pinks. Amongst them were such beautiful perpetual varieties as Queen Mary, Sweet Nell, Victory and Ruby, while the best of the laced Pinks were Bertram, Diana, Harry Hooper, Iona and Rosebud (Bronze Banksian Medal).

On behalf of T. A. BULL, Esq., of High Top, Norwood, W. R. Portal, Esq., showed some excellent plants of hybrid Gloxinias (Silver Banksian Medal). Messrs. J. CARTER AND CO. had a very interesting group of Trachaelium coeruleum bearing large heads of cloudy blue flowers, surmounting the deeper blue of Browallia speciosa major (Silver Banksian Medal).

The DONARD NURSERY CO. had an exquisite group of countless specimens of the uncommonly graceful spikes of Dierma pulcherrima and several varieties. Their new Heron and Osprey were very fascinating. They also included in this large group plants of Desfontainia spinosa and many Iris Kaempferi (Silver Flora Medal).

Fruit and Vegetable Committee.

Present:—Messrs. C. G. A. Nix (chairman), J. Cheal, S. B. Dicks, Geo. F. Tinley, W. J. Jefferies, J. Wilson, F. Jordan, J. Vert, E. Beckett, E. Neal, T. Pateman, J. Harrison, W. H. Divers, W. Lobjoit, E. A. Bunyard, A. N. Rawes, H. V. Taylor, E. Harriss, and A. Metcalfe.

Messrs. LAXTON BROS. showed their new late Strawberry named Omega, which they claim to be the latest cropping variety in cultivation. The fruit is of large size, oval in shape, and of a very rich scarlet colour. The plant makes a very large crown and fruits with freedom.

Mr. J. C. ALLGROVE showed an exhibit of Gooseberries, for which a Gold Medal was awarded. It is a pity that this outstanding exhibit of fruit was placed in the annexe, for it was missed by several of the visitors. The collection comprised some eighty different sorts of Gooseberries, with a few Red Currants. The Gooseberries were of remarkable quality and exceptionally large in size. The gathered fruits were arranged on dishes, with triple cordon bushes in pots at the back, the trees carrying an abundance of large, luscious berries. The principal varieties shown were Gretna Green, Dan's Mistake, Leveller, Whitesmith, Clayton, somewhat like Crown Bob; Careless, white; Sulphur, Speedwell, a hairy red berry; Langley Beauty, golden; Langley Gage, of small size but of exceptional flavour; Golden Gem, Early Green Hairy, and Pitmaston Greengage.

The well-known variety Leveller was shown by Mr. Allgrove for award, but the Committee decided to recommend its inclusion in the trial of Gooseberries at Wisley in 1924, and this recommendation was also adopted in the case of Raspberry Brocket Hall, shown by Mr. T. Pateman.

The competition for the Bunyard medal resulted in two exhibits of Gooseberries, from Mr. F. S. Stoop, Byfleet (gr., Mr. G. Carpenter), and Sir C. Nall-Cain, Brocket Hall (gr., Mr. T. Pateman), respectively. Mr. Stoop

Digitized by Google

showed thirty-two varieties and was awarded the Silver-gilt Bunyard medal, whilst Sir C. Nall-Cain's collection comprised only fifteen dishes and was awarded a Bronze Bunyard medal. Both exhibits contained fruits of excellent quality.

Obituary.

William Scott.—It is with regret that we announce the death, on July 16, of Mr. William Scott, for many years gardener at Drumpark, Kirkcudbrightshire. Mr. Scott, who was an able gardener, was for many years with the late Mr. and Mrs. Kay, of Drumpark, and retired a few years ago, when, on the death of Mrs. Kay, the estate passed into other hands, and went to live in Maxwelltown, where he died at the advanced age of 77 years. For a considerable time he was a well-known exhibitor, principally of fruit, at the Edinburgh and local shows and gained numerous awards, while in other departments he was an equally proficient gardener.

INQUIRIES.

ACORUS CALAMUS.

WE shall be glad to hear from any reader resident in the Fen country who has the Sweet Flag (Acorus Calamus) growing in large variety and is willing to dispose of it.

CLEMATIS GUIDING STAR.

I SHALL be glad to know if any readers of the *Gardeners' Chronicle* have Clematis Guiding Star true. I have bought plants under this name more than once and in every instance instead of being Guiding Star the variety has turned out to be Duke of Edinburgh. I believe it was in the year 1875 that the variety Guiding Star was sent out by Messrs. Cripps and Sons, of Tunbridge Wells, where I was then foreman. The variety was one of my own raising and I should therefore be happy to pay any reasonable price for a plant if I could get it true.—*H. Collyer.*

ANSWERS TO CORRESPONDENTS.

BROMPTON STOCKS: *I. B.* The specimens received were very fine, and you certainly have an excellent strain of these beautiful flowers. The spikes are large, free branching, and the flowers full-sized and sweetly fragrant.

CANKER IN MELONS: *S. T., Derby.* A reply to your query *re* Canker in Melons appeared in our issue of July 14, p. 25.

DELPHINIUM FASCIATED: *A. V.* The observations made in a reply to *W. N.*, regarding fasciation in the Ox Eye Daisy apply to your case also. Fasciation is probably more frequent in highly cultivated plants than in those poorly grown.

FOXGLOVES WITH CUP-SHAPED TERMINAL FLOWERS: *A. R. R.* and *J. E.* Foxgloves with terminal, cup-shaped flowers are by no means uncommon, indeed, seedsmen offer strains which produce this peculiar style of flowering which is known as peloria.

GARDENER'S NOTICE: *G.* You are entitled to four weeks notice, and should give up possession of the cottage at the end of four weeks, but if you do not, your employer would have to take ejectment proceedings in the local county court. This would take time, and even then it would be for the judge to use his discretion as to whether he would make an Order for immediate possession. If you cannot find accommodation elsewhere, most judges would decline to make an immediate order for possession, especially as there is another empty cottage on the estate, but you would probably have to pay costs. Your employer, through his wife as agent, appears to have misrepresented the size of the property, but it would probably be a case of your word against the lady's. If the judge was satisfied that the evidence of the latter was untrue, he would have power to award you damages, probably being the cost to which you have been put in moving to the cottage and moving out again, together with any incidental expenses; but the burden of proving the misrepresentation would be on you, and if the judge had any doubt as to whose version was the more correct, he would be obliged to give the employer (as defendant to your claim) the benefit of the doubt.

GARDENERS' UNION: *Wild Rose.* The British Gardeners' Association has been amalgamated with the National Union of Agricultural Workers, 72, Acton Street, W.C.1. We understand there is still a section dealing with horticultural matters.

GOOSEBERRIES FAILING: *J. E.* No fungus disease could be found on the Gooseberry branch, but there was some indication of an attack of Gooseberry red spider. The growth had a very sickly appearance, which may possibly be due to drought and a general reduction of the vitality of the plant as a result of heavy cropping of recent years.

GRAPES AND OTHER INDOOR FRUITS FOR A LARGE INSTITUTION: *J. L. G.* A good selection of Grapes for your requirements would be Black Hamburgh, Madresfield Court and Muscat of Alexandria, with one or two vines of Buckland Sweetwater. Gros Colman, Lady Downes and Muscat of Alexandria would be suitable for planting in the late vineries. Lady Hutt variety does not do well in many gardens. With regard to Peaches, we advise you to plant one tree of Duke of York or James Walker, with Peregrine, Diamond, Bellegarde and Princess of Wales. Plant Nectarines, Early Rivers, Lord Napier, Pitmaston Orange, and either Humboldt or Pine-apple, you will not require both. Cut the turf and stack it, dusting quicklime freely between each layer to clear it of wireworms, etc. Only partially make the border the first year, and see that the compost is made firm, and allow for it settling. Raise your vines from eyes, and place them in pots or collapsible boxes when they are about 3 inches high, to prevent damaging the roots in transplanting. Plant them in the vinery in April after the border has become well warmed. Stop very few laterals the first year, and water the roots carefully and regularly to encourage them to develop. Shorten the rods to two or three eyes at pruning time to build up strong canes that will fruit satisfactorily.

LARGE PEACH: *G. M.* Your fruit of Condor weighing 12½ oz. is certainly a remarkable specimen, but it is by no means a record weight for a Peach. Mr. Godman, of Maidstone, gathered a fruit of Dr. Hogg variety in 1880, weighing 23¾ oz., and the next heaviest weight of which we have record is a fruit of Salwey grown by Mr. G. Brown, of Brownsea Island, Pool, weighing 17¾ oz.

PEACH AND NECTARINE FRUITS FALLING: *W. H. B.* We believe the falling of the fruits is due to lack of moisture at the roots of the trees; probably the borders were insufficiently moist during the late autumn of last year. Every care should be taken to test the soil in which fruit trees are growing at intervals, as only in this way can it be determined whether water is necessary or not.

PELARGONIUM ROSSWAY CRIMSON: *O. H.* We congratulate you on the excellent cultivation exhibited by the enormous trusses and fine blooms of Pelargonium Rossway Crimson received a few days ago. The variety is certainly strong-growing and free-flowering, and its brilliant crimson-scarlet colouring should make it effective as a bedding variety or for cultivation in pots.

REMARKS.—After a period of activity, with an almost daily advance in prices, the market is experiencing a set-back in most sections, with falling values. Tomatos are a notable example, the reaction being particularly acute. Trade in choice fruits, such as Grapes, Peaches, Melons, Nectarines and Figs, is feeling the effect of the ending of the London season, and the demand is quieter. The values of English Cherries have been fairly steady, except at the end of the week, when prices were lower. At the time of writing there has been a sharp recovery, and prospects are good. Gooseberries have been more plentiful; while dessert varieties of the higher grade have sold fairly well, common sorts have not been wanted. Black Currants also are quoted lower. English Apples have made their appearance, and have sold well. Mushrooms have fluctuated in value considerably, and prices are now back to normal. Outdoor Beans from the West of England have reduced the prices of forced Beans. Cucumbes in firm, green condition have sold well at high prices, but those of inferior quality are difficult to sell.

CUT FLOWERS.

REMARKS.—The supplies in this department are still very large, and those of many subjects greatly exceed the demand. Carnations are arriving in a very bad condition, the majority of the blooms showing signs of the petals curling immediately they are unpacked for sale. Many Roses are arriving full blown and unsuitable for re-dispatch. There is no great demand for any particular subject. Since last Saturday morning the supplies of Lilium longiflorum have been soon cleared, and this morning prices were advancing owing to the much shorter supply. The pink and white forms of L. lancifolium are in excellent condition and moderate in price. Large-flowered Gladioli are very attractive; there are small consignments of these flowers from Holland, including The Bride variety. The most prominent sorts from some growers are Hally, Prince of Wales, and Giant White, which is very useful for decorative purposes. Statice is arriving in much larger quantities, including S. latifolia, S. incana, S. sinuata, in mauve, white and yellow sorts, also a few bunches of the pink variety. Lavender has appeared in the market quickly, and is in excellent condition.

GARDENING APPOINTMENT.

Mr. G. Lammas, previously for four years Inside Foreman at Aston Clinton Park, Aylesbury, Buckinghamshire, as Gardener to Mrs. MELVILLE, Stratton House, Cirencester, Gloucestershire. (Thanks for 2s. 6d. for R.G.O.F. BOX.—EDS.)

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.3°.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, August 1. 10 a.m.: Bar., 29.8; temp. 73°. Weather bright.

The Hardy Fruit Crops. It will occasion no surprise to gardeners to learn that the hardy fruit crops of 1923 are amongst the worst on record, and that the failure is general in all parts of Great Britain and Ireland, and even in such favoured districts as the Channel Islands. The causes leading up to the failure are many and varied, and there is no doubt that the tropical summer of 1921 is in part responsible, for it resulted in the formation of flower and fruit buds so extensively in the autumn of that year that last season many plants exhausted their energies in fruiting abundantly and many of the blossoms that developed this spring were so weak as to be incapable of developing fruit. Added to this was the miserably cold autumn in 1922, when the wood of fruit trees failed to ripen satisfactorily, and to this cause, rather than to any other, is due the abnormal scarcity of Pears this season, for hardly any fruit buds formed on Pear trees. Most other fruit trees seemed to develop the usual amount of blossom, but observers in different parts of the country report that the blossom was, in many cases, weak. The winter of 1922-23 was exceptionally mild, and frost of any great intensity was registered only on very rare occasions. Vegetation of all kinds was exceptionally forward in the spring of this year and the period of blossoming was very early, so that when the weather turned very hot, in the early part of May, Plum trees, which are amongst the earliest to flower, suddenly became covered with white, and the blossoms of other trees, including Pears and Apples, developed rapidly. The whole of the week ending May 5 was oppressively hot, and Sunday, the 6th, was very warm, but on Monday, the 7th, the conditions changed entirely, causing people to shiver with the cold. On that and the following day, frost was reported in various parts of the country and great fears were entertained that the Plum blossom, which was well advanced, would suffer severely. Happily, the condition of the atmosphere was dry and much of the Plum blossom escaped, although the flowers of Gooseberries and other small fruits were much injured. The cold weather continued, but Apple blossom, which had received such an impetus from the sunny weather of the previous few weeks, continued to develop, and Apple orchards everywhere presented a beautiful spectacle. Other fruit trees, including Peaches, Nectarines and Apricots also flowered satisfactorily, but there was over the whole of the country a scarcity of Pear bloom, such as the oldest gardener had never remembered and the Pear crop is one of the poorest ever known; indeed, in some parts of the country Pear trees are fruitless. The cold, wet weather that succeeded the outburst of summer in May was accompanied by north winds and in some districts in Scotland frost was experienced on twenty nights; the unfavourable conditions continued until the end of June. After a brave attempt at fruiting, Plums found the conditions too much for them, and the fruits dropped wholesale, whilst the trees became a prey to insect pests of all kinds, and especially aphis. Aphis infestation everywhere was the most disastrous within the memory of gardeners and the use of insecticides seemed of no avail, for as fast as the insects were destroyed others appeared in their places. It would be interesting to learn the experiences of readers in combating this plague of aphides, i.e., whether nicotine in solution is the best specific, or whether, as some claim, Quassia extract is best; this cheap and old-fashioned insecticide seems to have been discarded by many in favour of proprietary washes, but not a few growers consider it as efficient as any in the destruction of aphis. Blight and cold weather caused the leaves of fruit trees to become stunted and curled, and much of the foliage dropped, giving the trees such a severe check that they were unable to retain their fruit, which strewed the ground beneath them. In their debilitated condition, other pests attacked the trees, and American blight on Apples and leaf blister on Peaches, to mention only two, were very prevalent. There were thus no mitigating circumstances for the trees which, after experiencing such untoward conditions in spring, were further subjected to drought of great intensity in June. From this cause, the Strawberry crop was largely reduced, for after the first blossoms had been ruined by frost the berries that did form were small, owing to the absence of rain. Not for many years was June so miserably cold and dull, there being many days when the temperature did not rise much above 50°, so that many despaired of there being any summer at all; when, in the latter part of the month, the weather became more favourable, the damage was already complete and the result is one of the worst fruit years on record. Taking the six years 1918-1923, there have been three very bad fruit seasons, those of 1918, 1920 and 1923, and three good years, 1919, 1921 and 1922. Of the three bad years, 1923 is easily the worst, even more so than 1918, which many old gardeners declared to be the worst within their experience. Of the whole of the crops this year, the smallest is the Pear crop, for out of 181 returns, no fewer than 176 record a yield below the normal, while in only five instances, two of which are in Scotland, is the crop of Pears equal to the average, and every grower in England reports an under crop. Plums are not much better, for of 132 returns from English growers, there is a deficiency in 122 gardens and, taking the whole of the returns for Plums, there are no fewer than 165 under crops, 18 of average quantity and not one exceeds the normal. Apples, which constitute the most important of all the hardy fruit crops, are a little better with 41 crops of average yield, and seven of more than average yield, out of 183 returns. Cherries have been moderately good and many growers have satisfactory crops of Peaches and Nectarines, but Apricots are almost as disappointing as Plums. The best of all crops are those of small fruits, which include such kinds as Gooseberries, Currants and Raspberries, and these, together with Loganberries, are the most consistent in cropping of all hardy fruits. Of 184 returns in this section there are satisfactory crops in 119 cases, whilst the number of crops of more than average yield, namely 35, exceeds the number of crops below the average, which comes to 30. The yield of Nuts, which are not so generally grown as the other subjects, is much below the normal, following the bumper season of 1922, when the harvest was one of the most satisfactory of recent years.

Next R.H.S. Meeting.—The transport difficulties inseparable from a Bank Holiday have induced the Council of the Royal Horticultural Society to hold its next meeting on Wednesday, August 8, instead of on Tuesday, August 7. This alteration will give exhibitors a better opportunity of conveying their plants and flowers to Westminster than would be possible if the usual Tuesday meeting had been arranged.

King's Walden Bury Gardens.—On the occasion of the King's Walden Bury Flower Show on August 8, the King's Walden Bury pleasure grounds will again be open to visitors, by kind permission of Major F. J. Harrison. A year ago a similar privilege was granted, and many people came from long distances to inspect the grounds. For the convenience of visitors, special omnibus services will run to King's Walden Bury hourly, from Hitchin and Luton, on August 8.

New President of the Chamber of Horticulture.—Mr. H. O. Larsen, who was elected President of the Chamber of Horticulture at the annual general meeting, has notified the Council that, for reasons of health, he is unable to undertake the duties of that office. At the recent meeting of the Council Mr. Larsen's decision was accepted with regret, and on the motion of Mr. G. W. Leak and Mr. G. Monro, Mr. John Harrison, junr., of Leicester, was unanimously elected President for the ensuing year. Mr. Harrison took up his duties immediately.

Sweet Pea Trials at Reading.—The Sweet Pea Trials conducted by Mr. Cobb at the University College Gardens, Reading, on behalf of the National Sweet Pea Society, are now open to inspection by members of the N.S.P.S.

Examination for the National Diploma in Horticulture.—The Royal Horticultural Society's National Diploma in Horticulture has been awarded to the following as a result of the written and practical examinations held this season. Section 1: General Horticulture:—Henry Fraser, 21, Victoria Crescent, Chelmsford; F. J. Fanner, Drayton Manor, Chichester, Sussex; Miss V. G. Hartley, Hockerill Training College, Bishop's Stortford; and Ivan A. T. Dowding, 20, Rising Brook, Stafford. Section 2: Hardy Fruit Growing:—William E. Cole, Dyrham, Staple Hill, Bristol. Section 3: Market Gardening; Under Glass:—Wilfred G. Ayres, 3, Anton Lane, Enham Village Centre, Andover; Albert J. Purser, 1, Hewlett Place, Cheltenham; and J. R. Lewis, 130, Church Road, Burgess Hill. Section 3: Market Gardening; Outdoors:—J. S. Mitchell, 49, Belvedere Road, Bexley Heath, Kent. Section 8: Horticultural Teaching:—

Digitized by Google

J. R. Lewis, 130, Church Road, Burgess Hill; and Ivan A. T. Dowding, 20, Rising Brook, Stafford. The following have also passed the Preliminary Examination and will be eligible to take the Final Examination when they have completed the necessary six years of practical experience in gardening:—Ira Treseder, 4, The Avenue, Truro, Cornwall; Miss G. Henderson, The Training College, Darlington; E. Fenswood Barker, Long Ashton, Bristol; Miss E. Eagle-Bott, 12, Pine Avenue, W. Southbourne, Bournemouth; Miss A. M. Dunnant, Club House, Middleton-by-Youlgrave, Bakewell; Charles P. Barrett, 24, Granville Road, Bournemouth East; G. H. Nash, The University, Leeds; Miss R. Collett, The Laurels, Gt. Shelford, Cambridgeshire; A. D. Blaxill, Hillsborough, Inglis Road, Colchester; Jesse Amos, High Street, East Malling, Kent; Miss Lloyd Jones, Glyn-Cerrig, Mumbles, S. Wales; Miss N. Youatt, St. Andrew's Hall, Reading; Miss A. Hodgkinson, Rose Hill, Penistone, Yorks; C. R. S. Gregory, 34, Leabourne Road, N.16; Arthur W. Witt, Broomfield, Offham Road, West Malling; Percy Clare, 62, Lindum Avenue, Lincoln; T. F. Lloyd, 28, Rostherne Avenue, Fallowfield, Manchester; Gilbert Oule, 46, Wellington Street, Moss Side, Manchester; Miss G. Pollard, St. Leonard's House, Park Road, Edinburgh; H. D. Bennett, Wantage Hall, Reading; Stewart D. Read, 49, Burlington Avenue, Kew; James Pirie, 11, Watcombe Cottages, Kew; A. S. Thomas, Wantage Hall, Reading; Miss C. M. Christy, 51, Broomfield Road, Chelmsford; Miss J. Macdonald, The Haven, Inverness; and Miss R. Leir, Aldersey Horticultural College, Chester.

£15,000 Donation to Imperial College of Science.—It is with pleasure that we are able to record an offer by the Clothworkers' Company of the City of London of an annual contribution of £3,000 for the period of five years, 1923-1927, to the Governing Body of the Imperial College of Science and Technology, South Kensington, to be applied towards the maintenance and development of the City and Guilds (Engineering) College, one of the three constituents of the Imperial College of Science. This donation is supplemental to the sum voted some years ago by the Goldsmiths' Company, a gift amounting to £85,000, which enabled the Engineering College to extend its premises, and is quite distinct from the annual vote of £5,000 from the City and Guilds of London Institute which has been paid to the Imperial College since the Charter was granted some fifteen years ago and applied to the City and Guilds (Engineering) College. It is another indication of the value which practical men in the City of London attach to the research and general teaching in science in relation to industry.

Swanley Horticultural College.—Kathleen, Viscountess Falmouth, presided at the Swanley Horticultural College Speech Day, on Wednesday, July 22, when Lord Lambourne presented the diplomas and certificates to successful students. Dr. Barratt, the Principal, stated that the number of students this year was seventy-three. All who had wished for posts had been successfully placed. Lord Lambourne said the syllabus of the college was one of the best he had seen. He was glad that they were starting a rock garden. Rock gardens were very beautiful if properly conducted, but one of the ugliest things he knew was a rock garden not properly constructed or cared for. Princess Mary, Viscountess Lascelles, visited the College on Tuesday, and expressed great satisfaction at the excellence of the work.

Birmingham Chrysanthemum Show.—An attractive schedule of one hundred and thirty-four classes has been provided by the Committee of the Birmingham Chrysanthemum Society for the exhibition to be held in Bingley Hall on Tuesday, Wednesday and Thursday, November 6, 7 and 8 next. Liberal prizes are offered for thirty-six Japanese blooms, together with a handsome Silver Challenge Shield. Two group classes are provided, and there are classes for plants in addition to many for cut blooms, these latter being divided among all comers, amateurs and local exhibitors. Other classes are for winter flowering plants of various kinds, for Apples, Pears and vegetables. The Secretary is Mr. A. Noakes, 148, Bristol Street, Birmingham.

Mr. W. H. Johns.—The recently appointed superintendent of the Gardens and Open Spaces Department under the Metropolitan Borough of Bermondsey, Mr. W. H. Johns, has had a varied and practical experience in horticulture. He first served under his father in the late Mrs. Bickford's garden at Camborne, Cornwall, and then secured employment in the Rose department at Messrs. Low and Co.'s nursery, Enfield. He entered service at Kew in 1907, and during two years spent in the Royal Gardens he became a sub-foreman, and was also successful in winning first prize for a garden design sent to the Letchworth Garden Design Competition. From Kew Mr. Johns went to Kilmarnock to fulfil an appointment as Horticultural Instructor to the Academy and Technical Schools. In 1912 he was appointed Horticultural Instructor to the Municipal Technical Institute and County Borough of Belfast. Here he remained nearly four years and organised schemes of instruction for professional and amateur gardeners, for

MR. W. H. JOHNS.

allotment holders and teachers. He also surveyed and planned out large areas for allotments, and under his supervision allotment gardens increased from 300 in 1912 to 3,000 in 1916. While at Belfast he was appointed Inspector of Plant Diseases for the Belfast area and was elected President of the Belfast Nature Study Association. His next appointment was as Staff Instructor to the Irish School of Gardening for Women and special lecturer to the Alexandra College, Dublin, and to the Rathmines Technical Institute. While at Dublin he conducted teachers' classes in rural science and school gardening for the Irish Department of Agriculture and Technical Instruction. From Dublin Mr. Johns passed on to Kilkenny and Waterford, where he acted as instructor for teachers' classes and to allotment holders, and in April, 1920, he was appointed Horticultural Superintendent to the Cornwall County Council Education Committee. In Cornwall he organised schemes of horticultural instruction and carried out numerous trials of Potatos, Broccoli, and other crops of special value in the favoured Duchy. He also commenced experiments with a view to the improvement of the strains of Broccoli suitable for market garden crops in Cornwall. After excellent work in this connection he obtained the appointment of Superintendent of the Parks and Gardens at Bermondsey. Mr. Johns holds the N. D. Hort. degree in general horticulture and horticultural teaching, and has obtained teacher's certificates in art and nature study. He also holds the Board of Education certificates in botany, chemistry, physics, physiology, mathematics, and drawing. Besides being a most capable organiser, he is also an attractive lecturer, and has contributed articles on gardening subjects to numerous publications.

The Genus Eucalyptus.—In Part 10, Vol. VI. (Part LX. of the complete work) of *A Critical Revision of the Genus Eucalyptus*, Mr. J. H. Maiden discusses the value of the fruits as a means of classifying the members of this extensive genus, and groups the species in accordance with the shape of the fruits and the form of the valves. The four plates are used to illustrate the different forms of leaves and of venation, and are additional to the full text and illustration on these subjects given in part LVII., issued in January, 1923.

Appointments for the Ensuing Week.—Sunday, August 5.—Wakefield Tulip Society's meeting. Monday, August 6.—Seaham Harbour Horticultural Society's show; Warwick Horticultural Society's show; Heathfield and District Horticultural Society's show; Chippenham Horticultural Society's show; Marlow Horticultural Society's show; Rutland Horticultural Society's show; Leagrave, Limbury and District Horticultural Society's show. Tuesday, August 7.—Northampton Municipal Horticultural Society's show in Abington Park (two days); Leicester Abbey Park flower show (two days); Walsall Floral Fête (two days); Sevenoaks Gardeners' Chrysanthemum Society's meeting; Royal Caledonian Horticultural Society's meeting. Wednesday, August 8.—Royal Horticultural Society's Committees meet; Kingsclere and District Horticultural Society's show; Sheffield Chrysanthemum Society's meeting; Morley and District Paxton Society's meeting. Thursday, August 9.—Taunton Dene Horticultural Society's show; Swanage Horticultural Society's show; Market Bosworth Horticultural Society's show; London and North Western Railway Horticultural Society's shows at Cheshire and Yorkshire. Friday, August 10.—Brechin Flower Show. Saturday, August 11.—Stonehaven Flower Show; North of England Pansy and Viola Society's show in conjunction with the Nelson Small Holders' Society's show at Nelson; Aberdour Flower Show; Auchencrow (Berwickshire) Flower Show; Dysart Flower Show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Transplanting Evergreens.* The following extract from Downing's book may be interesting to some of your readers:—"Another mode of transplanting large Evergreens, which is very successfully practised among us, is that of removing them with frozen balls of earth in mid-winter. The trees to be removed are selected, the situations chosen, and the holes dug while the ground is yet open in autumn. When the ground is somewhat frozen, the operator proceeds to dig a trench around the tree at some distance, gradually undermining it, and leaving all the principal mass of roots embodied in the ball of earth. The whole ball is then left to freeze thoroughly (generally till snow covers the ground), when a large *sled*, drawn by oxen, is brought as near as possible, the ball of earth containing the tree rolled upon it, and the whole is easily transported to the hole previously prepared, where it is placed in the proper position; and as soon as the weather becomes mild, the earth is properly filled in around the ball. A tree, either evergreen or deciduous, may be transplanted in this way, so as scarcely to show at the return of growth any ill-effects from its change of location."—*Hortulanus.* (This is the best of all the modes of removing Trees, but it is difficult and costly, on account of the weight to be dealt with.) *Gard. Chron., July* 29, 1848.

Publications Received.—*Variety in the Little Garden.* By Mrs. Francis King. The Atlantic Monthly Press, Inc., 8, Arlington Street, Boston. *Annuaire du Fleuriste.* Obtainable from E. Bocion, 2, Rue Paganini, Nice. Price, 20 francs.

INDOOR PLANTS.

CALLICARPA PURPUREA.

Some of the plants that found favour with gardeners twenty to thirty years ago are, at the present day, either almost lost to cultivation or forgotten. Amongst their number is Callicarpa purpurea. This is a very attractive plant for the decoration of the greenhouse or conservatory during the winter, and a great acquisition for grouping amongst a miscellaneous collection of plants.

The beauty of the plant lies in its fruit rather than in its flowers, and when grown as standards with its long, arching shoots covered with small clusters of bright purple berries it is most effective, and the berries hang for a very long time on the plant.

This Callicarpa is a good plant for hanging baskets in a conservatory, and three or four young specimens in berry should be placed in a basket and suspended from the roof rafters. It is of easy culture, and the aim of the grower should be to procure long shoots, with clusters of purple berries in the axils of each leaf, clothing the stems nearly their full length.

Mr. Latham, when Curator of the Birmingham Botanic Gardens, grew this plant most successfully. His plants were grown as standards on stems about 4 feet high, and had shoots about 2½ feet to 3 feet long that dropped slightly, the whole plant being similar in shape to an open umbrella.

Stock of this Callicarpa may be increased by means of seed sown in pots and pans in spring and germinated in a warm temperature. Cuttings from cut-back plants root readily, or half-ripened shoots may be placed in moist, bottom heat under a hand-light or frame. The cuttings may be rooted singly in small pots, or several may be inserted in a 3-inch or 4-inch pot. When rooted the cuttings should be transferred to larger pots and placed in a temperature of about 60° to 65°. When they commence to make good growth, and three or four shoots are required, the leading shoots should be pinched out once or twice to encourage the development of more shoots.

Before the plants are finally potted into the 6-inch or 8-inch pots, in which they will flower in July or August, in time for them to set their berries, they should be grown on in an intermediate house or warm greenhouse in a moist, growing atmosphere, and shaded from the direct rays of the sun. A little air should be admitted when the weather permits of ventilating, but the plants should not be exposed to cold draughts.

Be careful not to syringe the plants when they are in flower, otherwise the berries will not set. After the berries have set, and the pots are full of roots, give the latter liquid manure once or twice a week.

For training as standards select the strongest specimens with straight shoots, and grow them on to the height required before stopping them, similar to growing standard Fuchsias.

When the berries commence to shrivel and drop, water should be gradually withheld from the roots to allow the plant a period of rest before again starting it into growth.

In the beginning of February the shoots should be pruned to within three or four buds of their base, and the plants started again in a moderate amount of warmth. After the plants have commenced to make fresh growth, repot them, first removing the old, loose soil. Be careful not to over-pot them, and use plenty of drainage material. The soil should consist of two-thirds rich turfy loam and one-third fibrous peat or leaf-mould, with a little decayed cow manure, and silver sand added.

The winter temperature, when the plants are in fruit, should be about 50°. Should green fly appear, fumigate the plants, otherwise the young growths will become crippled and stunted, and the plants be a failure for the season.

Callicarpa purpurea was introduced from China in 1822, and belongs to the Natural Order Verbenaceae. *John Heal, V.M.H.*

THE ROSE GARDEN.

THE ROSE SEASON IN SOUTHERN SCOTLAND.

In this peninsular region, chiefly owing to the almost ideal atmospheric conditions for Roses that prevailed during July, the blooms have been fuller, and richer in colour than they have been for many years past. The most beautiful of the newer varieties I have seen this season is Leslie Pidgeon, whose colour is intensely attractive, and whose central petals are marvellously full. It is grown by my successor, the Rev. Louden MacFadden, in Kirkmaiden Manse Gardens, where I was a cultivator or Roses, oriental Lilies, and other fragrant flowers, for thirty-three years. Other varieties that have been conspicuous by reason of their size and brilliant colouring in my new borders this year are Lady Craig, W. E. Wallace and Mrs. James Williamson.

A very beautiful new variety, sent to me some months ago by Monsieur J. Pernet Ducher, of Lyons, and named after myself, is of the palest pink in colour (not unlike Duchess of Sutherland grandiflora Sweet Pea, which I greatly admire), and perfect in formation. Its predecessor was, it will be remembered, coral red in colour, shaded with carmine-lake.

The finest of Pernet Ducher's Roses are magnificently grown in Logan Gardens in this peninsular parish by that ardent horticulturist, Mr. Kenneth A. McDouall, and luxuriate there in fertile soil. Such beautiful sorts as Madame Edouard Herriot, Constance, Rayon d'Or and the Lyons Rose are invariably grandly effective.

At Lochinch Castle Gardens, also situated in this county, the finest Roses that have emanated from the great Rosariums of Waltham Cross, Newtownards, Belmont and Colchester are particularly impressive. I find that whilst cultivating a large number of varieties of recent introduction such as the brilliantly coloured Souvenir de Georges Pernet, The Queen Alexandra (which is quite vigorous in Logan Gardens, near the picturesque ruins of the ancient castle, and splendidly effective), Florence Izzard (a very beautiful hybrid Marechal Niel), W. E. Wallace, and those of some other raisers, besides those originated quite recently, such as Messrs. Dobbie's varieties and Mrs. Tom Smith, a charming native of Stranraer, I still cling fondly to some of the older Roses, such as Margaret Dickson, Ophelia, Bouquet d'Or and Madame Alfred Carriere, which still adorns the walls of my old Manse gardens, with Hugh Dickson (of Belmont) and George Dickson, contrasted in their aspect like light and shade, and brilliant "rivals in renown." Just as I have always advocated very strongly the retention of several of the grandiflora Sweet Peas by reason of their splendid fragrance and exquisitely hooded form, which is little affected by atmospheric influences, for the conservation of odour and floriferousness, so, for similar reasons, such fine Roses as I have indicated (and Frau Karl Druschki for its imperial impressiveness, though absolutely inodorous) should be retained. The grandest Rose creations, if they have not the inestimable attribute of fragrance, are like a majestic woman devoid of amiability. *David R. Williamson.*

The Week's Work.

THE FLOWER GARDEN.

By C. Turner, Gardener to Emily, Lady Ampthill, Ampthill Park, Ampthill, Bedfordshire.

Scything and Pruning.— In addition to places where the mowing machine cannot be used, such as around certain trees and on banks, there are glades and woodland paths where a general trim up with the scythe is advisable to ensure an easier foot passage, and to give an appearance of tidiness to the surroundings. Overhanging branches of trees may also be cut back or removed to allow easy passage along the walks, and any openings made to secure distant views should be kept quite clear. Encroaching shrubs should be pruned back, and straggling briars cut away. The latter sometimes spring up, from wind or bird borne seeds, among good shrubs, in which case the roots must be dug out, as cutting back the growths only induces stronger shoots to grow.

Orchis pyramidalis.—A patch of this lovely wild flower has been both interesting and attractive in the rougher parts of the pleasure ground here. It is not found in every part of the country, therefore where it does abound the growths should be allowed to fully ripen before the site is scythed over, to allow an opportunity for seeding. The latter suggestion holds good concerning any other kind of wild flower that finds a place in the woodlands and is sufficiently appreciated.

Chrysanthemums.—The dry weather and intense heat has caused some of the border varieties to show buds unusually early. This will mean earlier attention to the thinning of the flower buds of those sorts which produce flowers too closely together; if the ground is poor a top-dressing of old, decayed manure will be beneficial. If not already done staking and tying will be necessary, at least with most varieties, and a continued dry period will necessitate much watering.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to J. A. Berners, Esq., Woolverstone Park Gardens, Ipswich.

Melons.—If fruits are desired late in the autumn now is the time to set out the plants. For such a crop a suitable house, with both top and bottom heat at command, is essential to secure the best results. The bed of fermenting material should be carefully prepared, also the soil. The soil should be on the heavy side, with a liberal addition of broken mortar or old plaster and wood-ash to render it porous; a good sprinkling of bone-meal thoroughly incorporated with the soil will be beneficial. When the Melons are planted keep the house closed, and, if necessary, lightly shade the plants for a few days until the roots begin to permeate the soil. Force the plants along with a high day temperature, closing the house early in the afternoon to maintain a temperature of 85° to 90°, but in the evening allow a fall to 65° or 70°, and keep this temperature steady during the night. As growth progresses keep all superfluous lateral growths closely pinched or rubbed off, and train the main growths thinly; by so doing the foliage will be of good substance, which is so essential to the health of the plant. Maintain a humid atmosphere in the house, and thoroughly syringe the plants twice a day to prevent red spider from gaining a foothold.

Ripening Melons.—Plants on which Melon fruits have commenced colouring should be afforded more air, with a drier atmosphere; cut the fruits before they break away from the stems. Certain varieties break away more readily than others and their fruits need to be cut on the first signs of cracking around the stem.

PLANTS UNDER GLASS.

By John Coutts, Assistant Curator, Royal Botanic Gardens, Kew.

Ixias, Sparaxis and Babanias.—All these South African bulbous plants used to be grown freely in gardens, but are seldom seen now. This is rather surprising when one considers how easy is their cultivation. Ixias at least are delightful subjects for the supply of cut flowers. September is early enough to pot them up, and in the initial stages they may be grown in cold frames, removing them to a cool airy greenhouse as they approach the flowering stage. Tritonia crocata and its varieties should be grown in the same way; they flower with wonderful freedom, and last in good condition for a long time in the cool greenhouse; they are also very useful when cut, making charming subjects for table decoration.

Kalanchoe flammea.—This Kalanchoe is also very useful for greenhouse decoration, and is easily propagated by means of cuttings inserted at this time. Plants that have finished flowering usually produce plenty of growths at their base suitable for use as cuttings; being of a fleshy character, they root readily on an open bench in a cool greenhouse. During the winter they are best grown in a warm, airy greenhouse, and should be kept somewhat on the dry side during that period.

Kalanchoe Dyeri.—This Kalanchoe and the hybrid K. kewensis are also very useful for conservatory decoration. They are larger growing plants than K. flammea, well grown specimens attaining a height of 4 to 5 feet. They are both easily propagated by means of cuttings inserted at this time, and succeed under the same cultural conditions as K. flammea.

THE KITCHEN GARDEN.

By R. W. Thatcher, Gardener to Mark Firth, Esq., Carlton Park, Market Harborough, Leicestershire.

Cucumbers.—Plants growing in houses will not give much trouble now except in keeping the old leaves cut out and the growths thinned. Water the roots occasionally with liquid manure or an approved fertiliser in solution, and top dress the beds with rich soil as the roots show on the surface. Any plants that are exhausted should be cleared out of the house and the latter cleansed. Sow a few seeds to obtain plants for autumn fruiting, and place the seed-pan in the propagating pit, in which the seeds will soon germinate. In the meantime, make up a fresh bed of fermenting materials, and place some rich soil on the dung when it has settled down. As soon as the young plants have made two rough leaves, plant them out as advised for the previous crop, and treat the plants in the same way. Take advantage of the sun's warmth by closing the house early after syringing the plants overhead, and thoroughly damping the floors and walls. Shade the plants from very strong sunshine, but do not overdo this, especially in the afternoons. Cucumbers in frames require much the same treatment; the growths should be regulated and the plants kept well supplied with water.

Leeks.—Plants raised from an outdoor sowing in April or May will now be large enough for planting. Select an open site, and make holes about a foot or 15 inches deep with an iron bar, and drop one plant in each hole. As each row is finished afford water, but leave the holes open. As the plants grow, they may be earthed up once or twice. This crop will stand all through the winter, and prove most useful in the spring, when the earlier-sown Leeks in trenches are over. These latter, by the way, should be earthed up as necessary and the roots should be liberally supplied with water.

Cauliflowers.—These should now be providing plenty of good heads. The bed should be inspected daily, and some of the leaves turned down over the curds to protect them from the sun. Keep a look-out for caterpillars, especially if there is rain, and hand pick them. In the event of dry weather afford this crop good soakings of water now and then, and, better still, diluted liquid manure if this is obtainable.

HARDY FRUIT GARDEN.

By A. J. Hartless, Gardener to Major J. F. Harrison, King's Walden Bury, Hitchin, Hertfordshire.

Summer Pruning.—This operation should be continued, but shoots that may be desirable for the proper formation of the tree should be retained. Clean cuts are essential, and should be made with the view to avoiding further cutting in winter. Cordon trees should be dealt with first, as these will be somewhat crowded with growth, thus preventing the fruit from receiving sufficient air and light. The extension system, or the introduction of young wood to replace the old stems, is generally practised now, and has much to recommend it. It must be recognised that the continual hardening of the tissue as the tree grows older, whether it is an Apple or a Vine, must tend to restrict the flow of sap and thus decrease the size of the fruit.

Strawberries.—The layering of Strawberries will now have been completed. The first batch should be removed as soon as rooted to a place where the plants may receive proper attention. Remove the straw and the older and decayed leaves from the parent plants and hoe the surface of the bed. Auxiliary plants placed in the rows last season, between the permanent plants, should now be cut out with the hoe. After hoeing, the bed may be dressed with some good fertiliser. The plants should be encouraged in every way to make good stools, and should not suffer from lack of moisture.

Various.—Apples continue to fall, and it is difficult to state whether the cause is to be attributed to the reaction caused by rains following dry conditions, or to the extreme heat experienced recently. There was a good crop in the continuously dry year of 1921, therefore alternative extremes of temperature may have something to do with the present partial failure. Pots of hay or hollow Bean and Delphiniums stems should be placed among the growths of Peach and Nectarine trees to trap earwigs before the fruits are attacked.

THE ORCHID HOUSES.

By J. T. Barker, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

Seedling Cypripediums.—The present is a suitable time to examine seedling Cypripediums to ascertain which need larger receptacles. The compost will usually be found to be in good condition, and, in most instances, the plants may be transferred to larger pots without much disturbance. The roots should be disentangled and placed carefully in a pot some two sizes larger, and the pot should be well drained. A compost of peat fibre and Sphagnum moss cut into moderately fine pieces provides a suitable rooting medium for these small plants, and it should be pressed moderately firmly in the receptacles. Over-potting the plants should be carefully guarded against, as they are not capable of extending their roots through a large amount of compost. Plants that are nearing the flowering stage may be left until the spring, unless there is a danger of them suffering from starvation, when they will be the better for a supply of new material. Smaller seedlings, in store pots, may be potted singly; we use pots of 1 inch in diameter and a compost consisting of peat fibre and moss cut up finely. Seedlings which are now showing on the seed beds, raised from seed sown in the spring, are large enough to handle, and should be pricked off into store pots, in which they should remain until they are large enough to be transferred to larger receptacles. Every assistance should be given these small plants to enable them to make rapid growth and reach the flowering period in the shortest time possible, for if they once receive a check their progress will be slow. They should be grown in a brisk temperature and humid atmosphere, and kept rather heavily shaded. Thrips are troublesome pests, and if allowed to infest the plants will soon ruin them. Directly any of these pests are detected, the house should be fumigated at once, and in hot weather it is advisable to fumigate all the houses once or twice at intervals of one or two nights.

PUBLIC PARKS AND GARDENS.

Sir James Calder, who was for some time a member of Bo'ness Town Council, recently offered to present Bo'ness with a park of six acres situated in the mining district of Castleloan. The condition attached to the gift was that Sunday games must be allowed on the grounds. There was strong local opposition to this stipulation, and a poll of the electors was taken on the question, with the result that the proposal to allow Sunday games was rejected by an eight to one majority. Only 24 per cent. of the electors polled, and a 50 per cent. vote was necessary to decide the matter. Subsequently Sir James expressed his intention of presenting the park without imposing this condition.

On the 19th ult., two valuable additions were made to the open spaces of Liverpool, consisting of a charming piece of woodland and lake at Larkhill and the more imposing Camphill estate at Woolton. Camphill estate was presented to the Corporation of Liverpool by the late Mr. Chas. Williamson, and it was fitting that Lady Royden (formerly Mrs. C. Williamson) should have been asked to open the new park to the public. At the opening ceremony hope was expressed that the Camphill estate and Woolton Wood would eventually form one park, and Mr. Rankin, chairman of the Housing Committee, said that his committee wished to hand over to the Parks and Garden Committee of Liverpool a strip of land on each side of Tue Brook, from the Clubmoor Recreation Ground to the proposed new Walton Park. This strip would consist of land fifty to sixty yards deep on each side of the stream, and thus provide ample space for bowling greens and tennis courts over a length of about one-and-a-half mile. Needless to say, Mr. Rankin's proposal was received with enthusiasm, and will be considered by the Liverpool Parks and Gardens Committee at an early date.

NOTICES OF BOOKS.

Delphiniums.

The popularity of Delphiniums and their value for garden decoration is so obvious that Mr. A. J. Macself has no need to apologise for his neat little booklet* dealing with these splendid flowers. No one is likely to quarrel with the author in regard to his advice as to cultivation, and those who desire to excel with Delphiniums as exhibition flowers will welcome his detailed account of the methods to be followed for the purpose of securing first prize. But not all will accept his statement that "blue is the rarest colour in Flora's kingdom." Mr. Macself rightly places emphasis upon the desirability of growing the finer varieties instead of older and less beautiful ones, although he is careful to point out that for "many decorative schemes the light and airy flowers on slender stems are superior to the heavier flowers."

The author expresses his belief that autumn planting has killed more Delphiniums than any disease, and considers that planting should be finished before the first week of October is over. Propagation is dealt with at some length, and quite clearly, but Mr. Macself makes no reference to propagation by means of cuttings of basal growths in July, nor does he mention the method of layering which, we believe, certain growers follow with considerable success. The booklet is pleasantly written, and should prove useful to all who are interested in the cultivation of one of the most beautiful races of garden plants. A reference, made at the end of the booklet, to the Delphinium as a pot plant is timely, because the unheated greenhouse in which plants may be flowered in spring is becoming increasingly popular.

* *Delphiniums and How to Excel with Them.* By A. J. Macself. Country Life, Ltd., 20, Tavistock Street, W.C.2. Price 9d. net.

ORCHID NOTES AND GLEANINGS.

CATTLEYA GLADIATOR.

This bright and richly-coloured hybrid derived from Cattleya Gladys (Atalanta × Dowiana) again crossed with C. Dowiana aurea, gives a fine example of progressive hybridisation, the form of C. Gladys used having been raised by Messrs. J. and A. McBean, Cooksbridge, the senders of the present novelty. The influence of C. Leopoldii in C. Atalanta is seen in the firm texture of the flower and in the marking of the lip, but the form of C. Dowiana is maintained. The sepals are tinged and veined with vinous purple and the petals are bright mauve with dark purple veining. The crimped lip is purple, shaded with red, and with distinct gold lines from the base to the yellow disc which extends over the side lobes.

LAELIO-CATTLEYA BIDDY.

C. J. Lucas, Esq., Warnham Court, Horsham (gardener, Mr. Duncan) sends the first flower of a very attractive cross between Cattleya Iris (bicolor × Dowiana aurea) and Laelio-Cattleya Wellsiana (C. Trianae × L. purpurata). In form it resembles Laelio-Cattleya Wellsiana, the constriction in the middle of the lip often seen in C. Iris hybrids, and acquired from C. bicolor, not appearing. The sepals and petals are of that clear white which is often seen in Laelio-Cattleyas of C. Dowiana ancestry. The front and broad margins of the side lobes of the lip are bright purplish-violet, the base being primrose-yellow with faint mauve lines on the inside and white on the exterior. It is a good addition to the favourite class which includes L.-C. Canhamiana and L.-C. Aphrodite, but other plants of the same small batch will probably show more of the C. Iris parent.

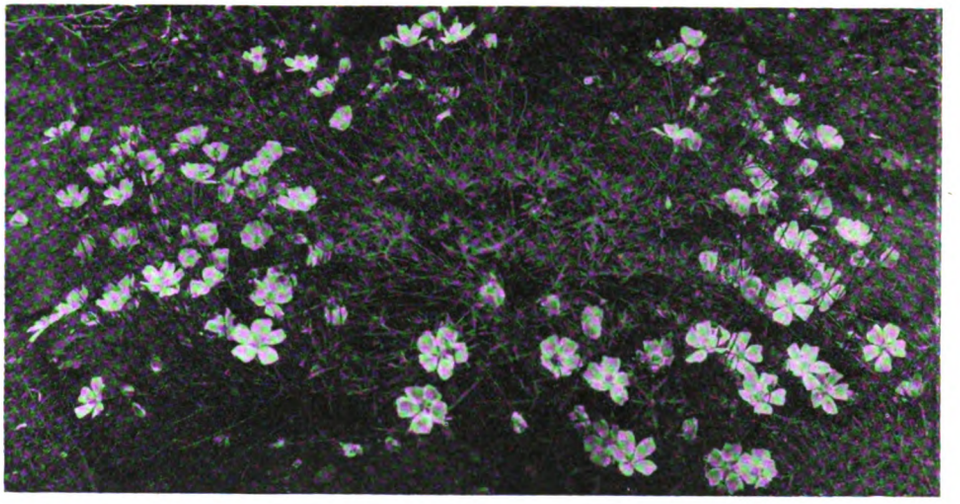

FIG. 26.—CALLIRRHOE LINEARILOBA.

HARDY FLOWER BORDER.

HELENIUMS.

The Heleniums comprise a very useful genus of hardy perennials belonging to the Natural Order Compositeae, and are known under the popular names of Helenflower, Sneezewort and Sneezeweed. Several of the named varieties of Helenium are fine border flowers. The one named July Sun is very attractive from June onwards, with its well-branched, stout stems bearing numerous large golden-yellow flowers with faint crimson markings. The plant is of bushy habit and grows from 2½ feet to 3 feet tall. The variety Wyndley, of recent introduction, has much larger flowers, of a rich golden yellow, prettily shot with crimson. This sort flowers from June to August, and grows to a height of 3 feet.

The compact, free flowering Helenium pumilum magnificum is perhaps the most handsome of the soft yellow-flowering varieties. It reaches a height of approximately 2½ feet to 3 feet, and produces freely branched stems of stout, erect habit, that are covered with large flowers from June to August. The variety pumilum aurantiacum is of more recent introduction, and similar in every respect to the preceding, but has large clear orange-yellow flowers which appear from June to August.

H. cupreum forms a dwarf neat plant of branching habit, and is covered with coppery-red flowers, that are faintly shot or streaked with yellow, from June to August. H. Bolanderi is one of the most distinct of the Heleniums, on account of its bold, black, central disc, which shows the bright golden-yellow flowers to advantage. The blooming season of this species is June to August. The plant grows 2 feet tall.

The Heleniums are all vigorous growing plants and quite hardy. They thrive in ordinary garden soil that has been deeply cultivated, and are well adapted for the second row in the herbaceous border or for forming groups or beds. Three to six plants growing together in the border soon form handsome clumps, and bloom over a long period, frequently until the autumnal varieties show colour. These Heleniums should be transplanted in autumn or early spring. They delight in deeply worked soil of a sunny position. *W. Logan.*

CALLIRRHOE LINEARILOBA.

Among the interesting Malvaceous plants native of North America, the Poppy Mallows, of more or less trailing character, form a group not commonly met with in gardens, but none the less showy when in flower and interesting by reason of their radiating habit. They consist of annual or perennial herbs, and are fairly easy of cultivation provided they have a sunny position and are grown in light, rich, sandy soil. The perennial species may be increased by means of seeds and from cuttings, the former sown in spring, in pans, in a cold frame, and the latter inserted in sandy soil in a cold frame.

The two species most often met with in gardens are Callirrhoë involucrata and C. linearilobа (Fig. 26). The former has purplish-lilac flowers, and the latter purplish flowers, each with a white base. Although the flowers are not long lived, they are freely produced in succession, and are very effective on a well-grown plant.

The late Mr. Reginald Farrer summarily described the Callirrhoës as "a group of trailing Mallows, of indifferently hardy temper, even in hot and sandy soils, with rapidly evanescent flowers of rather aniline tone."

The *Index Kewensis* lists seven species of Callirrhoë and makes C. palmata, Buckl., and C. verticillata, Groenl., synonymous with C. involucrata. At least one species, C. spicata, is now referred to the genus Sidalcea.

DIANTHUS ATKINSONI.

IT would be interesting to know how long ago, and by whom, that most gorgeous of all Pinks, Dianthus Atkinsoni was raised, and what was its parentage. Almost certainly the Sweet William was one parent. What can have been the other? I have known Dianthus Atkinsoni for nearly twenty years, and it has always during that time been a rare plant. It is a hybrid, and a sterile mule at that. It is never very robust, yet flowers with extra-ordinary freedom, and unless special precautions are taken it makes very little "grass," and so is not easy to increase.

About sixteen years ago I wanted Dianthus Atkinsoni and, fortunately, my then foreman, Mr. Cecil Davies, was able to help me in the matter. He told me that some years before, when he was foreman at Mr. Wood's nursery in Yorkshire, he had discovered there in a remote corner of the nursery a single plant of D. Atkinsoni; an ancient specimen with an almost woody trunk as thick as one's thumb. Mr. Davies always held that this wonderful old specimen was the last remaining one in cultivation. But however this may have been—and it is a pleasing and romantic idea—he took special pains to propagate it, and raised a small stock.

I wrote for a plant, which duly arrived at Stevenage and was reverently worshipped and propagated here. We showed specimens in London once or twice, in the old pre-war days, and the hybrid never failed to make a sensation and become hopelessly oversold. But I always jealously kept one plant back. In 1918 I found I still had a plant, old, and woody, and by no means sprightly. I took it to my own garden and there regaled it with a post-war diet of cow dung. The effect was almost magical. It sent up several strong flower stems, which were removed directly the flowers opened, and then came a splendid crop of "grass." These growths I removed "with heels," when still quite small and young, many of them not an inch long, as fast as they appeared, and had them struck in a cold frame. By the autumn we had one hundred and fifty healthy young pot plants, all from that last remaining veteran.

All this gave me the idea how best to grow Dianthus Atkinsoni. When you plant it, bury a lump of pure cow dung just under the roots. This acts both as a sponge to retain moisture, and as a stimulant.

Dianthus Atkinsoni carries broad, branching heads of rather large flowers on erect, wiry stems from 9 inches to 15 inches tall. Each flower is well over an inch across, single, with slightly fringed edges, and of the most dazzling carmine scarlet imaginable, with a central zone of almost flame red. So dazzling is the colour that one must look steadily into the flowers to distinguish the central flaming zone. At a casual glance it looks all one tone of brilliance.

The plant is perfectly hardy and perennial, yet it is so free flowering that it looks always as though it must exhaust and kill itself. Yet the old woody stock remains, and as the plant is absolutely sterile and never sets seed, it survives. I have seen seed of Dianthus Atkinsoni offered in a catalogue. It was supposed to have come from a very famous garden!

It is to be hoped that this brilliant old hybrid will never die out in English gardens. So long as cows remain to us—and a love of good plants—there is no reason why it should. Motors have made stable manure scarce, but so long as we continue to produce milk in our good old-fashioned way there should always be enough cow dung—at any rate for Dianthus Atkinsoni! *Clarence Elliott, Stevenage.*

TREES AND SHRUBS.

CLADRASTIS SINENSIS, HEMSLEY.

Since this interesting Cladrastis, the Chinese Yellow Wood, was first introduced from Western Hupeh by Mr. E. H. Wilson when collecting on behalf of Messrs. Veitch, in 1901, lovers of new and rare trees have watched its development with more than usual interest. In the first place, the foliage attracts attention, but chief interest centres in the flowers (Fig. 27), which appear during late June and July in Western Hupeh and Western Szechuan.

Mr. Wilson records the Chinese Yellow Wood as a common tree in the moist woods between 4,000 feet and 8,000 feet altitude; most of the wild trees are of medium size, up to about 50 feet, but specimens of larger dimensions also occur. It is a deciduous tree, and in habit suggests Sophora japonica, being wide-spreading and quite one of the latest trees to commence new growth in spring.

The pinnate leaves consist of nine to fifteen leaflets, alternate, 1½ inch to 3 inches long and ¾ inch to 1 inch wide, dark green and smooth above, glaucous beneath. The flowers are fragrant, blush white, ½-inch long, with a dull golden mark at the base of the standard petal, and they are freely borne in erect terminal panicles from 7 inches to 8 inches high and 5 to 6 inches wide.

When originally discovered by Mr. E. A. Pratt in 1890 in Szechuan, Cladrastis sinensis was thought to provide another example of two species of trees belonging to the same genus being represented by solitary examples in America and Asia—in the New World by C. tinctoria, and the Old World by C. sinensis. More recently, however, two further species have been described, C. Wilsonii, Takeda, and C. shikokiana, Makino.

The fact that a small standard tree at Kew is flowering when less than 12 feet high suggests that the Chinese Yellow Wood will be a better flowering tree than C. tinctoria. *A. O.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Lindley Up to Date.—It is good to see *Novice* urging on an up-to-date version of Lindley's *Theory and Practice of Horticulture*. It is now some years since I approached a certain person with the suggestion that the work should be brought into harmony with modern knowledge, but the recipient of my letter replied that though he had thought of it himself, he found he took too small a size in shoes for the purpose. I hope that perhaps he may now find that his measurement was erroneous Really, such a work should now be done by a number of authors, under a strict Editor who has many blue pencils and engaging smiles. I would rather, however, that the plan of the work should be retained. Perhaps by now *A. N.* may have found Monilia on his Plums and his Broad Beans may have plumped up. Dry air, low temperature and lack of rain seem to account here for the determining of many of our woes when coupled with the lack of ripening rays last "summer." Yesterday I was looking at some old Pear trees hardly less and probably more than 150 years old; they had canker, scab, Pear sucker and caterpillar attack, and yet seemed full of vigour; hard by were younglings, perhaps of twenty years or so, dying and dead from no evident cause. *H. E. D.*

Iris Kaempferi and Other "Difficult" Plants—I wonder if any of your correspondents can tell me how to grow Iris Kaempferi. It is no good Mr. W. Auton, of Pyrford Court, telling me, as he does in *The Gardeners' Chronicle* of July 21 (p. 38), that he grows the plants in deep, rich, moist soil: I dare say he does, but I tried that way years ago and I believe I have tried them in every possible way, in sun and shade, in damp and dry places, in limy soil and lime-free soil, in clay, in sand, in tubs sunk in water in summer and lifted out in winter, and in beds which may be irrigated in summer, but all to no purpose. The leaves always turn yellow, the plants dwindle, and I never get a flower. Another plant which absolutely refuses to grow here is Spiraea palmata, though I have tried it in almost as many ways as Iris Kaempferi, and it occurs to me these plants must require similar soil, because I was at a garden some ten miles from here last week where both plants were growing luxuriantly in apparently the same kind of soil as ours; and so were Roses, which are by no means satisfactory here. Another plant which has always defeated me is the pink Daphne Mezereon, although the white variety is quite happy, as are a great many other Daphnes. The pink one grows perfectly well in my kitchen garden, which is about a quarter of a mile from the house, and although I have brought soil from there to the rock garden and tried to grow it therein, I have not succeeded. I have, of course, grown it from seed, as well as from young, purchased plants which I have tried planting at different times of the year. The result is always the same. Another flower I am very fond of is the Phlox. Anyone who is asked what a Phlox wants would say plenty of manure and plenty of moisture, but this is not enough here, and I feel sure something is lacking in my soil which all the above plants require, and I should very much like to know what that something is. Another quite ordinary plant which dies out here is Lychnis Viscaria splendens, though I have not perhaps taken the same trouble with this as with the other plants mentioned. I may say that I grow a very large collection of herbaceous and alpine plants, as well as a large collection of shrubs, and most things do quite well here. It may be suggested I should have my soil analysed, but this I have already had done, to ascertain the lime content. One sample contained .69 and another .33 lime, but there are all kinds of soil here from clay to limestone brash or oolite, and nothing I have used so far will grow any of the above-named plants satisfactorily. Can anyone help me? *M. F., Stow-on-the-Wold.*

SOCIETIES.

NATIONAL CARNATION AND PICOTEE.

The second show of this old-established society, which was held in conjunction with the R.H.S. fortnightly meeting of July 24 was, like that of a fortnight previous, a small affair. We assume that the various classes were of the same intention as before, but there was no schedule issued, and the exhibitors' cards bore no information other than the number of the class and the names of the exhibitor.

First-Class Certificates.

Ivan Lowe.—A very attractive yellow-ground, fancy, border variety. The ground colour is shaded with buff and the flower is heavily marked with dull crimson (Fig. 28). Shown by Messrs. Lowe and Gibson.

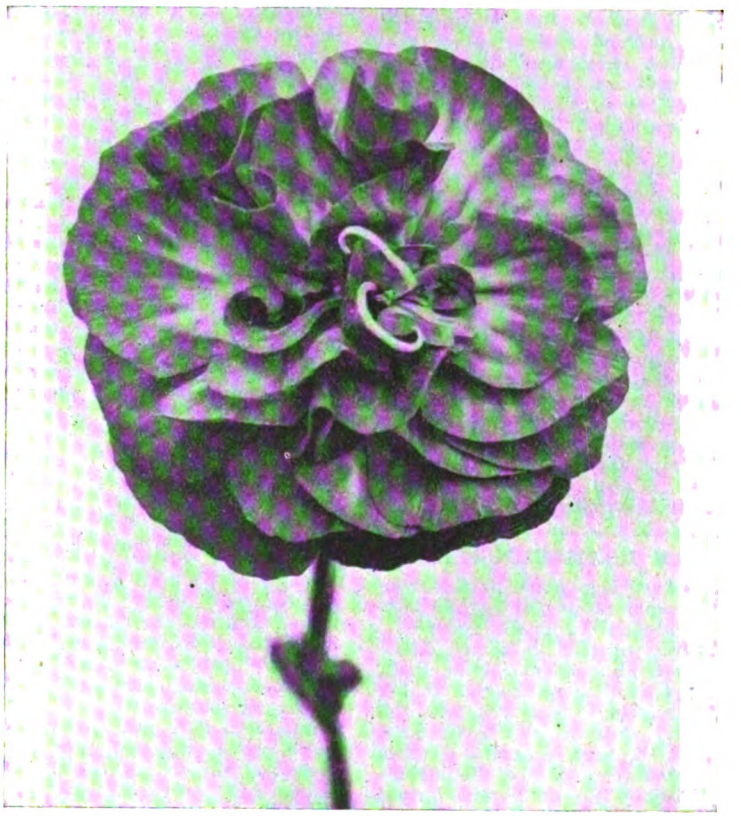

FIG. 28.—CARNATION IVAN LOW: NATIONAL CARNATION AND PICOTEE SOCIETY'S FIRST CLASS CERTIFICATE, JULY 24.

Mrs. Edmund Charrington.—This is a chaste and beautiful white-ground fancy, of more than average size and great substance. It might be described as a paler Jessie Murray and, as in that good sort, the white ground is very clear and clean. It is freely marked with pale lilac. Shown by Messrs. Lowe and Gibson.

Exhibition Flowers.

The only collection was arranged by Messrs. Lowe and Gibson, and, in addition to their two new Carnations, included an especially fine vase of Eclipse, which was the premier Picotee. Of the Carnations Jessie Murray, Surrey Clove, Daffodil, Fair Ellen and Maisie Lowe were of great merit.

Miss E. Shiffner won a number of first prizes with splendid blooms of such Carnations as Gordon Douglas, Lord Kitchener and Red Clove, and in Togo had the premier heavy-edged, yellow-ground Picotee. In what were apparently the colour classes, Miss Shiffner had magnificent vases of Opalesce, deep rose; Mrs. W. R. Smith, blush; Mrs. J. Marshall, crimson; Purity, white; and Border Yellow, which was a premier bloom, while Mrs. A. Brotherston was her best fancy, and also the premier Clove. Other deliciously scented Clove sorts were Dora, as shown by Mr. E. Charrington, and Purple Clove and Rose Clove, shown by Mr. S. Williams.

Mr. E. Charrington won first prizes with superb blooms such as Grey Douglas, Glamour and Veldt Fire Carnations, and in Eclipse he had the premier Picotee of his section.

The Edmund Charrington Cup was awarded to Mr. H. A. Knapton.

SAFFRON WALDEN FLOWER SHOW.

Established in 1819 (104 years ago), the records of the Saffron Walden Horticultural Society show that it has held many notable summer exhibitions, which have ranked among the best in the Eastern Counties. The Society, however, fell from its high estate some 26 years ago, owing partly to a succession of wet show days and partly to the popular taste at that time requiring something more than a horticultural exhibition to satisfy it, with the result that, so far as can be recollected, there had been no summer flower show at Saffron Walden since 1897.

The revival of the Horticultural Society and its annual show has been a project near to the heart of the present Mayor of the borough (Mr. D. Miller) for some long time past, and he is to be congratulated on seeing the Society resuscitated and the Flower Show re-established during his mayoralty, and that on a scale which promises to again place it in the front rank. The Mayor enlisted the co-operation and active support of all the nurserymen and head gardeners and many of the leading amateurs in the town and district, and, with an energetic working committee, the show, held in the grounds of Farmadine, on Thursday, July 26, was quite a success.

The season has been one of the worst on record in this district for garden produce, with the result that the entries in some of the classes were not strong, but this was more than made up for by the fine quality of the complimentary and trade exhibits. One of outstanding merit was a magnificent group of

Digitized by Google

280 dozen blooms of Carnations shown by Mr. C. G. Engelmann. The group was equal to that exhibited by Mr. Engelmann at Chelsea a few weeks ago, when he won the R.H.S. gold medal. The group contained the latest novelties and was awarded the Society's gold medal. Messrs. J. Vert and Sons, also of Saffron Walden, had a very fine group of Campanulas, Cannas, Clematis, Coleus, Palms, and Ferns, but the feature of their display was their very fine display of pot fruit trees, 50 feet by 12 feet, which also was awarded the Society's gold medal. The same firm had a miniature rock garden and an exhibit of Comet Tomatos.

Running the whole length of one side of a large marquee was a magnificent complimentary group of double Begonias, Orchids, Larkspurs, Cannas, Palms, and Ferns from the conservatories of Miss Gibson, of Hill House, tastefully set up by Mr. G. Barker, her head gardener. It was greatly admired, and was awarded the Society's gold medal.

To attract trade displays from outside the town, the Society offered two prizes of £10 and £5 for the best exhibits of flowers, and some first-class blooms were shown. The first prize was won by Messrs. D. Prior and Son, Colchester, with a display of 22 stands of Roses, including the new Ideal, Alice Amos, Diana, and Vera Prior; and the second prize by Mr. W. Wells, jun., Merstham, with a superb collection of herbaceous cut flowers.

In the competitive classes Mr. W. H. Scott, a local amateur, won the first prize and the silver challenge cup, presented by Mr. C. Engelmann, with a choice exhibit of 20 varieties of cut Roses; and Sir Hy. Babington Smith was awarded the first prize and the silver challenge cup, presented by Messrs. Vert and Sons, for a superb collection of vegetables.

Another notable exhibit which obtained a premier award was a decorated table of eight dishes of choice ripe fruit shown by Mr. W. Foot Mitchell, M.P., of Quendon Hall (gardener, Mr. G. Middleton).

BECKENHAM HORTICULTURAL.

Arrangements have been made by the members of the Beckenham Society to pay visits to various places of interest during this summer.

On July 19 a visit was paid to Messrs. James Carter and Co.'s establishment at Raynes Park, about 40 members availing themselves of the opportunity of inspecting the warehouses and grounds. The party were met by Mr. Gardner, who, on behalf of the firm, extended a warm welcome to the members of the Beckenham Horticultural Society. The party was formed up into three sections and taken through the sections as follows:—Order Department, Seed-selecting, Packeting, Packing and Despatch Departments. Packet-making, printing, seed cleaning and selecting by machine and hand, and many wonderful and interesting things were seen, and, had time permitted, many more were to have been inspected before tea—generously provided by the firm. Tea over, the trial grounds were next inspected, but owing to the fall of much-needed rain, this part was hurried over, but the company paid special attention to several new introductions, including Carter's Dwarf Early Giant Pea.

Mr. Piper, chairman of the committee, on behalf of the above Society, then asked Mr. Gardner to thank the firm for its very kind invitation and warm welcome.

Obituary.

Nicholas German.—Mr. German, of Cardiff, was a fine old gardener, who left his mark on the past generation. Always an enthusiast in his profession, he excelled as a cultivator, but it is chiefly as an exhibitor of groups of ornamental plants that he will be best remembered. In the days when plants formed the chief attraction at York, Derby, Leicester, and many other centres, Mr. German exhibited on quite original lines, and in place of the massive groups then in vogue, he made artistic displays which were an education and delight. Mr. German had also a genius for friendship, and those who knew him intimately esteemed the privilege of his acquaintance. To the many young men who passed through his hands, he was generous in advice, and always delighted in their success in life. He came to Llandough Castle, near Cardiff, in 1900, as gardener to E. H. Ebsworth, Esq., and reconstructed the old place with great taste and skill. He had reached his 73rd year, and his remains were laid to rest a few days ago in the presence of those who knew him well, and who now mourn his loss.

LAW NOTE.

A RATE OF EXCHANGE PROBLEM.

A case which came on for trial in the High Court a short time ago raised an interesting problem in connection with foreign rates of exchange, which should be noted by those readers who buy or sell goods abroad.

As action was brought by a foreigner who had sold goods to an English firm. The buyers failed to pay, and, as their defence to the proceedings failed, judgment was given in the plaintiff's favour for an amount representing £313 in English money. Thereupon a further dispute arose between the opposing parties. The debt had to be paid in German marks, and, owing to the fluctuations in the rate of exchange, it became a matter of importance as to the date on which the rate of exchange should be taken. On the one side, Counsel contended that the correct date would be the date when the purchase money first became due, while, on the other side, it was contended that the proper date to take would be the date when judgment was given directing the precise amount to be paid

After reserving judgment, the learned judge pointed out that it would be very inconvenient if it were necessary to take the date of the judgment as being the date on which the rate of exchange ought to be calculated. In that event there would be a different rule prevailing according to whether the claim were one for damages or were for a liquidated amount, as in the case of a debt. Furthermore, if the date to be taken was the date of the judgment, there would be a considerable incentive for the party in whose favour the continually falling rate of exchange would operate to delay the case for so long as possible, while, if the business of the courts became congested, the effect might be to cause great injustice. On various grounds, therefore, the judge held that the rate of exchange must be calculated as on the date when the debt first became payable, and no on the date when judgment was given. *H. M. V.*

INQUIRY.

I have frequently noted this season in old pastures, where no extra inducement has been given them, the appearance of white, red and yellow Clover. I should like to know whether this is general, and how it is accounted for. Did the great drought of 1921 have anything to do with it, and by sterilising the land, or setting up the necessary chemical activity in the soil, make conditions more suitable for these leguminous plants? If such is the reason, how may the Clover be maintained? *J. E.*

ANSWERS TO CORRESPONDENTS.

Apple Twig Mildewed: *M. L.* The blight on your Apple tree is caused by Apple mildew, which has no connection whatever with American blight, the one being a fungus disease and the other an insect pest. Certain varieties are more susceptible to mildew than others. Spray the trees in early spring, before the buds burst, with Bordeaux mixture or lime sulphur, at winter strength, and when the fungus makes its appearance spray with a mixture of soft soap and ammonium polysulphide. Badly diseased shoots should be cut back beyond the limit of attack.

Asters and Pansies Diseased: *G. P.* The disease attacking your Asters and Pansies is the one commonly known by the name of "damping off." It is due to the presence of a fungus, Pythium debaryanum. Use fresh or sterilised soil and keep the surface as dry as possible without harming the roots.

Carnations Failing: *F. H.* If you will send specimens, we will endeavour to discover what is the cause of the trouble.

Gardener's Holiday: *A. H. O'L.* Unless an annual holiday was arranged for in the agreement you cannot demand a vacation, consequently, unless your employer is considerate, you are at a disadvantage. Possibly if you could arrange for someone to do what is necessary in your absence a holiday might be arranged.

Malmaison Carnations: *C.* Some error in cultivation has caused your Malmaison Carnations to go blind. The discoloration of the points of the buds may be caused by green fly, which was not checked in time. We should have no hesitation in layering from these plants; afford plenty of air on all favourable occasions, keep the plants clean, and let the winter temperature range from 43° to 48°, according to the outside conditions. Keep the plants moderately dry at the roots in winter and you will then have no difficulty in flowering them.

Muscat of Alexandria Grapes Shanking: *Puzzled.* The only fault to find with your vine border is that you probably made it too deep and too rich; a depth of 2 feet 9 inches is ample. Possibly neglect in watering, stopping the laterals, etc., during the war resulted in the roots descending deeply for moisture. Many and varied are the causes of shanking, including over-cropping, attacks of red spider, dryness at the roots, borders of excessively rich materials, various checks, and the roots descending into cold subsoils. Avoid these evils so far as possible, and you will not be troubled with shanking. In your case the roots appear to be at fault, and the only remedy that can be adopted is to take the vines up carefully, back to the first section, clear the drainage and renew the border, introducing a greater proportion of porous materials than before. After replanting the roots use horse droppings, in preference to decayed manure of a close texture, for mulching, to allow the air to pass through freely; also allow a few more laterals to grow after the Grapes commence to colour.

Name of Fruit: *G. F. H.* Not recognised.

Names of Plants: *W. H. D.* 1, Sedum hispanicum; 2, S. album; 3, S. spurium; 4, S. altissimum; 5 S. Anacampseros; 6, S. reflexum; 7, Saxifraga Stansfieldii; 8, S. canaliculata; 9, Veronica orientalis; 10, Sempervivum tectorum; 11, Polygonum amplexicaule; 12, Sempervivum, sp., probably S. Funckii. *F. K.* 1, Phlomis fruticosa (yellow flower); 2, Sisyrinchium striatum. *J. B. S.* 1, Anaphalis margaritacea; 2, Borago laxiflora; 3, Potentilla fruticosa; 4, Pyrus species; 5, Gaultheria Shallon. *J. T. S.* 1, Podophyllum Emodi; 2, Gaultheria Shallon; 3, Photinia serrulata; 4, missing; 5, Coronilla cappadocica; 6, Santolina Chamaecyparissus; 7, Anaphalis nubigenia; 8, Veronica Armstrongii; 9, Trillium grandiflorum; 10, Aubrietia deltoidea variegata; 11, Veronica, sp. *J. C.* Chara gracilis.

Ox Eye Daisy Fasciated: *W.N.* The specimen received showed a peculiar type of fasciation, but one not at all uncommon among rapidly growing hardy perennials. It is generally assumed that fasciation is due to the adhesion of two or more buds at a very early stage of their development, and before the growth is produced above ground; the stems eventually merge into each other and become flattened, and often produce badly shaped flowers.

Stocks for Plums. Information of a useful kind, supplementing that already obtained in this country by Mr. Hatton at the East Malling Fruit Station (see *Journal of Pomology*, II, No. 4, September, 1911), is published* by Prof. U. P. Hedrick on stocks most suitable for Plums. In the American trials which have been in progress during the past ten years, the stocks submitted to comparative tests are Prunus americana (American stock); the hybrid between P. cerasifera and P. munsoniana, known as Marianna stock; the Myrobalan (P. cerasifera); St. Julien, P. insititia; the Peach, P. persica; and the Domestica stock (P. domestica). In addition the varieties of Plum included in the experiment were also grown on their own roots. Each of the stocks used has certain valuable qualities, though none of them may perhaps be regarded as the ideal stock for general use. None appears to give what is so much wanted, at all events by gardeners, a dwarfing stock. P. americana is hardy, vigorous, and resistant to diseases. It is also easily budded. In nursery practice the P. americana stocks in America are raised from pits (seed) and hence it is not surprising that this stock shows a wide range of variation. Upwards of two hundred varieties are known, and there will therefore be a lot of work to do when the time comes for determining which are the best and most suitable for special purposes. P. americana would appear to be a valuable stock for cold climates; but it has the great fault of suckering badly. The hybrid Marianna stock forms naturally a large tree and is resistant to pests. Its use as a stock is due to the readiness with which it may be reproduced vegetatively by cuttings, its free union with cultivated Plums grafted or budded on it, vigorous growth and its lack of the serious defect of suckering. The Myrobalan stock, used extensively in this country, and certainly the commonest in Plum orchards in N. America, is a big tree, easily budded. It is also cheap. As many growers of Plums in this country know, it suckers badly, and it is stated that when used as a stock the trees are short-lived and slow in coming into bearing. It is raised from seed which is generally collected in Italy and sent to France. In former days French growers used to raise the stock from cuttings and thus obtained a more uniform stock than that which can be expected from seed. It would be interesting to know why this practice has been abandoned and whether it might not be resumed with advantage to the orchardist. The St. Julien stock forms naturally a tree not unlike the common Damson and, like the Myrobalan, is largely—but not entirely—grown from seeds. French fruit raisers insist, however, that it serves the purpose of stock best when raised by vegetative propagation, e.g., from suckers or layers. Many Plum growers regard St. Julien as the best Plum stock, vigorous, hardy, long-lived, suckering but little and adapted to various soils. Its only defect is apparently that it will not do in cold climates. Nurserymen, on the other hand, are apt to prefer Myrobalan because the seedlings of the latter are more easily obtained and take the bud better. St. Julien is said to be less resistant to fungous attack and to make less vigorous growth than some others. Peach stocks raised from seed of wild plants are sometimes favoured by American Plum growers, especially for Japanese Plums. The scion is root-budded on the Peach. Prunus domestica stocks, of which several varieties are used in Europe, are not employed in America. The Plums used as scions included five varieties of P. domestica, viz., Bradshaw, Grand Duke, Italian Prune, Lombard and Reine Claude; two derivatives of P. insititia, viz., Shropshire and Drap d'Or; three Japanese Plums, varieties of P. salicina, viz., Abundance, Burbank and Chabot; two cultivated forms of P. munsoniana and one (de Soto) of P. americana. The results indicate that the five varieties of European Plums, Bradshaw, Grand Duke and the others named above, yield fruit much the best when grown on Myrobalan stocks and also grow best on this stock. These varieties fruit next best on their own roots and less well, in descending order, on Peach, Marianna, St. Julien and P. americana. Two of the Japanese Plums, Chabot and Burbank, also fruit best on Myrobalan stock, but the third, Abundance, does worse on it than on any other stock used—the stock apparently imparting too great vigour to the tree. It is therefore interesting to observe that Abundance fruits best when grown budded on Peach. The chief conclusions reached are that Myrobalan is the best stock for general purposes, and that St. Julien is second best.

* *Bulletin of the New York Agricultural Experiment Station*, Geneva, New York, January, 1923.

Shrewsbury Floral Fête.—The great annual exhibition of the Shropshire Horticultural Society will be held in the Quarry Park, Shrewsbury, on Wednesday and Thursday next, August 15 and 16. The cash prizes offered amount to over £1,200, and of this sum £115 is offered in cash prizes for rock gardens. In addition, numerous gold and silver medals, silver cups and bowls will be competed for, including a special extra prize of a silver cup offered by the President, Lord Berwick, for competition in the class for a collection of herbaceous plants and flowers. Everything points to a very successful exhibition. The Secretary is Mr. W. G. Brazier, The Square, Shrewsbury.

Public Parks and Open Spaces.—The leading citizens of Huntley recently formed a syndicate for the purpose of purchasing Castle Huntley Park and other grounds, from the Duke of Richmond and Gordon, for use as a public park for the town of Huntley. We understand that the amount required for the purchase of the land has been subscribed.—The Davie Public Park presented to the communities of Blairgowrie and Rattray by the late Mr. William Davie and his sister, the late Mrs. Nicoll, was opened to the public on the 26th ult., by Mr. W. Macpherson. The higher slopes of the park have been terraced and numerous seats have been placed thereon from which a magnificent view may be obtained over a wide expanse of the Valley of Strathmore. On the lower and level areas putting greens, tennis courts, a cricket pitch, and a football ground have been laid out.

Bequest to The Scottish Horticultural Society.—The late Dr. George Dickson, of Merchiston Park, Edinburgh, provided in his will for a sum of £150 to be paid from the residue of his estate to the Scottish Horticultural Society to provide a prize annually at the Edinburgh Exhibition, to be awarded to the competitor producing and exhibiting the heaviest bunch of home-grown Grapes. He made the conditions that this award should be known as the "James Dickson Prize" in memory of his late father, that the bunch of Grapes securing the award must be the product of a single eye, and that only gardeners in private establishments should be allowed to compete.

Sir William Thiselton-Dyer.—The celebration of his eightieth birthday by Sir William Thiselton-Dyer, an occasion which gave us pleasure to reproduce a recent portrait of this eminent botanist, has prompted his botanical friends in all parts of Great Britain and Ireland to express their congratulations and appreciation in the following letter:—

Dear Sir William,—The occasion of your eightieth birthday affords us the opportunity of which we gladly avail ourselves, not only of offering you our congratulations upon having attained so venerable an age, but also of assuring you of our continued regard and esteem. In doing so we who sign this letter do but acknowledge our indebtedness to you for the inspiration and guidance which we, both as teachers and researchers, have derived directly or indirectly from your own early work as a professor of botany. We regard that work, and more especially the courses of practical instruction conducted by you at South Kensington in the years 1875 and 1876, as having inaugurated the renaissance of the study of the structure and functions of plants which had been so brilliantly carried on by British botanists in earlier times. It must, we feel sure, afford you great and justifiable satisfaction to contemplate the marvellous development of such studies in this country during the years that have passed since you quickened them into new life. The professional career on which you had embarked so brilliantly was unfortunately, as it may have seemed at the time, brought to a close by your appointment to the assistant directorship of Kew in 1875 and your subsequent appointment as director ten years later. The work that you were enabled to carry out at Kew has been of such national importance, that, however much we may regret the loss of the stimulating influence you would undoubtedly have exerted as a professor, we all realise the great and lasting services you have rendered to botany, not only from the purely scientific point of view, but

Digitized by Google

also in relation to the development and encouragement of botanical enterprise throughout the British Empire. Another notable result of the interest you inspired was the successful launching of the *Annals of Botany*, which has come to be one of the leading botanical periodicals of the world. We do not forget that it was your enthusiasm that turned the scale when the question of "to be or not to be" hung in the balance. The *Annals* is a lasting monument to your courage and prescience. It would need a lengthy document were we to attempt to set out in detail the value of your many efforts for the promotion of our science, but in conclusion we feel we must refer to the noble work you did in saving the old Chelsea Physic Garden from destruction. Thanks to you, London has now a botanic garden where students and teachers can study the structure and functions of plants and pursue those studies which you did so much to promote. With our very kind regards and good wishes, believe us to be, dear Sir William, Yours very truly, D. H. Scott, S. H. Vines, F. O. Bower, Balfour, H. T. Brown, D. Prain, F. Darwin, H. H. Dixon, A. C. Seward, J. B. Farmer, F. Keeble, A. B. Rendle, A. Shipley, H. Wager, F. F. Blackman, V. H. Blackman, F. W. Oliver, A. G. Tansley, F. E. Weiss, A. W. Hill, and all the leading botanists in Great Britain and Ireland.

Potato Trials at East Craigs.—On the 1st inst. a large number of Potato growers and Potato merchants visited the Plant Registration Station at East Craigs, Corstorphine, Edinburgh, to inspect the trails conducted there by the Scottish Board of Agriculture. Sir Robert Greig, Chairman of the Board, stated that the largest collection of varieties of Potatos to be found in Great Britain, and possibly the largest to be found in the world, was the one at East Craigs. About ten acres of land are devoted to Potato trials, and there are about seventeen hundred plots wherein seven hundred varieties of Potatos are cultivated for registration purposes. The plots are divided into three types, i.e. (1), plots of a standard variety to check variation and soil conditions; (2) control plots of standard varieties for comparison with new varieties in terms of maturity and yield; and (3) new varieties. The latter include about one hundred quite new sorts, including many from the Meigle district of Perthshire, a number of which are already known to be immune to Wart Disease. All the new varieties have been classified, and the subjects of Leaf Curl and Mosaic Disease are being worked out at East Craigs, but the tests for Wart Disease are carried out at the Board of Agriculture's grounds at Philipstoun.

Kinnoull Hill, Perth.—Kinnoull Hill, a notable feature of the landscape on the east of the River Tay, rises to a height of about 780 feet and commands magnificent views of the valley of the Tay and the distant hills. For many years the public have had access to the hill, and before the war it was a popular resort of the citizens of the town of Perth. During the war it was denuded of its trees, which were converted into timber, and since then the popularity of Kinnoull Hill has declined. Now, however, there is a possibility that its former beauty may be restored in due time, as Lord Dewar has offered to purchase the hill and present it to his native town of Perth. In a letter addressed to the Lord Provost, Lt.-Col. the Hon. John Dewar, Lord Dewar stated that he was in agreement with the Lord Provost's suggestion that as Kinnoull Hill was a historic site it should be preserved for all time as a playground for the people of Perth. Further, as the estate was for sale, he would consider it a privilege to be allowed to purchase Kinnoull Hill and present it to his native town and at the same time endow it to the extent necessary to restore and maintain its beauty. By special resolution the Perth Town Council accepted the generous offer and tendered the thanks of the town to Lord Dewar for his splendid gift.

Mr. J. B. Slade.—For fifty years Mr. J. B. Slade has been associated with the firm of Messrs. Protheroe and Morris, and for the greater part of that period has especially identified himself with the horticultural activities of his firm. As an auctioneer, whether at Cheapside or at a nursery sale, or at the sale of a private collection of Orchids, Mr. Slade is well known in the horticultural world. He possesses "the saving grace of humour" in abundant measure and has the happy knack of quickly getting on good terms with any audience of potential buyers. The value of nursery and market gardening businesses, of nursery stock, bulbs and other horticultural matters he has disposed of by a tap of his hammer must amount to a very large sum indeed. In celebration of his business jubilee Mr. Slade entertained his partners and members of the staff of Messrs. Protheroe and Morris to dinner on the 30th ult. at the Hotel Russell. In response to the toast of his health Mr. Slade referred to many interesting incidents in his business life, and to this account Mr. H. G. Morris added many humorous reminiscences of his association with Mr. Slade in the earlier days of

MR. J. B. SLADE.

their connection. Mr. Slade was presented with a souvenir of the occasion, and in returning thanks for it referred to the happy relations existing between members of the staff and the principals, and observed that eight of the senior members of the staff had rendered an aggregate of two hundred and seventy-seven years' service to the firm. Mr. Slade takes a keen interest in local affairs, and was a member of the Leyton Urban District Council for upwards of twenty years. He is also a member of the Essex County Council, a position he has held for twenty-six years.

New Canadian Plant Import Regulations.—The Ministry of Agriculture and Fisheries desires to give notice that new regulations have been issued by the Canadian Government, governing the entry of nursery stock and plants into the Dominion. The regulations, which will come into force on the 1st of September, may be summarised as follows, so far as concerns produce from England and Wales:—The term "plant" or "plants" includes all members of the vegetable kingdom and any plant or product of a plant. The term "nursery stock" includes all plants for ornamental purposes or propagation. Seeds and seed Potatos are not included. All shipments of nursery stock imported into Canada from this country must be accompanied by a certificate of inspection and a permit must be obtained by the importer. An official certificate must accompany the invoice and a copy of this certificate must be attached to each container. These certificates must be issued and signed by an authorised official and must state that the nursery stock covered by the certificate has been duly examined by the official and has been found apparently free from any pest or disease. Each container must also be clearly marked with the name and address of the consignor and of the consignee, the port of entry and also a declaration showing the quantity, kind and value of the nursery stock contained therein. Nursery stock will only be admitted through the following ports:—Niagara Falls, Ontario; St. John, New Brunswick; Montreal, Quebec, and Vancouver, British Columbia. Nursery stock will also be liable to inspection at the port of entry, and if found to be infected with any pest or disease, to protective treatment or destruction. The importation of nursery stock into Canada through the mails is prohibited. The importation of Potatos is prohibited, as also it is of the following species of the genus Pinus and the horticultural varieties, namely: White Pine (Pinus Strobus, L.); Western White Pine (Pinus monticola, Dougl.); Sugar Pine (Pinus Lambertiana, Dougl.); Stone or Cembrian Pine (Pinus Cembra, L.) and all other five-leaved species of the genus Pinus; all species and varieties of Currants and Gooseberries (Ribes and Grossularia) but not including the fruits of the latter; European Buckthorn (Rhamnus cathartica, L.) and Common or Rust Barberry (Berberis vulgaris, L.) and their hybrids and horticultural varieties; all species and varieties of Berberis and Odostemon (Mahonia) susceptible to Crown Rust of Oats and Black-stem rust of Wheat respectively, including B. amurensis, Rupr.; B. canadensis, Pursh.; B. Lycium, Royle; B. sibirica, Pall.; B. aristata, D.C., B. ilicifolia, Forst.; B. nepalensis, Spreng. and O. Aquifolium, Rydb., and all species and varieties of the genera Pseudotsuga, Tsuga and Larix. The Ministry is prepared to arrange for the necessary examination and certification of consignments on payment of a fee at the rate of two guineas per day for each inspector. The minimum fee charged will be one guinea.

Sandy Show.—The Jubilee exhibition of the enterprising Sandy Horticultural Society will be held on August 30 in the beautiful park of Sandye Place, kindly lent by Mrs. Graves. On this occasion there will be an extended programme, additional prizes will be offered, and the attractions will be more numerous than usual.

"Horticulture."—Those of our readers who receive the American horticultural papers will be familiar with the little journal issued under this title as a trade paper. In future it will be published by the Massachusetts Horticultural Society as a general horticultural magazine. It will be issued twice a month, as in the past, and will retain the old title. Mr. Farrington has been the manager of the paper for the past four years, and this gentleman has been appointed secretary of the Massachusetts Horticultural Society in succession to Mr. W. P. Rich, who has resigned his position after twenty-one years of continuous service. *Horticulture* was established by the late Mr. W. J. Stewart in 1904, and has a circulation throughout the United States. In the current issue of *Horticulture* it is stated "The day has now come, we feel, when the paper can be made to serve a bigger field and broader interests. Although catering largely for advanced amateur gardeners, it will keep closely in touch with the Arnold Arboretum and all sources of new material, so that it will be of continued interest to all florists and nurserymen." Mr. Rich, the late secretary, will continue in the service of the Society as assistant in the library.

Trial of Rock Roses and Tulip Species at Wisley.—The Royal Horticultural Society, bearing in mind the difficulty of exhibiting Rock Roses (Helianthemums and Cistuses) and the number of promising new seedlings that

Digitized by Google

have been recently raised, will carry out a trial of these plants at Wisley during the coming year. Three plants of each variety for trial should be in time to reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey (Horsley Station, Southern Railway), by the end of October, 1923. The Royal Horticultural Society also desires to compare the merits of wild species of Tulip as garden plants, and would be grateful if those having bulbs available would send examples (say six) of each to Wisley by the middle of October, 1923.

Appointments for the Ensuing Week.—Monday, August 13: United Horticultural Benefit and Provident Society's meeting. Tuesday, August 14: Clay Cross Horticultural Society's show; Dublin Flower show (two days). Wednesday, August 15: Shropshire Horticultural Society's show (two days); Keymer, Clayton and Hassocks Flower show; Banff Flower show. Friday, August 17: Perth Flower show (two days); Fort William Flower show; Rothesay Flower show; Eastbourne Horticultural Society's meeting. Saturday, August 18: London and North Western Railway Horticultural Society's show at Belle Vue Gardens; Burnley and District Horticultural Society's show; Fossoway Flower show; Colne Horticultural Society's show; Alyth Flower show; Maybole Flower show; Blackwood Flower show; Carnwath Flower show; Burntisland Flower show; Coupar-Angus Flower show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Tacsonia pinnatistipula.* This beautiful plant was introduced from Peru in 1826. As a handsome conservatory and summer climber for the flower garden it is deserving of universal cultivation; it grows rapidly and flowers freely. For flower garden decoration the plants should be grown in pots at least a year before they are required for planting out of doors, as by this means they become strong, and being well established there is greater certainty of an abundant production of blossoms in the open air. It does best on a conservatory wall; but if that is wanting, a site possessing a south aspect, somewhat screened on the north-east, should be selected; the main branches should be trained over arches or along trellis work, the lateral shoots on which the flowers are produced being induced to hang in graceful festoonings. Plant in turfy loam, peat, leaf-mould, and sand in about equal proportions, taking care that thorough drainage is secured. Give liquid manure waterings during the parching heat, as well as the showery growing periods of summer, and this beautiful climber will grow and bloom luxuriantly throughout the summer and autumnal months. There is a very fine specimen of this Tacsonia in the Camellia-house at Chatsworth. This house is span-roofed; one plant is planted against the back wall in a border one foot wide, three feet deep, and extending the length of the house. The plant is composed of eight principal stems, the largest of which is only three and a quarter inches in circumference, and yet it clothes 322 superficial feet of back wall, besides extending 288 lineal feet of rafter, the laterals hanging from the latter from one foot to six feet. On the 6th ult. I counted 480 flowers upon this plant. Under liberal culture this climber is disposed, like other Passion flowers, to run too much to wood; to obviate this, frequent pruning and thinning of the lateral growths is indispensable; and being liable to attacks of red spider in dry weather, frequent syringings are also necessary out of doors as well as in the conservatory. *George Taylor, Chatsworth.* "*Gard. Chron.*," *August* 5, 1848.

Publications Received.—*Outline of Genetics.* By Merle C. Coulter. Price $1.60 post free; *The Story of the Maize Plant.* By Paul Weatherwax. Price $1.85 post free. Both published by the University of Chicago Press, 5750, Ellis Avenue, Chicago, Illinois.—*International Review of the Science and Practice of Agriculture.* No. 2, International Institute of Agriculture, Rome.

IRISES.

IRIS FLORENTINA.

WHICH is the Orris Root? This question is often asked by those interested in garden Irises, and the answer is that the principal supply of Orris Root is obtained from the old favourite Iris florentina—the early-flowering sweetly-scented Florentine Iris. This Iris is seen in most English gardens, and although very common, it is at the same time most beautiful and effective. The flowers are white or nearly so, and incidentally they are often used for church decoration. No Iris could be more amenable to general cultivation, and it is very free flowering. As a border plant it is all that could be desired, coming into bloom when the Tulips are with us, or indeed Darwin Tulips may be planted with it with most telling effect. If plants of Iris florentina are planted out now and the Tulips at a later date, some capital garden effects may be obtained next May.

I should be interested to hear if Orris Root is grown commercially in this country. There seems to be no reason why it should not be. I have noticed that the peasants in France and Belgium occasionally grow Irises on the roofs of thatched cottages. This I have seen in the little villages around St. Omer and Ypres. In a recent work on Irises it is recorded that in the North of France, sometimes the ridge of the thatched cottage is given a coating of clay the whole width of the roof, and Irises are planted in the clay. Is this but an imitation of a similar practice in China and Japan?

At one time powdered Orris Root was used to beautify the complexion. Possibly it is still used for the purpose, and certainly is much used in perfumery and for sachet powders, tooth and hair powders, and other scented, dry preparations.

Doubtless most readers are familiar with the origin of the roof gardens of Irises in China and Japan, but the following story from Mrs. Fraser's book of *Japanese Tales* is worth quoting:—

"Once there was a great famine in the land, and it was forbidden to plant anything in the ground that could not be used for food. The frivolous Irises only supply the powder with which the women whiten their faces, but, their little ladyships could not be cheated out of that. Must we look like frights as well as die of hunger? So every woman had a tiny plantation of Irises on the roof of her house, where they are growing to this day."

It should be explained that the Iris thus grown by the Japanese ladies is I. tectorum (so named from *tectum*, meaning the roof of a house), this Iris being used for the same feminine purposes as the Florentine Iris.

It is said that Irises on the roof are a means of strengthening the thatch, and there is an ancient superstition that Irises on the roof are efficacious in the prevention of disease, and that Sempervivum tectorum is a preventative against a building being struck by lightning! These are Eastern and Western superstitions respectively.

FIG. 29—IRIS FLORENTINA.

The propagation of Orris Root is quite simple. The rhizomes are taken from the ground in late summer, cleaned, scraped and washed, then cut into pieces and placed in the sun to dry. When fresh, the rhizomes have an earthy odour, but in drying they acquire the familiar and pleasant odour of Violets, which is fully developed after about three years. In France I have noticed that the pieces of dried root are sometimes thrown on the fire to give out a pleasant odour in halls and dwelling rooms. *Herbert Cowley.*

[Regarding Orris Root, Mr. W. R. Dykes, in *The Genus Iris*, states: "This product of the Iris is apparently derived in Tuscany from I. germanica and pallida. These species are known to the peasantry under the common name of Giaggiolo. The rhizomes are dug up in August, and are then trimmed, peeled, and dried in the sun and sold to dealers, who export them from Leghorn and Trieste. The pieces have a flattened, shrivelled appearance, and bear on the under surface a number of small, roundish scars where the roots have been removed. *Eds.*]

The Week's Work.

THE ORCHID HOUSES.

By J. T. Barker, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

Treatment of Miltonias after Potting.—As the period after potting is one of the most critical in a plant's existence, some care is necessary to prevent it suffering. Put the newly potted Miltonias together in a house where a cool intermediate temperature is maintained, on a stage affording full exposure to the light, but shaded from strong sunshine. The supply of water to the roots during the early stages of growth is of great importance, as if too much or too little is given them the result is the same. By keeping the compost slightly on the dry side the roots will be induced to run through it readily, and at a later period water may be given in larger quantities, thereby encouraging large and strong growths. On bright days slight sprayings overhead will be most beneficial. The late-flowering varieties will need attention at a later period, but as they succeed in similar material and under precisely the same conditions, they require attention accordingly.

Cypripedium.—Plants of Cypripedium that were potted early in the year have filled their pots with roots, and as growth is most active during the present time every attention is necessary to see that they do not suffer through want of water. The recent hot weather has been to their benefit, especially where suitable conditions of atmospheric humidity have been maintained. The greater number of these Orchids revel in a warm, humid atmosphere, and spraying may be done two or three times daily, provided the plants are shaded from the sun. Spraying Cypripediums with clear water is of the greatest benefit in maintaining them in a thoroughly robust condition, also in keeping down thrips and other insect pests. Weak growing varieties, or divided plants that have not made satisfactory progress, should be placed together in a part of the house where they may have special attention and enjoy plenty of light. If any plant fails to thrive in one position in the particular house, it is advisable to remove it to another place, for it will generally be found that there is some place where these sickly plants recover more quickly than in any other. It may be a special shelf, or some damp position, and often a shift from one end of the house to the other will be the means of starting the plant into growth again.

HARDY FRUIT GARDEN.

By A. J. Hartless, Gardener to Major J. F. Harrison, King's Walden Bury, Hitchin, Hertfordshire.

Raspberries.—Remove old fruiting canes as soon as possible to admit air and light to the new canes which are retained. The latter should receive every encouragement to become well ripened.

American Blackberries.—These promise an exceptionally good crop. Following the other bush fruits they come in at a very useful time. Loganberries are also most useful both for dessert and cooking, and make very good jam.

Strawberries.—New plantations of Strawberries should be made on prepared ground. After the removal of the necessary number of rooted runners the older beds should be carefully hoed and cleaned. Labels, if of wood, should be renewed. In a selection of varieties of Strawberries it is better to confine attention to about four good sorts, useful for succession. A heavy cropper for jam-making should be considered. The variety International has done well with us this season, producing enormous fruits, but it is not to everyone's taste.

Apples.—It is to be hoped that the falling of Apples will cease. After a very heavy set, with fruits hanging in great clusters, the trees have experienced a severe natural thinning. This, as already suggested, may be due to sudden extremes of temperature. The trees should be watered and stimulants given to their roots, where necessary, and the ground well tilled by hoeing.

PLANTS UNDER GLASS.

By John Coutts, Assistant Curator, Royal Botanic Gardens, Kew.

Mignonette.—Well-grown plants of Mignonette always attract attention, and they are very useful for greenhouse decoration, but considerable care and skill are required to produce really good examples. Seeds should be sown now and again some time during September. The best results are usually obtained by sowing the seeds in the pots in which the plants are to flower, as Mignonette does not transplant very readily. The pots should be clean and well drained. The potting compost should consist of good, rich loam, with little or no leaf soil added. To keep the whole porous, old mortar rubble may be used instead of sand, as lime in some form is very essential for the successful cultivation of Mignonette. The compost should be pressed very firmly. While 48 sized pots are large enough to grow good useful examples in, if larger specimens are required the plants may, in due course, have a shift into six-inch pots. The seed pots should be stood in a cold frame and kept shaded until germination takes place, when the seedlings should be thinned out to three or four in a pot. A few may be grown one plant in a pot, training them up as small standards. Watering should be very carefully done until the pots are well filled with roots, while plenty of air should be given at all times. During the winter the plants should have a light, airy position in a cool greenhouse. As regards variety, a good selection of Machet is as good as any for cultivation in pots.

Achimenes.—As the earlier batches pass out of flower, they should be stood in cold frames to complete their growth, gradually withholding water as they die down. When thoroughly dry, they may be stored in their pots for the winter in a warm, dry house or shed; or the tubers may be turned out of their pots and stored in boxes in dry sand. Achimenes suffer very much from attacks of white fly; the later batches, if attacked, should be fumigated with sodium cyanide, using ¼ oz. per 1,000 cubic feet, or, if preferred, one of the approved proprietary remedies may be used.

Humea elegans.—Seed of this elegant greenhouse plant should be sown now in a cool greenhouse. This plant is generally regarded as somewhat difficult to grow successfully; this is no doubt true in its later stages of growth, when very careful watering is essential. Given proper treatment, no difficulty should be experienced in its younger stages, the chief essentials being careful watering and perfectly cool, airy conditions at all times.

Cyclamen.—Seed should now be sown to provide plants for next year. The soil in the seed pots or pans should be watered some hours previously to sowing. Arrange the seeds about half an inch apart; as they are generally very irregular in germinating, this allows of the more forward plants being removed without unduly disturbing the others. Stand the seed pots in a house with an intermediate temperature, cover them with a piece of glass and afford shade until germination takes place, when the more forward seedlings should be pricked off into pans or boxes, and when they are large enough potted off singly into thumb-pots.

Muehlenbeckia platyclada.—This is a very useful and elegant green-foliaged plant. It is easily propagated at any time by means of cuttings. Useful specimens may be grown in 48-sized pots.

THE KITCHEN GARDEN.

By R. W. Thatcher, Gardener to Mark Firth, Esq., Carlton Park, Market Harborough, Leicestershire.

Runner Beans.—The crop is somewhat later with us than usual, but the plants are now growing well and abundantly supplied with water. Runner Beans revel in plenty of sunlight, providing the roots are kept moist. They are much benefited by a light mulching of long, strawy litter, which allows the air to reach the roots. Mulching with heavy, close material is a frequent cause of the flowers dropping, and should be avoided. Give the plants a good spraying overhead every afternoon, as this will keep them fresh and prevent red spider making its appearance. Pick the pods so soon as they are ready, for if allowed to hang too long they become coarse and impoverish the plants.

Tomatos.—Remove all side shoots, and tie the plants securely to the trellises or sticks. The older leaves may be shortened a little to allow the sun to reach the fruit. Afford the plants plenty of water, and feed the roots occasionally with diluted liquid manure or some approved fertiliser. Plants intended for winter fruiting must be considered; sow a few seeds in light, well-drained soil, and when germination takes place stand the seedlings close to the glass to keep them sturdy. Grow the plants in a cool house or frame for the time being. For winter fruiting, a small, span-roofed house, well heated, is desirable, and should be given up entirely to Tomatos.

Spring Cabbage.—The principal sowing of this vegetable should be made early in August, and there is no better place in which to raise seedlings than a skeleton frame; failing this, sow on a border that is not too hot and dry. In either case, draw wide drills with the hoe, and thoroughly water the soil with a rosed can. Sow thinly, and cover the seeds lightly with fine soil; water the soil a second time when the surface has been raked finely. Shade the bed with thick tiffany or two or three thicknesses of old fish-netting. As soon as the young plants appear remove the covering and keep them well watered; also keep them clean by hand weeding. Harbinger and Flower of Spring are two of the best varieties to sow.

Carrots.—Small Carrots are always appreciated, and where there are frames vacant they may be utilised for sowing seeds in shallow drills about 6 inches apart. Sow the seeds thinly so that there may be little need for thinning. So soon as the young seedlings appear stir the soil between them to promote quick and healthy growth.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to J. A. Berners, Esq., Woolverstone Park Gardens, Ipswich.

Cucumbers.—Seeds should be sown forthwith for the production of plants for winter supplies; keep the plants close up to the glass after germination, and never allow them to become dry or rootbound, otherwise red spider may infest them, and greatly affect their growth. The fermenting material for making up the hot-bed should be prepared and transferred to the house when ready. The soil should be of a light, fibrous character, with some wood ash and bone-meal added. Feeding may be resorted to when the plants commence bearing fruits. Plants recently put out in beds should have their growths frequently stopped and regulated, while sturdiness should be induced by the application of top-dressings as the roots push through the soil, liquid manure being afforded when the plants come into bearing. Plants already in bearing should not be overcropped at this season; free-bearing varieties often produce very many more fruits than they can properly develop, therefore thinning should be carried out early to reduce the strain on the plants. Fire-heat may be necessary during dull weather in order to maintain a temperature of 75° to 80° by day, and 70° by night. Syringe the plants freely, and if black aphis appears, fumigate the house lightly and often until it disappears.

Digitized by Google

Plums.—In localities where the outdoor crop is good, it will not be so necessary to retard the later varieties of Plums under glass, as would be the case if the outdoor crop were scanty. Keep the shoots closely pinched in; leading growths inclining to grossness should be stopped. Some varieties with thin skins will crack if there is an excess of atmospheric moisture when the fruits are ripening; a sudden rise of temperature with a moisture-laden atmosphere will cause the fruits to crack wholesale. During hot weather the watering of trees in pots will need close attention, and on no account should the roots lack moisture. Stimulants should be freely supplied to trees on which the fruits are swelling; after ripening commences feeding should be reduced to a minimum. Trees in borders will benefit from a mulching of half-rotted cow manure; this saves watering and tends to keep the borders moist and cool.

THE FLOWER GARDEN.

By C. Turner, Gardener to Emily, Lady Ampthill, Ampthill Park, Ampthill, Bedfordshire.

Antirrhinum.—Seeds of Antirrhinums sown now will produce plants that will bloom considerably earlier than those raised from a sowing made early in the New Year, for the simple reason that August-sown plants will be about five months older, a fact which no amount of forcing in the New Year will make up for. Sow the seeds out of doors on a well-drained site, and directly the plants are strong enough transplant them on a warm border, where, in many localities, Antirrhinums will remain practically unhurt throughout the winter. In some instances the tops will be disfigured or injured, but this will not permanently harm the plants. Where, however, experience has shown the district to be too uncongenial for wintering the plants, the seedlings should be pricked out in a cold frame, over which the lights may be placed when necessary. The great enemy of the Antirrhinum in winter is damp at the roots; therefore, the place chosen for wintering the plants should be well drained and the soil rather light, as once the roots begin to rot the plants never recover, and though they may linger on and make an effort to bloom, they suddenly collapse in so doing. The spring sowing will supplement these plants, thus prolonging the season of flowering. A sprinkling of old mortar-rubble over the ground before the seedlings are dibbled out will help to promote healthiness of growth and check decay.

Gum Cistuses.—For beautifying an odd angle or corner of a building where it is warm and dry no better subject than Cistus ladaniferus can be found. It will revel in any such dry conditions while most other plants would only languish. True, the flowers are rather fugitive, but they are so freely produced and so pretty, particularly the blotched form, that few summer flowering shrubs can vie with it for effect.

Lavender.—If the flower spikes are wanted in a dry state they are better gathered before all the blossoms are fully open, to ensure longer preservation. Bushes from which the spikes are not gathered for indoor use should, when the flowers are quite over, have the dead stems cut away. Cuttings may be put in if fresh plants are wanted, or larger growths may be layered. Lavender bushes are often grown to form rows or hedges, and I have seen such cut over with shears—a practice, in my opinion, that spoils the character of the plant. To preserve the latter encourage upward growth and secure this to adequate support.

Armeria cephalotes.—The long flower stems, each crowned with a big head of bloom, make the Giant Thrift a useful border plant, yet it is much less commonly seen than the pale and deep rose forms of Armeria vulgaris that brighten many a garden pathway. In damp winters the cushions of the former have a tendency to decay in the centre, especially if they are rather big. A partial remedy is to divide the plants frequently, and this should be done soon after flowering, so that the plants may be established before bad weather sets in.

NOTES FROM WISLEY.

A pond in the gardens has many attractions. It is capable of being planted much in the same way as a flower bed, with the exception that in the case of a bed or border we like to see it full of plants, while water completely covered with leaves is undesirable. The round ponds at Wisley are nearly covered with the foliage of Nymphaeas and other aquatics, but the sight of four hundred blooms open in one small pond is ample compensation. These include Nymphaea Gladstoniana, N. James Brydon, N. Marliacea carnea and N. chromatella. The little yellow Villarsia nymphaeoides, and the fragrant Bog Bean (Menyanthes trifoliata) have also been flowering. On the banks are Japanese Iris which are provided with a feathery background of Spiraea Aruncus.

There is still much of interest to be found on the rock garden. Towards the top are some good plants of Lavatera Olbia, reflecting the sunlight from their glossy, pink petals and silken-haired stems and leaves. Another shrub in flower is Olearia nummularifolia, with rather fleshy, evergreen leaves. This is a most compact plant, and has a neat appearance throughout the year.

Among the sub-shrubs, the yellow heads of Helichrysum diosmifolium (rosmarinifolium) are conspicuous and remarkable for their distinct odour of curry. Another similar Composite is the white-flowered Santolina pinnata, with Yarrow-like foliage.

In the moraine some species of Wahlenbergia have been flowering, such as W. dalmatica, whose flowering stems press closely to the ground and terminate in an upright cluster of blue bells. The stems of W. vincaeflora are erect, and bear pretty flowers which justify the specific name (Fig. 30). Campanula Tommasiniana, also in bloom here, is a compact and bushy plant.

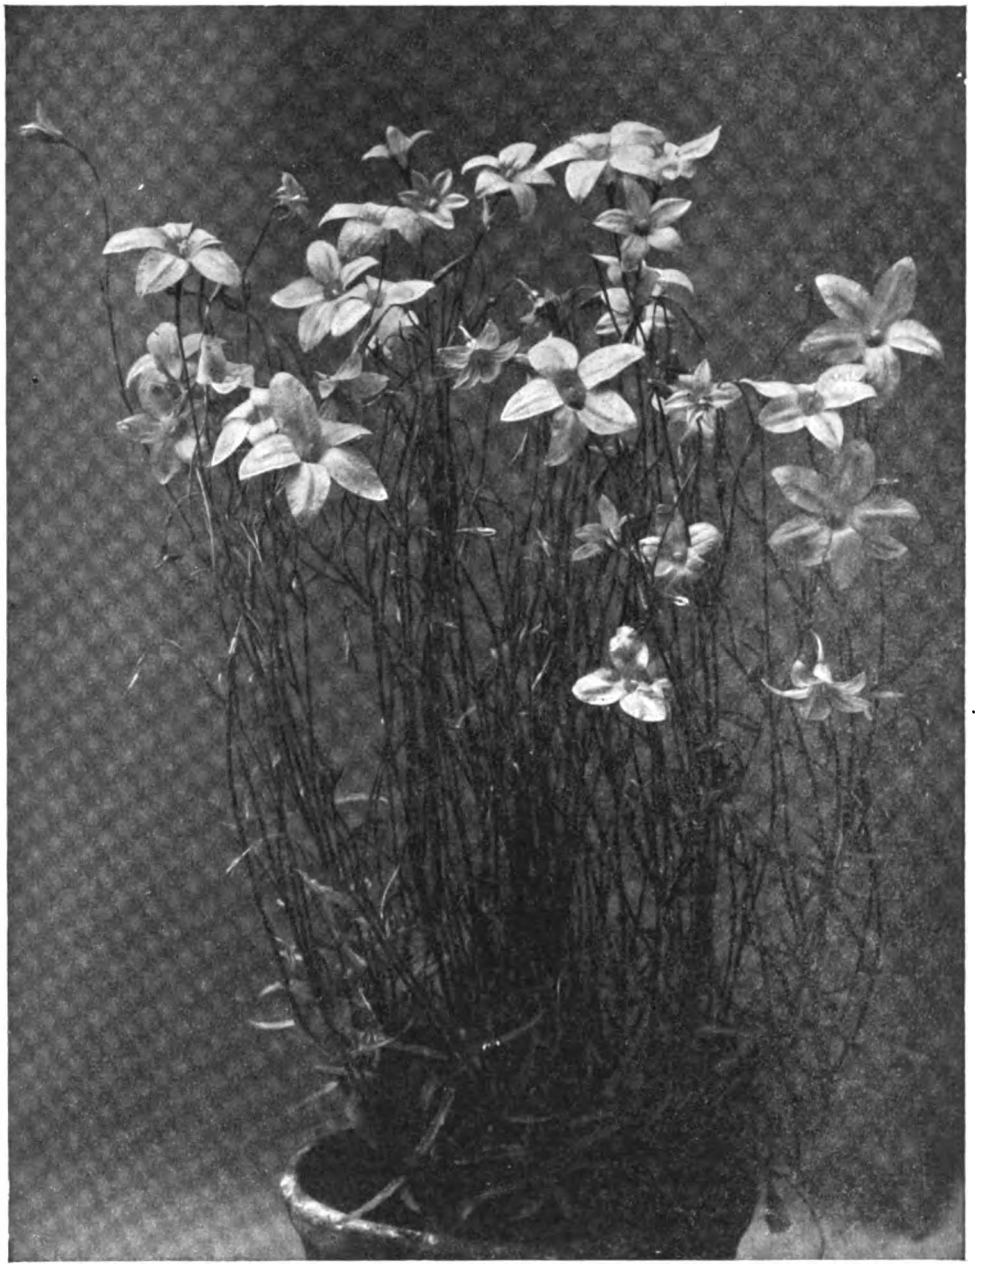

FIG. 30.—WAHLENBERGIA VINCAEFLORA GROWN AS A POT PLANT.

A large number of Sedums are flowering at the present time. One of the most striking is S. oreganum, with crimson stems and leaves, and yellow flowers. A most peculiar habit is shown by the pale, yellow-flowered S. pruinatum, which produces lengths of bare stem terminating in a tuft of leaves. An allied species is S. amplexicaule, which is just over, and at the present stage appears to be quite dead. In the spring, however, new growth of a fine pale green shade is made.

Many Ferns flourish among the rocks, such

Digitized by Google

as our native Blechnum spicant. A good plant of Adiantum pedatum is to be seen near the bog; the young growth is at first pink, turning to brown, at which stage the pairs of pinnae resemble the wings of small moths. When fully expanded the fronds are light green.

The recently introduced Hemerocallis nana (Forrest) has flowered, and is setting seed. This plant is barely a foot high, and bears Apricot-coloured flowers with a brown exterior. A new Cremanthodium species has also been successfully flowered, and is to be seen at the top of the rock garden.

The trial of Sweet Peas (red varieties) is making a good show, and has just been judged. *J. E. G. White.*

NOTES FROM A SOUTH DEVON GARDEN.

PELARGONIUM ROLLISON'S UNIQUE.

This, I think, is quite the handsomest of all the hybrids that are sometimes found in collections of the genus. It is of somewhat loose and straggling habit, and when grown in a pot requires a few supports, but I can imagine that it would be a very suitable plant for a well-lighted greenhouse pillar. Here I have it against the south wall of my house, where, in this climate, it seems to be perfectly hardy, and its fine trusses of deep rose-pink flowers attract considerable attention from early in April onwards. It is in full flower now with about forty trusses, and seems likely to continue in bloom throughout the summer. The trusses, which consist of eight or nine flowers, about two inches across, remind one strongly of the Pelargoniums now very rarely seen, which many years ago were the great ornament of every conservatory during late spring or early summer.

The foliage is quite ample, and strongly scented; the leaves, three or five-lobed or more, are three to five inches in diameter. The flower buds are conspicuously hairy, and all the young parts of the plant are more or less so. This plant is very remarkable in sometimes producing trusses of flowers of a paler and quite different colour. I have seen them many times, but I have now waited two years without a single example on this plant, so that their production must be capricious. With pot cultivation the variation may perhaps more frequently appear. It may perhaps have suggested the name Unique, but in any case this is a fine plant to commemorate the once famous firm of Tooting nurserymen, now almost forgotten.

Another hybrid Pelargonium, named Clorinda, and raised in comparatively recent years by the late Dr. Bonavia, I have planted in the same position, where it appears to be equally hardy, but is not nearly so good as an ornamental plant.

CINERARIA BEAUTY OF CAMBRIDGE.

Many years ago I made a number of hybrids and crosses of Cineraria, and this hybrid of C. Heritieri, pollenated by the garden Cineraria, seemed to prove itself the most popular. Without a name it cared for itself as a window plant in the neighbourhood of Cambridge, and was afterwards used as an ornamental plant for the conservatory of the Botanic Garden there. It is slightly shrubby in habit, and the ray florets are pure white, tipped with violet. The colour of the male parent is perfectly clear, and this suggests that an interesting and very ornamental series might be raised by using C. Heritieri as the female parent. There are great opportunities in the rich series of colours that may be used for the male parent. The reverse cross could be no less prolific of result. I am interested to find that Cineraria Beauty of Cambridge is hardy in front of my house, here in Torquay. Flowering all through the spring it has been very beautiful, and it is in flower now.

OXALIS FLORIBUNDA.

Some plants, though well known, are never fully appreciated until seen, perhaps by chance, under special conditions, and certainly I never knew the value of this Oxalis until early this summer, when I found it flowering as a pot plant. It was standing on a low wall, fully lighted on all sides, and formed a dense ball of innumerable pink flowers. I have known a good many very ornamental species of Oxalis, and the majority of those of greater rarity, but none finer than this. For many years I have grown it planted at the foot of a wall where it is perfectly hardy, its rhizomatous stems making a dense mass. There is a white variety.

THE RUNNER BEAN.

It is generally known, I dare say, that the Runner Bean is a perennial. Except in favoured parts of the country it soon dies in winter; here I had it in boxes last year, to make a screen, and now it is growing up again, in one case quite strongly. Except in this one case seedlings, I believe, would be stronger, but it would be interesting to know if it ever has been or could be grown a second year to produce a crop. I can remember no report upon this point. *R. Irwin Lynch, V.M.H., Torquay.*

ORCHID NOTES AND GLEANINGS.

MILTONIA ENDRESII.

Miltonia Endresii, one of the most beautiful of Miltonias, comes between M. Roezlii and M. vexillaria, its habit being nearer to that of the latter, while the form and texture of the flower are nearer to those of M. Roezlii. It was first discovered by Warscewicz on the Cordillera of Veragua, at 4,500-6,000 feet elevation, about 1849. Wallis rediscovered it twenty-two years later, but no living plants came to Europe until Endres collected it in Central America for Messrs. Jas. Veitch and Sons, in 1873. The first consignment contained only one live plant, but later a small lot came in good condition, one of which flowered at Chelsea in 1875 and secured a special certificate at the Royal Horticultural Society on February 16 that year. The species has always been rare, and little was seen of it until on March 10, 1898, H. H. Bolton, Esq., Height Side, Newchurch, showed it at the Manchester Orchid Society's spring meeting, and, again, from the same locality, Mr. J. Birchenall, of Alderley Edge, gained an Award of Merit for it at Manchester on March 2, 1911.

The late Sir Trevor Lawrence and Mr. H. T. Pitt had each two or three plants, sent by the late Richard Pfari from Costa Rica with good specimens of Epidendrum Endresii. Mr. Pitt still has the Epidendrum growing vigorously. It would be interesting to know whether he or any other grower has saved this pretty Miltonia from being lost to gardens by neglecting to seed it and raise true seedlings, which are always safer than imported plants. The flowers, produced as in M. vexillaria, are about three inches across, pure white, with a light purple blotch at the base of each segment, the crest of the lip having three short ridges on a yellow ground. It is especially desirable not only on account of its beauty, but for the use it would be in producing a new section by crossing. *J. O'Brien.*

PHALAENOPSIS LINDENI.

This Phalaenopsis is best known in this country by the description of the collector, Loher, in *Journal des Orchidees*, VI., p. 103 (see *Gard. Chron.*, July 13, 1895, p. 36), who found it in the Philippines and recorded it in 1895 as a new species. The description states that it resembles P. Schilleriana in the marbling of the leaves, which, however, are narrower than in that species. The flowers more nearly resemble those of P. rosea, but are twice their size. It is highly probable that it is a form of Phalaenopsis Veitchiana, recorded as a natural hybrid of P. Schilleriana and P. rosea, and for which Messrs. Jas. Veitch and Sons, Chelsea, obtained a First-class Certificate from the Royal Horticultural Society, March 15, 1876. The record of P. Venus (Lindeni × rosea) made in Japan will doubtless cause discussion as to the standing of P. Lindeni, and this note may help. In any case the Japanese hybrid will be interesting. The only plant of P. Lindeni flowered in this country was shown by Messrs. Charlesworth and Co. at a meeting of the R.H.S. on June 25, 1908 (see *Gard. Chron.*, June 27, 1908, p. 422). *J. O'B.*

INDOOR PLANTS.

MIMULUS GLUTINOSUS.

This is a very old greenhouse plant, but one seldom seen at the present day. The type is a shrubby plant with small, pleasing yellow flowers. There are, however, two varieties, viz., Sunbeam and coccineus, both of which are superior as garden plants to the type. The variety Sunbeam has larger, orange-yellow flowers, while the variety coccineus has smaller, bright crimson flowers. They are all easily propagated by means of cuttings, which, if inserted now, will make good plants next year.

SENECIO GLASTIFOLIUS.

This South African Senecio, with its rosy purple flowers, is very useful for conservatory decoration during late spring and early summer; for this purpose it should be propagated by means of cuttings inserted during the present month. This Senecio may also be raised from seeds sown early in the year. *J. C.*

NEW HYBRID ORCHIDS.

(*Continued from June 16, 1923, page 334.*)

Name.	Parentage.	Exhibitor.
Brasso-Cattleya Santiago del Estero	B.-C. Digbyano-Mendelii × C. Hardyana	Dr. Lacroze
Brasso-Laelio-Cattleya Marian	B.-C. Marguerite Fournier × L.-C. Canhamiana	Stuart Low.
Cattleya Gladiator	Gladys × Dowiana aurea	McBean.
Cattleya Nerissa	Schröderae × Tityus	Charlesworth.
Laelio-Cattleya Biddy	C. Iris × L.-C. Wellsiana	C. J. Lucas, Esq.
Laelio-Cattleya Lamart	L. Latona × L.-C. Martinetii	H. T. Pitt, Esq.
Laelio-Cattleya Murillo	L.-C. Rubens × C. Empress Frederick	Cowan.
Laelio-Cattleya Princeps	L.-C. Ville de Bruxelles × C. Mendelii	Armstrong and Brown.
Miltonia Vespertilio	vexillaria Leopold II × Sanderae	Sanders [1922.]
Miltonia Vespertilio var. Mrs. B. Peck	vexillaria × Sanderae	Mansell and Hatcher.
Miltonia William Pitt	Isabel Sander × Bleuana Reine Elisabeth	H. T. Pitt, Esq.
Odontioda Eclipse	Oda. Madeline × Odm. Alexandrina	P. Ralli, Esq.
Odontioda Iris	Oda. Brewii × Odm. Dusky Monarch	Charlesworth.
Odontioda J. Eversfield	Cochlioda miniata × Odm. Prince Albert	Lady Aberconway.
Odontioda Verulam	Oda. Madeline × Odm. majesticum	Sanders.

THE ORNATE GENTIANS.

I have heard from so many quarters of failures with those two glorious autumn-flowering Gentians, G. sino-ornata and G. Farreri, that I think it worth making known what I believe to be an almost infallible way of growing them. For a long time I have had very varying success with them, and many times I lost both strong open ground plants and large stocks of pot specimens. This year I have had most encouraging and continued success with both species.

During the past year I made up a bed of loam, which I obtained from a district in which Heather and Rhododendron flourish naturally, and with this loam I mixed equal parts of peat, and leaf mould. I planted both G. sino-ornata and G. Farreri in this bed, and they are now flourishing splendidly, having made great, fat, strong plants, full of vigorous shoots, and already covered with buds. I have struck many hundreds of cuttings of both G. Farreri and G. sino-ornata, this season, and have had them all potted in a mixture of equal parts of leaf mould and peat. Nothing could be more satisfactory than their health and growth. I give this hint for what it is worth to those who have failed hitherto with this plant.

Perhaps the word "infallible" is a strong one to use, but I have been so encouraged by the success of the peat and leaf mould treatment that I think it worth recommending to any who have failed to grow these two Gentians in the natural soil of their gardens.

In some places these species flourish without any special preparation or fussing, and the odd thing is that although I firmly believe in peat, I have heard of G. Farreri growing freely in a garden of almost pure chalk. G. Farreri is flowering unusually early this year. I have just heard from a friend near Sheffield, who has splendid clumps in his garden, that his plants are already in bloom. Last year it flowered in October and November.

The two species under notice are undoubtedly the two finest of the section. G. Farreri has great trumpets of clear, Cambridge blue, white throated, and striped outside with dull sapphire, amethyst, and old ivory: and G. sino-ornata has flowers almost the brilliant sapphire of those of the lovely G. acaulis with which most readers are familiar.

Gentiana Lawrencii, like a smaller Farreri, is very rare, and most difficult to keep, whilst G. Veitchiorum is almost equally rare, smaller and shorter in the bell than any of the others, and a deep Oxford blue.

Gentiana hexaphylla ("from the high Alps up the Szechwan-Kansu march of Tibet") has, to me, always been rather a mystery plant. I had never been able to obtain it, nor even seen it, but a few days ago I saw it—for the first time—on the rock garden at Kew. And very disappointed I was. It is a very poor relation of G. sino-ornata and the others, as the flowers are much smaller, and of a not very clear, watery blue. *Clarence Elliott.*

PLANT NOTE.

A WHITE MIMULUS.

One of the loveliest plants that has flowered with me this year is a pure white variety of Mimulus Lewisii. Mimulus Lewisii (syn. M. roseus) is a North American species, which I have grown on and off for a good many years, and a very pretty plant it is, with its clumps of many, twelve-inch stems, and heads of large rose-coloured, monkey flowers. The white variety came to me this spring from a garden in the far West of Ireland, and it has been in flower now for several weeks.

It is an exact counterpart of the ordinary M. Lewisii, but with blossoms of a clear, pure, shining white, and really a most lovely thing. I have found it easy to increase from cuttings, and already the young plants, struck this summer, are flowering freely. *Clarence Elliott.*

BOKHARA CLOVER.

"An unprecedented wonder crop, which contains the secret of England's independence of foreign meat supplies, and may change the course of Britain's economic history."—"Will yield ten times the bulk of ordinary clover, and, ton for ton, its feeding value is many times greater."—"Is called American Sweet Clover, or Bokhara Clover (Melilotus alba); it is like Lucerne, but has a white bloom resembling white Heather."—"It brings to the sweet English countryside a new perfume, rare, rich, and tonicky, not unlike the finer brands of Eau de Cologne."—"Bokhara Clover as a perfume would win every woman's heart."

The foregoing selection of a few of the most salient points in a front-page article in one of the London daily papers warns us that the "big-Gooseberry" season has arrived; for if the facts stated above can be substantiated, the millennium, as it affects the agricultural industry, is very near at hand.

A friend who is a Clover-seed expert of many years' standing has recently inspected the growing crop referred to, and states that so far as the crop is concerned the description of abnormal height—8 feet—is quite correct.

It is, however, very doubtful whether cattle will take kindly to this Clover, even if it be grown on a rich soil, while if grown on poor, hungry land, such as is described in the article referred to, it is certain that the long, stalky, wiry, indigestible plant cannot possibly be good for cattle. Even if the taste and smell were attractive, the wiry stalks would need to be thoroughly crushed before the crop could be masticated by sheep or cows. If cut for hay when about the same height as Lucerne, it might be a little more digestible, but the crop would be comparatively light. So far as perfume is concerned, it is quite pleasant both in plant and seed.

There is nothing new about the plant; for more than half a century it has been grown in America, France, Germany and other European countries. In Germany especially it is grown extensively for bees. If allowed to run wild, it spreads very rapidly and is a very attractive plant in hedgerows or by the wayside. Bee-keepers should always have a plot of it in their gardens, but farmers, unless their land will not grow anything better, will be well advised to let it alone.

If a forage plant possessing the hardiness of the Bokhara Clover, the free and attractive growth of the Egyptian Berseem, and the wealth of nutritious foliage and the persistence of Lucerne could be discovered or developed, a solid boon would be conferred on agriculture from which all mankind would benefit. *S. B. D.*

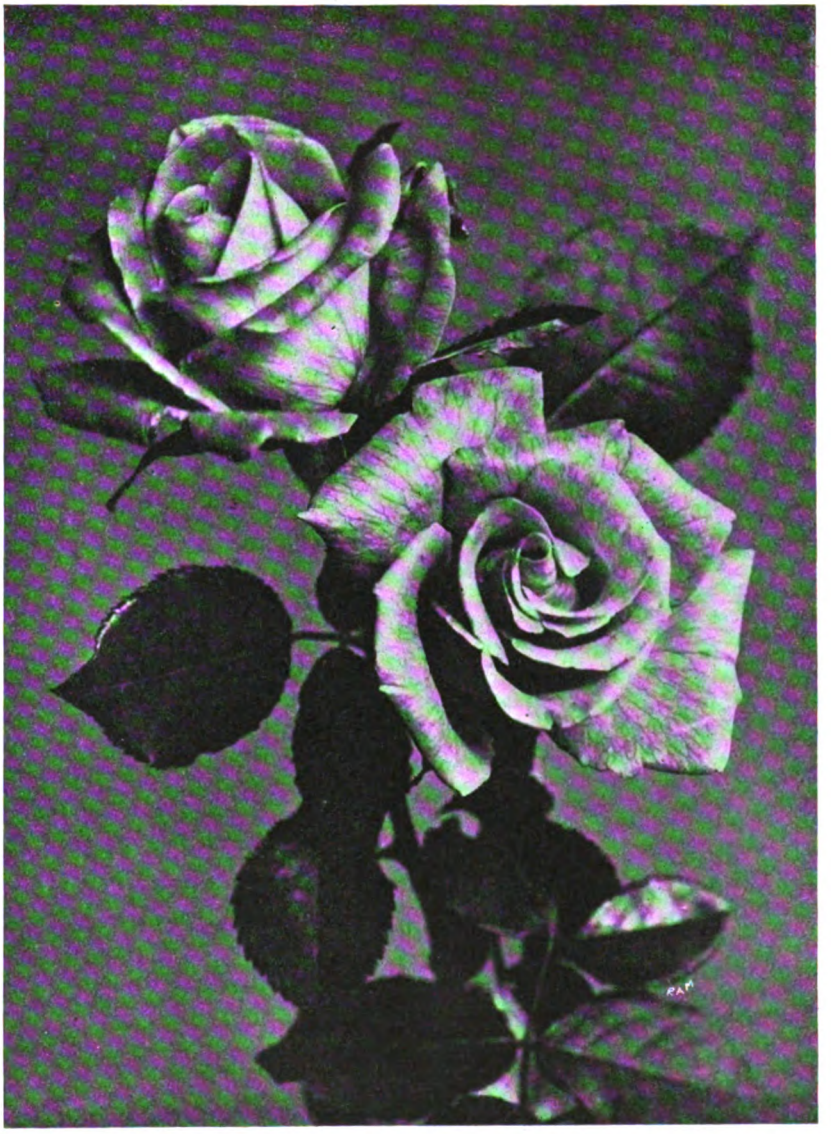

FIG. 31.—ROSE SUNSTAR: AWARDED A GOLD MEDAL AT THE INTERNATIONAL ROSE TRIALS AT BAGATELLE. (SEE PAGE 86.)

Grease-Banding Trials at the R.H.S. Gardens.—The Royal Horticultural Society will carry out a trial of materials for grease-banding in its experimental gardens at Wisley during the coming season. Materials for the trial are invited, and should reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey, on or before September 15, 1923.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters, and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

POPLARS AND THEIR CULTIVATION.

THE *Bulletin* on "Poplars"* just issued by the Forestry Commission is certainly the best account of the genus from the point of view of the cultivator that has yet appeared. The main advantage claimed for the cultivation of Poplars is the production of timber of large dimensions in a comparatively short period of years. A considerable number of hybrids have originated amongst Poplars from time to time, and some of these are used for economic planting on account of their remarkably vigorous growth. It is doubtful, however, whether any kind of Poplar can be profitably grown in large plantations, except under conditions rarely met with. It is true that on good alluvial land, unsuitable for other species, on account of excessive moisture in the soil, Poplars planted in large masses will produce timber in quantity.

Generally speaking, however, Poplars, which are typical light-demanding trees, yield, when planted in close formation, a small volume of timber per acre, much less than the yield per acre of trees like the Sitka Spruce and Japanese Larch, which do well in moist soils. Nevertheless, there are many situations where Poplars may be usefully employed. Road-side cultivation of Poplars, so common in France, is ideal, provided the trees be widely spaced and gradually pruned. Poplars also thrive along water courses or on the margins of fields, and are peculiarly well adapted for low-lying grassy ground, subject to spring and autumn frosts, rendering the cultivation of Conifers like Spruce inadvisable. Poplars are often employed in filling up small pieces of ground which would otherwise remain derelict, and they have been successful in reclaiming the pit mounds in the Black Country. Poplars also grow on peaty soils and on stiff clays, where other species make poor growth.

The *Bulletin* is divided into four chapters, the first of which, due to Prof. A. Henry, deals with the botanical description of the various Poplars, which are of especial interest to the forester and cultivator. This part is illustrated with two plates, showing clearly the distinctive characters of the twigs and leaves of the twelve important species and hybrids. The reader's attention may be directed to the article by the same author, which deals more fully with the origin of the valuable hybrid Black Poplars, in *Gardeners' Chronicle*, July, 1914, pages 1, 46, 66. (See also a further article in *Trans. R. Scott. Arboricultural Soc.* xxx, p. 14-27, 1916). Both these articles have illustrations, reproduced from photographs, showing the habit of the different hybrid Poplars.

Mr. W. H. Guillebaud, of the Forestry Commission, who specially investigated the growth of Poplars in the north of France, is responsible for Chapter II., which deals with the silviculture of the genus in full detail, under the headings, choice of species, propagation, planting, mixture with other species, thinning, pruning, rate of growth, yield, and rotation. Mr. Guillebaud gives good reasons for recommending as the best Poplar for ordinary conditions the so-called Black Italian Poplar (Populus serotina); but has a good word also for P. regenerata, which has made extraordinary rapid growth in plantations at Culford. He considers it well worth a more extensive trial on the better classes of soil in Southern England. P. trichocarpa, the balsam Poplar of British Columbia and Oregon, is extremely hardy and thrives in upland valleys in the Cotswolds and in Peeblesshire. Reference is also made to the extensive plantations of the common Aspen (P. tremula), recently made in Argyleshire by Messrs. Bryant and May, with the object of obtaining timber for the manufacture of matches. This enterprise will be followed with much interest, but it is doubtful if the cultivation of Aspen would ever pay the ordinary landowner.

Mr. Guillebaud's lengthy description of the methods of propagating and planting Poplars is well worth study by foresters. His remarks on pruning and thinning are based on French experience. With regard to the rate of growth and yield of the different kinds of Poplars in England, very little information is available; but notes are given of several plantations, of which we give one extract. At Brocklesby in Lincolnshire, on clay loam in a low-lying and very wet situation, a plot of Black Italian Poplar, aged 34 years, averaged 98 trees and 2,390 cubic feet (quarter-girth under bark) per acre, the average height of the trees being 84 feet and the average girth 4 feet. Although thinnings had been made from time to time, the trees were still much too dense to allow of rapid growth in girth. This plot shows the very moderate volume per acre (70 cubic feet annually) and small diameter attained in a regular plantation by Black Italian Poplar.

Dr. J. W. Munro, entomologist to the Forestry Commission, deals very fully in Chapter III. with the insects which are injurious to Poplars. His account is excellently illustrated, and the remedial measures suggested are of a practical nature. The fungous and bacterial diseases are discussed by Mr. W. E. Hiley, of Oxford.

The concluding chapter, by Mr W. H Dallimore, of Kew, on the characters and uses of Poplar timber, is very well done, and contains information of great value to the forester. Poplar wood is one of the least inflammable of home-grown timbers, and can be used in building where great strength is unnecessary; but in a close atmosphere it is liable to dry rot. Poplar wood may be used for many purposes, notably for box-boards, packing cases, flooring boards, ply-wood, bottoms of carts and trucks, tubs, dry cooperage, fence posts and rails (creosoted), matches and match boxes, wood-wool, paper pulp, strawberry baskets, brake blocks, turnery, and glass polishing.

Most of the Poplar wood used by our large manufacturers is imported; and Mr. Dallimore lays stress on the difficulty experienced in obtaining a regular supply of home-grown timber of good quality. He gives advice to foresters as to marketing separately the various kinds of Poplars. Aspen is one of the useful species, being the wood most suitable for making matches, match boxes, baskets, and wood-wool, but only the best quality timber can be used. Most of the Aspen wood used in this country is imported from northern Russia; and it would be impossible to grow it commercially in Britain, where the tree grows slowly and attains only a small size. Grey Poplar is more promising to grow, as its wood is almost as valuable as that of Aspen, entering into wheelwright's work, coach-building, floor boards, box wood, furniture and carving. Clean and moderately slow-grown wood of Grey Poplar has also been found suitable for the match industry. It is evident that Grey Poplar is one of the species that should be cultivated by us on a large scale, if possible. It will succeed as a standard over coppice on clay soils, and may be planted by the sides of roads. P. trichocarpa has been found suitable for pit-props, and thinnings of this species might be profitably used for this purpose. The ordinary hybrid Black Poplars yield wood excellent for cutting into veneer for plywood or as a base for fancy cabinet woods.

In conclusion, the Forestry Commission may be congratulated on the issue of this *Bulletin*, which deserves to be widely read by landowners and foresters. *A. H.*

NEW ROSES AT BAGATELLE.

THE International Jury appointed to make awards to the new Roses planted in the Bagatelle Gardens, Paris, met in June. The members were largely selected from leading Rose growers in France, England, Ireland, Holland, Luxembourg and the United States of America. M. Cherioux, Chief Counsel of Paris, President of the third Committee of the Conseil Municipal (Avenues and Parks), was appointed President, and Mr. Alex. Dickson Vice-President of the Jury.

The Rose trees presented very superior growth to that of the previous years, and did great credit to the management. No doubt the renewing of the soil in the beds in which the trees of the 1923 varieties were planted was largely responsible for this satisfactory condition of the plants, most of which were in excellent growth, while blooms were fairly abundant. Only a few of the varieties under trial were not yet in bloom, and these were planted late in April, but the growth was good, and no doubt satisfactory flowers will be produced later. The growth of the bushes planted in the autumn of 1921, and spring of 1922, showed a very great improvement over the growth of the previous year, and reflected great credit on M. Forrestier and his staff. Personally, I was very glad to observe the great improvement effected, which now admits of a more satisfactory trial.

Gold Medals and Certificates are awarded after two years' inspection. One Gold Medal and a Certificate is given to the best French productions, and similar awards to those other than of French origin.

In the 1922 class, there were 42 varieties under trial. After an exhaustive examination, nine points out of a possible ten were given to the Pernetiana Rose, President Cherioux, and a similar number to the Hybrid Wichuraiana variety, Albertine. Both varieties were put to a vote, when a majority of the Jury was in favour of President Cherioux, so that M. Pernet Ducher again won the Gold Medal for the best Rose of French origin. This variety is of excellent growth and foliage, the flowers are full, of good form and carried on stiff foot stalks; colour, saffron-yellow, suffused with apricot and salmon.

A First-Class Certificate was awarded to Albertine, sent by Messrs. Barbier, Orleans; this is a valuable addition to the Hybrid Wichuraiana class, and one that will be welcomed; the growth is exceedingly vigorous and free flowering, with large glossy foliage; the flower bud is dark vermilion, and the open flower is coppery chamois inside the petal, with a reverse of bright salmon, turning to coppery pink; a quite distinct colour.

A Certificate was also awarded to M. Pernet Ducher, for Mrs. Beckwith (Pernetiana), a good grower of Buttercup-yellow colour.

The Gold Medal for a Rose other than of French origin was awarded to Messrs. Alex. Dickson and Sons, for their Sunstar (see Fig. 31, p. 85), which was in fairly good condition. A First-Class Certificate was awarded to Mr. W. Ferguson for Souv. de R. B. Ferguson, and a similar award was made to Messrs. Alex. Dickson and Sons for their Rose, Hawlmark Crimson. As these three varieties have been splendidly exhibited at British Rose shows, they are already well known to most readers. Sunstar received the Gold Medal and Souv. de R. B. Ferguson and Hawlmark Crimson each gained the Certificate of Merit from the National Rose Society.

The only other varieties of 1922 under review that attracted my attention were Amélie de Bethune (Pernet Ducher), a seedling from Mme. Edouard Herriot, which is very promising;

Digitized by Google

and General Smuts, from Mr. Van Rossem. The latter is a Hybrid Tea of excellent habit, free flowering character and cherry-red colour. Marcelle Mignot, a Hybrid Tea (Sauvagoet), is free flowering and has fairly full flowers of deep golden-yellow colour.

Among the forty-eight varieties under trial for the first time, several were interesting, including promising novelties from M. Chambard. In his set of four kinds, Madame Malleriss (Hybrid Tea) scored highest, gaining eight out of a total of ten points; the growth and habit were excellent, the variety is very free growing and free flowering, the blooms being full, with a colouring somewhat like that of General MacArthur. Odette Foussier (Hybrid Tea) was also awarded eight points, and this I was much impressed with. The colour is like that of Madame Ravary, the blooms are large, well formed and freely produced, and the growth good, with glossy foliage. Madame Emile Mayen (Hybrid Tea) was given seven points; it is lemon-yellow, moderately full, growth and habit good; foliage glossy. The fourth variety was under number 8712. It is a good grower with nice foliage, the flower is full and long pointed; shape and style of Clarice Goodacre. This also received seven points. The Rose to receive the highest points was Angele Pernet from M. Pernet Ducher; it scored nine points and is no doubt a variety of distinction, resembling, I thought, Mrs. C. V. Haworth, in colour and shape; the growth is erect, with excellent habit and foliage.

Among Roses other than of French origin, only three varieties scored over six points, John Russel (Hybrid Tea), from Messrs. Dobbie and Co., gaining eight points. This is a free growing and free blooming variety of a crimson colour, reminding one of medium-sized blooms of H. V. Machin, but it is a more vigorous grower.

America, from The E. G. Hill Co., was good in growth and form, but the colour was not equal to that seen under glass; possibly the dry and cold weather was accountable for this. Seven points were given.

Eldorado (Hybrid Tea), from Messrs. Howard and Smith, was given seven points; this is a yellow variety, but the bloom did not impress me. There are several of similar colour much superior, but with more favourable weather it may improve.

Quite a number of varieties planted late in the season were not in bloom, and amongst them Rheims, Blanche Messigny, Betty Uprichard, and Capt. Kilbee Stuart had made good growth and were carrying very good buds, which no doubt would develop good blooms later. Rheims I had the pleasure of seeing at Orleans, when visiting Messrs. Barbier. This I consider a very good Rose, useful alike for exhibition and garden purposes; the growth and foliage are good, and it is very free flowering; the outer petals are pale yellow with deep saffron centre. *Nela.*

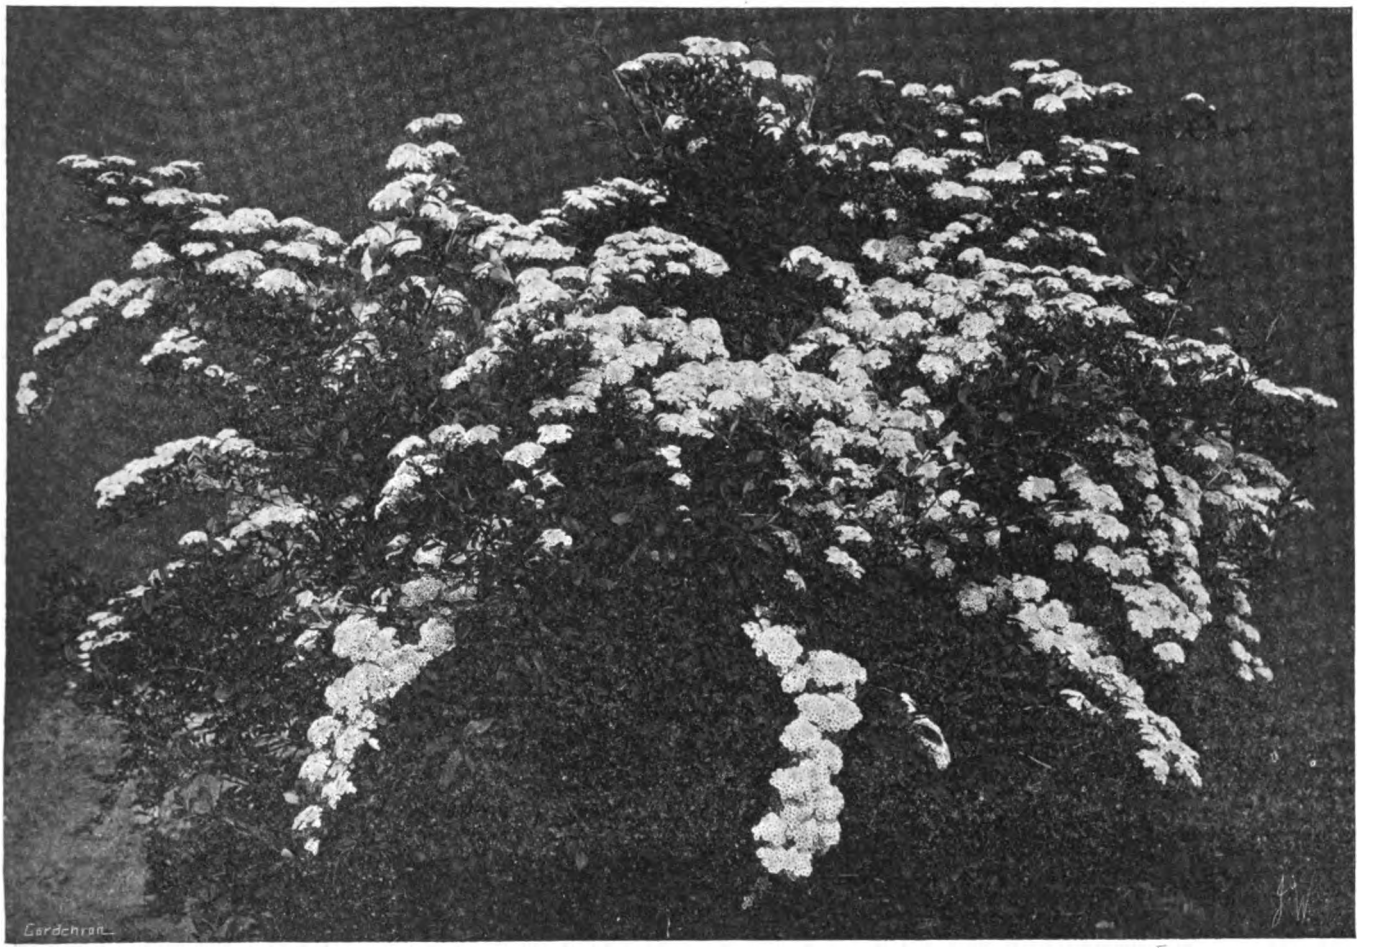

FIG. 32.—SPIRAEA TRICHOCARPA.

PLANTS NEW OR NOTEWORTHY.

SPIRAEA TRICHOCARPA.*

This new Spiraea is a first-rate shrub—in fact, one of the best of a useful if overcrowded genus of hardy, woody plants. It is a native of northern Korea, where it is a spreading bush about a yard high, but under cultivation it promises to grow to double this height. The shoots are angular, with prominent winter buds, rigid and arching, forming a compact bush. A few hairs are present on the flower-stalks and carpels, otherwise the plant is glabrous. The short-petioled leaves are grass-green above, pale below, oblanceolate to elliptic-lanceolate, from 1½ to 2½ inches long and from ½ to 1 inch wide, often broadest above the middle, narrowed to the base, with a few short teeth at and near the apex. The flowers are white, scentless, flat, above ¼ inch across, with emarginate, suborbicular petals; they are borne in rounded or dome-shape, 3 to 5 inches broad, corymbose clusters at the ends of short lateral leafy shoots. The inflorescence is compound, and each component corymb is bracteate. In many respects the plant resembles, but is superior to, the Japanese S. nipponica (better known as S. bracteata), which grows to a larger size, has differently shaped leaves and normally a simple, not a compound, inflorescence.

This new Spiraea was discovered by T. Uchiyama in 1902, and subsequently named by Dr. Nakai. It is not uncommon in northern Korea, and especially on the Diamond Mountains, where it grows alongside streams and on cliffs. It was on these mountains that I found it in the autumn of 1917, and sent seeds to the Arnold Arboretum. A good stock was raised, and this year plants have blossomed freely and shown the garden value of this acquisition. The plant has proved perfectly hardy in Massachusetts, and is as floriferous as any member of the genus. It is in full beauty of blossom when the flowers of S. Henryi are passing and before those of S. Veitchii open.

There are really too many Spiraeas in cultivation, and for garden purposes the genus needs a thorough weeding. Recent plant introduction work in the Orient has added not a few species that have no particular claims as ornamental plants, but as compensation has given us some that are really superior to any other species. The hybrid S. van Houttei is not surpassed by any Spiraea, and in eastern North America is a favourite hedge plant. It flowers early, and is followed by S. Henryi. These two, with the new S. trichocarpa and the late-flowering S. Veitchii, are, in my opinion, the finest of the true Spiraeas with white flowers. *E. H. Wilson, Arnold Arboretum, Harvard University.*

NOTES ON THE CULTIVATED PLANTS OF THE REPUBLIC OF SALVADOR.

From the middle of December, 1921, until early June, 1922, I was engaged in an investigation of the botanical features of certain portions of Central America, and spent the greater part of the time in the Republic of Salvador, with about a month in Guatemala. I have thought that it might be of interest to readers of the *Gard. Chron.* if I enumerated briefly some of the more interesting plants observed, especially those cultivated for ornament or for food.

Salvador, the smallest in area of the Central American States, has been less known botanically than any other portion of Central America, partly, no doubt, on account of its comparative inaccessibility, since it is the only one of the five Republics which does not possess an Atlantic seaboard. Because of its small extent and the fact that it lies wholly upon the Pacific watershed, its flora is not so diversified as that of the neighbouring countries. As a result of recent explorations by Dr. Salvador Calderón, of the Salvadorean Department of Agriculture, and myself, approximately 2,000 species are now known from the country, only about half as many as have been found in Costa Rica, where, however, a great deal more collecting has been done. Another factor tending to limit the number of species is the scant rainfall, the average being only about 70 inches per year, which is certainly not a large amount for a tropical country. There are two well-defined seasons, dry and wet, the latter lasting from the first of May until the end of October. During the dry season, which occupies the rest of the year, no rain whatever falls, as a rule, and consequently much of the vegetation withers quickly, some of the trees shed their leaves, and it is impossible to grow the ordinary food crops except where there is an exceptional amount of moisture, principally as supplied by irrigation.

The chief agricultural product, at least for export, is Coffee, which is grown nearly everywhere above 1,000 feet, the plantations often extending to the tops of the highest volcanoes (8,000 feet). Excepting Haiti, Salvador is the most densely populated country in the western hemisphere, and on this account there is to be found little unused land in those regions that are adapted to agriculture.

Besides Coffee, the principal crops are Maize, Rice (the upland variety), and Beans, the last chiefly of the small black variety cultivated throughout Mexico and Central America, as well as in the south-western United States. Beans and the peculiar Maize bread of the region serve as the principal food staple for all classes of people. Tobacco is cultivated extensively, likewise Sugar-cane, and some sugar is exported. Before the introduction of Coffee, Indigo was the principal export, and it is still produced in small amounts. Small quantities of rubber (Castilla gummifera) are gathered. Unique among the native products is the so-called "Peruvian" Balsam, practically the whole supply of which is collected in a limited portion of the coastal range, known as the Balsam Coast. The Balsam, the product of a Leguminous tree, Toluifera Pereirae, is used chiefly in pharmacy, and is obtained by tapping the trees, which are very tall and graceful and contain the balsam in all their parts.

Salvador has an exceptionally large number of species of trees, many of which are of special interest; and some of them seem to be of limited distribution in Central America. Such is the Tambor tree, Omphalea oleifera, described by Hemsley 40 years ago, but not collected again, apparently, until the past year. Although now known only from Salvador, it probably extends into Guatemala. Its seeds are edible, either when green or after maturity, and they yield an oil of good quality, which is used in cookery, like olive oil, and for illumination and for the manufacture of soap. Another tree of restricted distribution is Jacaratia mexicana, a relative of the Papaw, known previously only from Southern Mexico. It bears pendent fruits about a foot long and sharply 5-angled, which are edible when cooked.

Most characteristic of Salvadorean plants are the wild Figs or Amates (numerous species of Ficus), which the people term their "National Tree." They are handsome trees with widely spreading crowns of dense foliage, and in the dooryard of every country home there is almost certain to be found one of them, under whose cool shade the inhabitants carry on the greater part of their domestic activities. Scarcely less numerous are the Ceibas (Ceiba pentandra), which are the largest trees of the region, and often of enormous height and spread, with corpulent trunks supported by heavy buttresses.

One of the most remarkable of the native trees is the Palo Mulato (Triplaris americana), belonging to the Polygonaceae, a family in which ordinarily we do not expect to find trees or, indeed, showy plants of any kind. The Palo Mulato is abundant in many parts of Salvador and is often planted for shade about the fincas. It is a large tree which supplies good wood, and when in flower is a handsome object. Some individuals are pistillate and others staminate; only the former are showy, their flowers being produced in ample, panicled racemes of various shades of purplish red. Standing upon some eminence overlooking one of the interior valleys, it is possible to descry the trees at a long distance, and their abundance is so great that sometimes they lend colour to the whole landscape.

The trees forming the most imposing displays of colour are three species of Tabebuia, that are widely dispersed in Salvador. Two of these, T. chrysantha and T. Donnell-Smithii, have yellow flowers and exhibit vivid displays of colour, although as a matter of fact they are almost too gaudy to be beautiful. The other, T. pentaphylla, is one of the most attractive trees that I have ever seen. Its one fault is that the blossoms are produced when the tree is devoid of leaves, but the flowers are borne in such profusion that the absence of leaves is scarcely noticeable. In form the flowers are like those of the Catalpa, and in colour they simulate exactly the Japanese Cherries, ranging from nearly white to deep rose-pink. A large grove of the trees, exhibiting all shades of colour, or even a single individual, is a sight long to be remembered. The tree is easily grown from seeds and is highly esteemed locally for shade and for street planting.

Another native tree that furnishes a memorable colour display is the Madre de Cacao ("Cacao-mother," so named because of the fact that even among the pre-Columbian inhabitants it was recognised as being the best shade of Cacao), Gliricidia sepium, a Leguminous species closely resembling some of the locusts (Robinia), of which it is a near relative. It is probably the most common tree of Salvador, and forms almost pure stands of great extent at low and middle elevations. The pale pink blossoms drape the trees with a graceful mantle of colour, but to the writer the tree is not nearly so attractive as the pink Tabebuia.

Other common native trees are Erythrina rubrinervia, whose vivid scarlet blossoms are cooked and eaten like string beans, which they resemble in flavour; Yucca elephantipes, whose stately panicles of creamy white flowers also are utilised in the same prosaic manner; the giant Ear-tree, Enterolobium cyclocarpum, which in size equals the Ceibas, and bears curious, ear-shaped pods; Cassia grandis, which in spring is almost hidden under its profusion of pink blossoms, the tree at a short distance reminding one of an Apple tree; Schizolobium excelsum, a striking Leguminous tree, with masses of fragrant, yellow flowers, much frequented by bees; Andira jamaicensis, abundant nearly everywhere, with dark green, lustrous foliage, and covered in spring with dense panicles of violet-purple blossoms; Bombax ellipticum, one of the Silk-cotton trees, with clumsy pink or white flowers; and Calophyllum Rekoi, which is much planted for shade and makes a superior tree for avenues because of the neat and well-kept appearance of its foliage.

Aside from the growing of vegetables, horticulture is a matter which receives little systematic attention in Central America, yet everywhere there is a wealth of flowers and ornamental plants. The aboriginal natives of Mexico and Central America were noted for their love of flowers and were probably more marked in this respect than any other people of an equal state of culture. This trait seems to have been transmitted to their descendants, for poor indeed is the Salvadorean home that does not boast at least a few carefully tended plants. The ordinary type of house found in the towns is conveniently arranged for the growing of flowers. The houses are of the Spanish style, of a single story, built about a commodious central court, which is nearly always attractively planted with herbaceous plants, vines, and shrubbery, with frequently a fountain and a few Orange trees, with parrots chattering upon their perches, and birds singing in their cages. These courts or patios are a mass of colour the year long, and in the broad corridors which surround them there is always cool shade, with hammocks swung between the posts, where it is pleasant to rest during the heat of the day.

In all the towns there are public parks, and usually these are tastefully planted with Palms, especially the Royal Palm (Roystonea regia), and other trees, shrubs and flower beds. About the country dwellings there are dense groves of trees, mostly fruit-bearing, with a wide variety of shrubs. Some of the country estates possess extensive and carefully tended gardens, stocked with rare exotic plants. Such is the "finca" at Puerta de la Laguna, the property of a German family, which has assembled a large collection of unusual economic and ornamental plants from all parts of the tropics. Here are to be seen many fine Palms choice varieties of fruit trees, a glasshouse for the propagation of tender foliage plants, and unusual ornamental trees, such as Amherstia nobilis, Jacaranda filicifolia, the Cannonball tree (Couroupita guianensis), and a host of others. *Paul C. Standley, Assistant Curator, Plant Division, U.S.A. National Museum, Washington.*

(To be continued.)

RED PLANT IN STRAWBERRIES.

In his letter published in the *Gard. Chron.* of July 21, Mr. Johns appears to claim priority in the discovery of eelworm as the cause of "red plant" in Strawberries. He states that at Long Ashton one of us definitely ruled out eelworm as a causative factor.

We wish to say in reply that in the first place there was every justification at that time in refusing to accept the Tylenchus theory as, although several observers had found "eelworm" in "red plants," parasitic forms of any kind had not been seen with sufficient frequency or in numbers justifying the assigning of the cause of "red plant" to them. We emphasise Tylenchus, as Mr. Johns in his article in the *Gard. Chron.* for May 29, 1920, entitled "Silver Leaf in Plums" (!) implies that this was the genus concerned. Further study of the pathogenic potentialities and of the life history of Aphelenchus fragariae, Ritz. Bos., will possibly reveal the reasons for the fluctuation in eelworm population in infected plants, and the minimum number required to produce either "red plant" or "cauliflower."

A vague pronouncement that "eelworm" is the cause of "red plant" does not justify a claim for priority. We would like to point out to Mr. Johns that there are many species and even genera of eelworms. Free-living saprophytic forms may be found in decaying leaf bases of healthy plants, and because eelworms have been found it does not follow, in the absence of further evidence, that they are capable of initiating pathological conditions.

We are unaware of any work published by Mr. Johns in which he identifies Aphelenchus fragariae as the pathogenic organism concerned in "red plant." If, however, such work exists we regret having overlooked it, and would be glad if he would give the reference to the scientific journal in which it appeared. Mr. Johns appears to have overlooked the main point of our announcement, which is the correlation of "red plant" with "cauliflower" disease. *E. Ballard and C. L. Peren.*

TREES AND SHRUBS.

CEANOTHUS GLOIRE DE VERSAILLES.

In my opinion this is the finest of all the Ceanothuses, and although it is usually recommended as a wall shrub it will do equally well grown in a border or bed devoted to shrubs. It should not be planted in an exposed position as it is not quite hardy in a cold district. As it flowers on the current year's growth pruning is best done in March, cutting the shoots back to three eyes from the base. The strong, sturdy growths which then develop will produce their pale blue flowers during July and August all along the top half of the shoots and well above the foliage. To obtain the best effect from this shrub, several specimens should be planted in a bed on the lawn. Any old or dead wood should be cut away at pruning time, and if a little well-rotted manure is dug into the soil when pruning is finished, this will greatly help towards a fine display of bloom.

FABIANA IMBRICATA.

Although this shrub is not hardy in all parts of the country, an endeavour should be made to grow it in most gardens, as it is one of the most beautiful summer-flowering shrubs we have. It will grow six feet or eight feet high, is evergreen, and not unlike a tall, white-flowered Heath. The foliage is deep green, and the tubular, waxy flowers are clustered round the long shoots from top to bottom. Fabiana imbricata should be planted in a sheltered position, and deeply worked, rich soil, so that it will develop long, healthy growths, which, when in full bloom, make such a delightful feature. In the event of hard frosts occurring, it would be wise to protect the plants with old mats or Bracken Fern, especially when they are small, but any little trouble taken in this respect will be repaid. *R. W. T., Market Harborough.*

GENISTA AETNENSIS.

During July, when comparatively few hardy shrubs are in flower, the Mount Etna Broom is very welcome in the shrubbery borders and pleasure grounds. It forms a tall bush 12 to 20 feet or even more in height, the main stems erect, the young branchlets pendulous, teeming with small, Pea-like, golden-yellow blossoms during July.

Seeds provide a ready means of increase, and in view of some difficulty in transplanting, it is preferable to cultivate the young plants in pots until they are large enough for their permanent positions. In common with other members of the Broom family, the subject of this note thrives in sunny positions and poor soils. In the first few years of growth some pruning is desirable to form a bushy foundation, although if planted in a shrubbery the tall, "leggy" growths may be an advantage if there are other shrubs beneath.

CASTANOPSIS CHRYSOPHYLLA.

This interesting evergreen tree—the Golden-leaved Chestnut of the Oregon and California—is carrying an unusually heavy crop of fruits this summer. These resemble clusters of small Sweet Chestnuts, comprising burs, surrounded with spines, enclosing the edible nuts which germinate freely and provide a means of increase.

Though recorded as being first introduced in 1844, the Golden-leaved Chestnut has not been planted freely in Britain. In California trees exceeding 100 feet are on record. With us, at first, Castanopsis chrysophylla forms a shrubby bush, but, with attention to the leading shoot, and some thinning of the branches, it becomes in time an attractive tree. The popular name refers to the colour of the under-side of the leaves. The present abundant fruiting may be traced to the hot summer of 1921, for the flowers of 1922 produced the fruits which are maturing at the present time. *A. O., Kew.*

CHIMONANTHUS FRAGRANS IN FRUIT.

Two fine plants of the deliciously fragrant, winter-flowering Chimonanthus fragrans are fruiting freely in these gardens. Planted about fifteen years ago in light, sandy soil at the foot of a south wall, they have made good specimens, each plant covering an area of about ten square feet. They flowered exceptionally well last year, and owing to the mildness of the winter the plants remained in full beauty from December to February, when it appeared that most of the flowers had set fruit. In the pruning which followed the greater proportion of the fruits were, of course, removed, but those remaining at the base of the shoots were sufficient to produce a large crop of pods, which are well developed and now reaching maturity. *W. Auton, Pyrford Court Gardens, Woking.*

ECCENTRIC GROWTH OF STACHYURUS CHINENSIS.

I enclose a photograph of a very curiously-deformed specimen of Stachyurus chinensis growing here, which you may consider worthy of reproduction (Fig. 33). The whole of the looped part is flattened, and being of a bright red-brown colour, presents more the appearance of a bit of painted iron hurdle than of a living plant. I am too ignorant to be able to explain what has caused this eccentric growth, and perhaps one of your more learned readers may

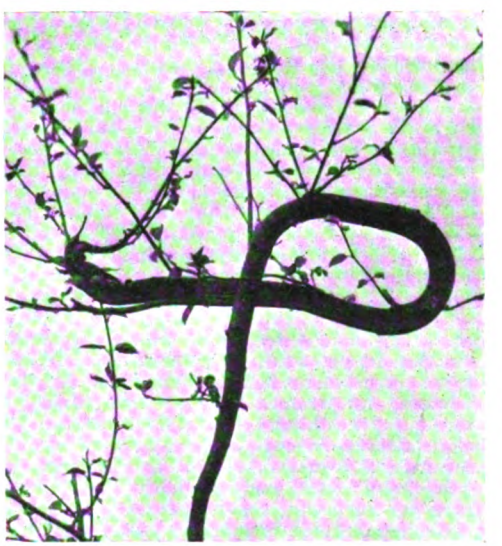

FIG. 33.—ECCENTRIC GROWTH OF STACHYURUS CHINENSIS.

be kindly disposed to throw light on the matter.

I have several other specimens of this plant, of quite normal growth, one a very large and shapely bush about five feet high by six feet across, which I bought some twenty years ago from the Yokohama Nursery Co. under the synonym of S. praecox.

The eccentric plant was raised from seed (No. 192) collected by Mr. Wilson in 1907 in the ravines of Western Hupeh, north and south of Ichang, China. In the spring of 1922 my Stachyurus flowered very freely, and when covered with yellow, hanging racemes, produced a very good effect.

I should not be disposed to insure the life of the plant whose partial portrait is here presented, and even should its life be prolonged it is more suited to a chamber of horrors than a flower garden. *Vicary Gibbs, Aldenham.*

P.S.—The plant referred to above died quite suddenly about a fortnight ago, even sooner than I had anticipated, and I have lodged it with the Natural History Museum in South Kensington, where it may be seen by those interested in curiosities of growth.

Although there are to be seen at the Museum many instances of fasciation in herbaceous plants, there are none of such malformation in woody subjects, except the one recently sent by me. It is generally recognised that fasciation is produced by an injury to the plant stem, but whether the injury is due to insects or some other cause has not been certainly determined. *V. G.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante, pp. 71-76.)

SCOTLAND, N.

Ross-shire.—The fruit crops in this district are very light when compared with the abundant crops in 1922. This is, no doubt, largely attributable to exhaustion from last year's efforts; but the climatic conditions which obtained throughout the spring months had a most detrimental effect. Part of March was very fine, but April, May and June were cold and wet months, with the wind almost continuously in the north. Frost occurred on twenty nights in April, when 8° and 9° were registered; May was little better, having eighteen nights with frost ranging from 4° to 5°. Frost appeared on six nights in June; 26° Fahr. being registered so late as the 15th of the month. These causes, no doubt, contributed largely to the shortage of this year's crops. Apples are comparatively a light crop. Pears are conspicuous by their absence. Plums, which promised well when in flower, have set only half a crop. Small fruits are fairly good, particularly Gooseberries, Currants and Raspberries. Strawberries are under the average, and Cherries very much so. The past winter was so very open and mild that some Pear trees were attempting to flower as early as December last. Ardross is 450 feet above sea level, and is situated in latitude 57°, 45″, longitude 4°, 21″ W. The soil is somewhat heavy, clayey loam, over a clayey marl or pan almost impervious to water. Regarding insects, aphides have been troublesome on plum trees, while Psylla pyri and P. mali, the Pear and Apple chermes, have, in some instances, had to be dislodged by summer washes. *William L. Minty, Ardross Castle Gardens, Alness.*

Sutherlandshire.—Generally speaking, the fruit crops this year are very light in quantity throughout Sutherlandshire. Owing to the cold, wet, and sunless season of 1922, the wood did not ripen, and this, coupled with a cold and wet April and May this year, provided conditions inimical to the Apple, Plum and Cherry crops. Currants, both red and black, and also Raspberries, show average crops. Strawberries promise to be an exceptionally heavy crop. At Dunrobin we have about a quarter of an acre of Elton Pine Strawberry, and the plants were just passing out of flower on July 5. The soil is of a sandy nature, with a subsoil of pure sand. *W. F. Game, Dunrobin Gardens, Golspie.*

SCOTLAND, E.

Aberdeenshire.—All fruits, except Strawberries, carry very light crops, and these are about three weeks later than usual. Two years ago the season was so good and the fruit buds ripened so well that last year there was a superabundance of most kinds of fruits, and I consider the consequent exhaustion to be the principal cause of the shortage this year. *James Grant, Rothienorman Gardens, Aberdeen.*

Banffshire.—Stone fruits are a failure in this district, as the months of May and June were so cold and wet that the blossom was completely spoiled. We had 5° of frost on June 15. Strawberries and Raspberries are the only fruits yielding an average crop in this district. *George Edwards, Ballindalloch Castle Gardens.*

East Lothian.—Plums were the only kind of the large fruits that blossomed well, but only one tree has a fair crop. There is a fair sprinkling of Apricots, which promise better than any other kind of fruit. Of Pears and Apples there are scarcely any. With the exception of Gooseberries small fruits are fairly good, Raspberries, perhaps, excepted. Strawberries, if given rain, will turn out well; I have never seen them look better. I should add that Brown Turkey Fig trees are carrying a good crop. The season has been remarkable for the paucity of flower on trees and for lateness generally. *R. P. Brotherston, Tyninghame Gardens, Prestonkirk.*

Forfarshire.—Fruit prospects are very moderate in this district, with the exception of Apples and Plums, which have poor crops. Apples did not blossom well, and the Plum blossom suffered as a result of late frosts, which

Digitized by Google

were very prevalent at their time of blooming. Raspberries carry an exceptional crop, also Red Currants, but Black Currants cropped moderately; Strawberries are of good quality. Insects pests are less numerous this year, and Gooseberry mildew is very slight; the bushes here were dusted heavily with fresh lime just after flowering, and this seems to have been a very effective preventive of mildew. Our soil is of medium texture, and inclined to be cold. *J. B. Peffers, Panmure Gardens, Carnoustie.*

Kincardineshire.—In this district the weather during the end of April and all through May was very dull and cold, and therefore distinctly detrimental to the setting of Apple and Pear blossom. Plums are a complete failure, which I think is the result of the very heavy crops carried last year. Strawberries are more promising than they have been here for several years past. Red Currants are looking very well; Black Currants set a fine crop, but the cold northerly winds at the end of May reduced the crop almost by one half. Raspberries look very promising, but none of the above-mentioned small fruits are near ripe at the time of writing (July 20), and will be almost three weeks later than usual. *William Thomson, Ury Gardens, Stonehaven.*

Perthshire.—Apple, Plum and Pear crops are, with few exceptions, a failure here. Currants, Gooseberries, Strawberries and Raspberries are carrying full average crops, and, though late, give promise of ripening well. Cherries, on the other hand, are an average crop, but of poor quality. Plums flowered profusely, but owing to the cold, frosty wind prevailing at the time, failed to set satisfactorily. Apple blossom was weak, and in some cases did not develop properly, with the result that only the most robust varieties set a few fruits. Insect pests have been troublesome, green fly being most persistent on Plum trees against walls, but the trees are now making satisfactory growth. *Malcolm Macnaughton, Scone Palace Gardens, Perth.*

——The fruit crops will be poor in Scotland this year. Owing to the cold, sunless, dry, summer of 1922, and the cold, dry north winds experienced from February of this year to the middle of June, all fruits are from three to four weeks late, therefore it is too early (mid-July) to write of the quality. As we had no "late summer" last year, the Apples and Plums which make such a great show in the early summer, were flavourless in the autumn. *Chas. Crighton, Jordanstone House Gardens, Meigle.*

——Peach and Plum trees have suffered from cold winds, and blister is prevalent. Peach and Apricot crops are very poor. Raspberries are promising well, but young canes are short, owing to the lack of rain. *James McGregor, Rossie Priory Gardens, Inchture.*

SCOTLAND, W.

Ayrshire.—This is a disappointing season, following a good show of blossom. Plum and Pear trees dropped their fruits badly owing to a continuation of very cold winds in May and well into June. Apples, in sheltered positions, carry a fair crop, especially James Grieve, Worcester Pearmain, and Lord Grosvenor. *D. Buchanan, Bargany Gardens, Dailly.*

Buteshire.—As a consequence of the wet season of 1922, and the extraordinary cold weather early this year, fruit crops generally in this district are very poor; indeed, with the exception of Gooseberries, Currants and Strawberries they are quite a failure here. The weather up to the end of June was the worst I ever remember for gardening; everything is quite a month behind its usual time. Our land is heavy loam on marl. *John J. Davidson, Ardencraig Gardens, Rothesay.*

Dumbartonshire.—Crops of small fruits are very good, with the exception of Currants, which are rather under the average. Apples and Pears, while good, are not plentiful. Plums carry a very poor crop. *John Brown, Cairndhu Gardens, Helensburgh.*

Dumfriesshire.—Black and Red Currants, Gooseberries and Strawberries have crops over the average. Raspberries are poor. Apples carry a very small crop, and Pears are no better. All crops are very late. Our soil is sandy loam over gravel, and needs a considerable amount of manure. Potatos are yielding a fair crop, and the tubers are of good quality, but two weeks late as compared with most years. Other vegetables are good, but Cauliflowers are small. *James Macdonald, Dryfeholme Gardens, Lockerbie.*

(*To be continued.*)

HARDY FRUIT GARDEN.

OBSERVATIONS ON SOFT AND STONE FRUITS.

During the past few years, and especially during the war, it was impossible to exercise a proper control in the selection of many fruit trees, with the result that in some cases stocks of specified varieties have not been at all true and have contained a very large proportion of rogues.

Raspberries.

The above remarks apply especially to some of the older varieties of Raspberries, but there is no confusion as yet amongst the newer varieties, such as Lloyd George, Pyne's Royal or Red Cross. Amongst varieties of considerable merit might be included the following, namely: (1) Lloyd George, which was found as a wild seedling in a wood in Dorsetshire, and was introduced by Mr. J. J. Kettle, of Corfe Mullen. This variety, growing in my garden at Effingham in a heavy loam overlying yellow clay, bears fruit until the leaves fall in the autumn. The individual fruits are very large and hang well. This variety also does equally well on sandy soil at Dorking, where the new canes this season are already quite 5 feet in height; (2) Pyne's Royal, which was raised by Mr. Pyne, of Topsham, and introduced in 1913; (3) Devon; (4) Antwerp Black; (5) Bath's Perfection, which is generally considered to be identical with Laxton's Abundance; (6) Baumforth's Seedling; (7) Norwich Wonder; (8) Semper Fidelis: this variety is very popular amongst jam makers, as the jam manufactured from it is invariably of a good colour, and is remarkable for its clearness; (9) Superlative: this variety, when true, is still excellent in every respect, but in certain soils it has deteriorated considerably in recent years, and the growth does not appear to be so strong as it was. It is, however, one of those varieties which very often do exceedingly well when planted on a clay or heavy loam soil; (10) Red Cross: this variety does better on light and poor soils than on heavy loams, and in the summer of 1921 was found to be fairly resistant to drought.

The autumn-fruiting varieties are not sufficiently well known, and this is a pity, as what could be more highly esteemed than a dish of ripe raspberries in late September or early October? The canes should be cut down to the ground each spring, as the autumn-fruiting varieties bear on the growths of the current year. Hailsham is a fine variety of this type.

Strawberries.

In the case of the Strawberry it has been found that the anthers come to maturity later than the stigmas. Experiments have been carried out with a view to ascertaining whether insect fertilisation is absolutely essential, and, where the plants have been covered over with fine muslin with a view to excluding all insects, it has nevertheless been found that the plants cropped quite heavily. Large numbers of new varieties have been raised during recent years, but, for general garden purposes, the two best varieties still in commerce are Royal Sovereign and Sir Joseph Paxton. Laxton's new Strawberry, The Duke, is well spoken of by those who are growing it, and readers should certainly try a small bed of this variety. It was highly recommended by the R.H.S. after the trials of Strawberries which were carried out during 1920-21 at the Wisley Gardens. The berries are large, of a bright scarlet colour, and they ripen a few days before those of Royal Sovereign. It is a variety which should do very well on light soils as well as on richer loams.

Gooseberries.

In the case of the Gooseberry self-pollination seldom takes place. This is due to the fact that the flowers in nearly all varieties hang down in a perpendicular manner, and, when they open, the anthers at once dehisce and commence to shed their pollen. When this occurs, it will be found in most varieties that the styles are still growing, and that the stigmas are not sufficiently advanced for successful pollination to take place. Luckily, however, a very large number of insects visit these flowers, and, as a rule, the Gooseberry is, therefore, fairly regular in its cropping. Possibly the best varieties would be Lancashire Lad (early picking), Warrington (for preserving), Whinham's Industry (for bottling), and Lancer and Whitesmith (dessert).

Red Currants.

In the case of the Red Currant, the stigmas and stamens generally mature at the same time as the flower opens, and, although self-pollination is the exception rather than the rule, heavy crops generally result owing to the fact that the flowers are visited by a large number of insects. The best varieties for garden cultivation include:—

(1) Raby Castle: this sort bears trusses of bright red fruit, and is late in ripening; (2) Scotch: this variety is largely grown for market on account of its bright colour and early ripening. It is equally good for the small garden (3) Versailles: a mid-season variety; (4) Fay's Prolific: this is a very valuable early Currant; (5) La Constante; (6) Perfection (Laxton).

The last two varieties are late croppers.

Plums.

It will be found that the anthers and the stigmas of Plums mature about the same time. The inner stamens are at a lower level than the stigmas; but the outer ones are, as a rule, the same height as the stigmas. Most varieties of Plums flower about the same time, and remain in bloom from fourteen to twenty-four days, with the result that successful cross-pollination generally takes place when any distinct varieties are planted fairly closely together. It has been found, however, by various observers that the Coe varieties of Plums will not cross with Jefferson; neither will President cross with Late Orange. Large numbers of varieties are entirely self-sterile, and amongst those classified under this heading are the following:—Coe's Golden Drop, Grand Duke, Jefferson, Kirke's Blue, Late Orange, Late Transparent Gage, Pond's Seedling, Transparent Gage, Washington, and Comte d'Althan's Gage. Varieties which are partly self-fertile include Rivers' Early Prolific, President, Stint and Prince Engelbert, while self-fertile varieties are Monarch, Denniston's Superb, The Czar, Victoria and Pershore. *Enthusiast.*

(*To be concluded.*)

MARKET FRUIT GARDEN.

July opened with a spell of ideal summer weather, but this was effectually broken by the great storm of the 9th. During the five or six hours of the storm the rainfall amounted to 2.44 in., which greatly exceeds any fall I have previously measured in twenty-four hours. Beyond hammering down the soil and splashing mud on to bush fruits, no harm was done. After the storm the weather remained unsettled and showery, bringing the total rainfall for the month up to 3.63 in., which is much above the average for July. As many other districts were suffering from drought, I may perhaps be considered lucky. Certainly the warmth and moisture produced rapid growth, so that fruit trees which looked very sickly at the end of June greatly improved in appearance. But the fruit did not swell as might have been expected, probably owing to cool nights. Apples still look like being small, especially the early varieties. The growth of weeds and grass on the headlands was tremendous, and much of the work of the month consisted in dealing with them.

Digitized by Google

BUSH FRUITS.

The only crop marketed during July was Black Currants. These did not yield well, owing to the prevalence of reversion, to which reference was made last month (see p. 24). When marking the reverted bushes to be grubbed, I found that the situation was worse than I expected. Five or six acres are too badly affected to be worth tinkering with, and must be grubbed entirely. Here I shall plant Gooseberries and Red Currants. I shall be glad to have Gooseberries again, as they bring in a return early in the season. Their culture was given up when American mildew was so virulent. This disease is now less serious, and can be controlled to some extent. I am advised, however, that it is not wise to plant any varieties but those which are fairly resistant to mildew. Careless is largely grown for market for this reason, but this is a weak grower, so I am not much drawn to it. In my private garden Whitesmith never suffers from mildew, though other varieties are sometimes affected. I should be glad to know if this is the common experience of growers, or if any other varieties can be recommended as resistant.

As for Red Currants, I have never grown these for market, as they used to be so cheap; but in recent years they have sold fairly well. If they yield as well in the field as they do in my garden, they should pay almost as well as Black Currants, as they are more regular in bearing and cheaper to pick. The varieties thought of are Skinner's Early, which is much grown in Kent, and Laxton's Perfection.

KILLING INSECT EGGS.

Growers naturally long for a wash that could be sprayed on to the trees during the winter to kill all insect eggs, and so avoid trouble from pests during the growing season. Last winter a new wash of Continental origin was rather freely tried by growers, and favourable reports of the results of its use have been published. In some cases trees treated with it are said to have been quite free from insects this season. Aphis eggs in particular are said to have been killed, being found unhatched on the trees in early summer. As these claims go even beyond those made by the makers of the wash, there can be no harm in warning growers not to place too much confidence in them. They are made in good faith, but it is so easy to be mistaken in fruit-growing. Exactly the same claims have been made before, notably for lime-sulphur. Who still believes that winter spraying with lime-sulphur prevents aphis attacks by killing the eggs? The finding of unhatched eggs is no proof, for a large proportion of these eggs are always infertile. There is only too good reason to fear that we shall never find a wash strong enough to act on the shell of an aphis egg without killing the tree.

FERTILISERS.

August is the month for applying fertilisers with the object of feeding the fruit buds for the next year's crop. I shall do little of it this season, if any, not because I have lost faith in it, but because most of the trees are making so much growth that I dare not give any more manure at present. Moreover, they are carrying a light crop, so that they should bloom well next year in any case. I have yet to prove definitely the value of this early autumn feeding, but there are cases where it appears to have overcome the biennial bearing habit to a considerable extent. The fact that crops are light this year does not discourage me. In spite of heavy crops last year, there was plenty of bloom this season, and much of it set. A large proportion of the fruit has been lost since through bad weather, insect pests, and fungous diseases, and not through lack of nourishment.

With regard to manures used last winter and spring, wool shoddy has again made its mark, and meat meal has proved itself to be a splendid manure for bush fruits. Nitrate of soda, applied to trees in grass in January, has forced growth on trees which had made none for years, notably some Lane's Prince Albert, which appeared to be permanently dwarfed.

THE MARKETING SYSTEM.

All growers should read the Interim Report of the Departmental Committee on Distribution and Prices of Fruit and Vegetables, because it gives the most complete account of our complicated marketing system that has ever been published. It is to be hoped, also, that they will accept the suggestion of the committee and press for legislation requiring commission salesmen to act under licence, to be issued only under certain conditions respecting commission charges and business methods. The straightforward and reliable salesmen would no doubt welcome this as much as the growers, because it would put some check on the discreditable practices of the "black sheep" of the industry. These practices are exposed in the report. They include the averaging of prices, which may please the bad packer but robs the grower who packs honestly and well of his just reward. Worse than this is the habit of some salesmen, when the market is rising, of selling the produce to themselves and holding it for a rise. These and other tricks would become more risky if the salesman acted under a licence. *Market Grower.*

HOME CORRESPONDENCE.

Lachenalias.—*T. D. T.* (p. 60) seems to be unaware of the height of the best modern varieties when he writes that their flowers "resemble pendulous bells set round a stout stalk, which is some six to eight inches high." I herewith give the heights of some I grow, taken from my 1920 book, *e.g.*, Rosemary, 12 inches; Pegu, 12 inches; Siam, 9 inches; Japan, 10 inches; Africa, 12 inches; Thibet, 10½ inches; Riga, 9 inches; and Monte Carlo, 9 inches. In 1921, which was about my best year, I had plenty of spikes 15 inches high, and a few so much as 17½ inches. *T. D. T.* also states, "the colour *is* generally of a greenish-yellow shade." If he had written *was*, it would have been nearer the mark. I can produce any number of varieties in which there is no trace of green in the yellow. As a matter of fact, I like the green as a welcome contrast to the yellow, and I never could bring myself to try to do away with it like Sir Frederick Moore did, when he grew them at Glasnevin, and laid the foundation for the present-day varieties. Tipperary, in the cold frame here, was a revelation to me, when it bloomed in March this year; Greenland and Cork are two more of the "greeny" varieties. As a contrast there are Siam and Africa, wholly yellow and orange. The advice to put from four to six bulbs in a six inch pot is very different from my own practice. We never use pots if we can help it—always pans of different sizes. In a six-inch pan we put seven or eight first-size bulbs. With only four, the effect would be anything but happy. I quite agree with your correspondent about growing Lachenalias in windows. One of the most effective pans I ever saw was grown entirely in a farm-house window. *Joseph. Jacob.*

Olearia nummularifolia.—In my note on the Daisy Bushes (p. 57), I did this species injustice by stating it was not flowering this season. At the time of writing it had not begun to flower; but now—July 30—it is well out. It never flowers so profusely as several other species; in spite of which it happens to be the only species whereof I have found self-sown seedlings. *Herbert Maxwell, Monreith.*

Red Spider and Pear Mite on Wall Pear Trees.—I wonder if other growers have had the same experience as I have with red spider and Pear mite on wall Pear trees? For years I tried to exterminate these pests, but with very little success; once or twice I almost defoliated a tree in endeavouring to get rid of the Pear mite. The eradication of red spider was also fairly hopeless in a dry season, but now, since using arsenate of lead in the spray, the Pear trees are practically clear of both pests. The spray consisted of soft soap, Quassia and arsenate of lead. *J. D. Colledge, Cobham Hall Gardens, Cobham, Kent.*

SOCIETIES.

BIRMINGHAM HORTICULTURAL.

THE quality of the exhibits at this Society's recent annual show held in the Victoria Park, Handsworth, was well up to the average, and the number of entries appeared to be in excess of those of previous years. Although the season has been so very trying for garden produce, Roses and Carnations were shown in splendid condition, and hardy herbaceous flowers were well represented. Of indoor plants the group of Hippeastrums from J. A. KENRICK, Esq., Edgbaston, was a great cultural achievement.

GROUPS AND PLANTS.

Messrs. J. CYPHER AND SONS, Cheltenham; Sir George H. KENRICK, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), and Mr. W. R. MANNING, Dudley, were the contestants in the chief class, which was for a group of miscellaneous plants in or out of flower, arranged on a space of 16 feet by 12 feet. The awards were made in the order named. All three exhibitors worked on very much the same lines, each group being spanned by the very familiar rustic arch, with a graceful Palm to mark the highest point, and surrounded by a variety of choice subjects.

Messrs. CYPHER'S group was the best arranged and contained a greater variety of flowering plants than the others, these being, principally, Orchids, Ixoras, Clerodendrons, Liliums, Francoas and tall, graceful specimens of Humea elegans.

The best oval-shaped group of one kind of flowering plants exhibited on a ground space of 7 feet by 5 feet, came from J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), who had a splendid lot of large-flowered substantial-petalled Hippeastrums; 2nd, Messrs. J. CYPHER AND SONS, with Clerodendrons.

Mr. E. J. KEELING, Small Heath, had the winning exhibit of six Coleus, and T. BARLOW, Esq., Handsworth (gr. Mr. J. Davis), beat the last-named exhibitor in a class for six Fuchsias, with large, pyramidal-shaped, profusely-flowered specimens

CUT FLOWERS.

There were twelve very fine dinner table exhibits, each 8 feet by 4 feet, decorated with flowers. 1st, W. J. GRESSON, Esq., Stoke Severn, Worcester (gr. Mr. T. Parry), last year's winner, whose flowers included Gloriosa, Masdevallias, Calceolaria Clibrani, Francoas, Humea elegans and sprays of Selaginella; 2nd, Sir GEORGE H. KENRICK (gr. Mr. J. V. Macdonald), who relied upon Javanese Rhododendrons, Gloriosas and Selaginella; 3rd, Mrs. E. REEVE, Balsall Heath, who used Roses, Francoa sprays, and Asparagus.

In the table decoration class reserved for ladies, Mrs. A. E. ANDERSON, Shirley, took the lead with Roses, Francoa and Selaginella; 2nd, Miss D. HOLDER, Erdington, who had Sweet Peas and very pale pink Carnations.

The best of seven epergnes of flowers also came from Mrs. ANDERSON; 2nd, Mrs. WREN, Harborne.

ROSES.

The principal class in this section was for a collection of flowers arranged on a space of 20 feet by 5 feet, for which a silver challenge bowl, value twenty guineas, presented by Mr. Pat Collins, M.P., and accompanied by £15 in cash, was offered as first prize. This award was well won by Messrs. GUNN AND SONS, Olton, whose bold masses of blooms included such varieties as Flame of Fire, Ariel, Ethel James, Lady Pirrie, Padre, Emma Wright and Sunstar. At intervals the group was relieved by tall pillars of Mrs. Henry Morse, Queen Alexandra, Independence Day, etc.; 2nd, Mr. JOHN MATTOCK, Oxford, whose well set-up exhibit lacked something of variety and quality; 3rd, Messrs. JOHN JEFFERIES AND SON, Cirencester.

The best dozen bunches of distinct garden Roses came from Messrs. S. MCGREDY AND SONS, Portadown, whose vases of Vesuvius, Golden Emblem, Miss Willmott, Isobel and Queen Alexandra were much admired; 2nd, Mr. JOHN MATTOCK; 3rd, Messrs. JOHN JEFFERIES AND SON.

Digitized by Google

Mr. John Mattock excelled in the class for a bowl of Roses, Mrs. E. Reeve, Balsall Heath, being second prize winner. Mr. Henry Drew, Longworth, won first prizes for (1) 24 Roses, distinct, and (2) 18 Roses, distinct. His best blooms were of Mrs. G. Marriott, Mrs. John Laing, George Dickson, Avoca, Snow Queen and H. V. Machin. Mr. John Mattock was placed second in each class.

The judges experienced much difficulty in finding the difference between two excellent exhibits of a dozen Tea Roses, in not fewer than six varieties, staged by Mrs. Henry Balfour, Headington (gr. Mr. A. E. Hewlett), and Mr. Henry Drew respectively; the 1st prize was awarded to Mrs. Balfour, whose flowers of Comtesse de Nadaillac, Mrs. Campbell Hall and Maman Cochet were exquisitely beautiful; 2nd, Mr. Drew, whose best blooms were of Mme. Constant Soupert, Mrs. Foley Hobbs and Mrs. Campbell Hall.

Competition in the five classes reserved for Carnations was very satisfactory, there being four excellent entries for 12 selfs, dissimilar, in which Messrs. Lowe and Gibson, Crawley Down, Sussex, excelled with particularly good blooms of Zulu, Glamour, Veldfire, Bookham White, Miss Rose Josephs, Elaine, Bookham Rose, D. R. Crawford, Yvonne Thomas, Peach Blossom, Gordon Douglas and Salmonea; 2nd, The Crompton Nurseries, King's Norton, whose specimens of Elaine and Bookham White were of outstanding merit; 3rd, Mr. H. Woolman, Shirley.

The best twelve yellow-ground, fancy, Carnations were also exhibited by Messrs. Lowe and Gibson, who set up remarkably good blooms of Pasquin, Centurion, Linkman, Sheila Gibson, Enid Lowe and Lieut. Shackleton; 2nd, The Crompton Nurseries, who had Frank Woodward in splendid condition.

The best of four exhibits in a class for a dozen Fancy Carnations came from The Crompton Nurseries, whose examples of Captain, Melton, Firefly and Joseph Reeves were uncommonly good; 2nd, Mr. P. Smith. The Crompton Nurseries again led in a class for twelve white-ground Picotees, with rather small but nicely developed flowers, and in the next class, for twelve yellow-ground Picotees, they were the only exhibitors, but were deservedly awarded first prize.

Messrs. E. W. King and Co., Coggeshall, had the best display of Sweet Peas covering a table space of 20 feet by 4 feet. The flowers were arranged in baskets, vases and pans, relieved with Selaginella, and made a very imposing exhibit; 2nd, W. E. Warden, Esq., Earlswood (gr. Mr. H. Hodson).

The Silver Cup and £3 offered as first prize for twenty-four bunches of Sweet Peas in not fewer than twelve varieties was won by Mrs. Russell, Barton Court, Canterbury (gr. Mr. C. H. Rundle).

Of the four exhibits in the class for hardy border flowers Mr. Maurice Prichard, Christchurch, was placed first with a bright display in which Coreopsis, Kniphofias, Astilbe rivularis, Platycodon pallidum and Poterium obtusum were the pick of a good lot; 2nd, The Chalk Hill Nurseries, Reading; 3rd, Messrs. Thos. B. Grove and Sons, Sutton Coldfield.

The winning exhibit of a dozen trusses of Zonal Pelargoniums was staged by The Chalk Hill Nurseries, and Mr. H. J. Milner, Handsworth, showed the best 12 vases of Violas. The Crompton Nurseries were the only exhibitors in the class for a display of Violas.

Messrs. Gunn and Sons, Olton, won the Silver Cup offered for a display of hardy border flowers. They showed large masses of Phloxes, Delphiniums, Lupins, Galegas and Gladiolus; 2nd, Mr. M. Prichard, whose examples of Kniphofias and Hemerocallis were particularly good; 3rd, Chalk Hill Nurseries.

Fruit and Vegetables.

Fruit was not extensively shown. The most successful exhibitors were Mr. J. Jones (Black Currants), Mr. W. J. Gresson (Red Currants), Mr. H. Watson Smith (Gooseberries), Mr. T. C. V. Garlick (Strawberries), and Mr. F. Barlow (Loganberries).

Amateurs' Exhibits.

The most attractive display of cut flowers was exhibited by G. Marriott, Esq., Carlton, Notts (gr. W. Lamb), who was awarded first prize; 2nd, H. Watson Smith, Esq., Stourbridge (gr. Mr. H. Davis); 3rd, E. J. Keeling, Esq., Small Heath. Of the five exhibits of 18 Roses, distinct, Captain W. Jarratt Thorpe, Hucclecote, Gloucester (gr. Mr. T. Bircher), was placed first with an even lot of good quality blooms; 2nd, Mrs. H. Balfour. C. B. Worsey, Esq., Edgbaston (gr. Mr. A. Davis), led in a class for 12 Roses, distinct, followed by Mrs. Constance E. Whitcombe, Bewdley, and Captain W. Jarratt Thorpe, who were placed second and third respectively. The last-named exhibitor excelled in the smaller class for 6 Roses, distinct; 2nd, Mrs. H. Balfour; 3rd, C. B. Worsey, Esq. F. Bayliss, Esq., Walsall (gr. Mr. J. C. White), showed the best lot of 12 Border Carnations, and Miss Russell won first prize for 12 varieties of Sweet Peas.

First prizes were awarded to J. A. Kenrick, Esq., for (1) a group of plants, (2) three Ferns, and (3) 12 Streptocarpus; B. Goodman, Esq. (gr. Mr. A. Edney), for Gloxinias; F. Barlow, Esq., Handsworth (gr. Mr. J. Davis), for Begonias; E. J. Keeling, Esq., Small Heath, for a collection of Ferns; Sir George H. Kenrick, for (1) 6 table plants and (2) 12 flowering plants; and W. J. Gresson, Esq., for vegetables.

Non-Competitive.

The *Silver Cup* offered for the best trade exhibit in the show was won by Mr. C. Engelmann, Saffron Walden, for a wonderful display of Carnations.

Large Gold Medal.—To Messrs. Bakers, Wolverhampton, for a model terraced garden and a border planted with hardy flowers; to Messrs. S. McGredy and Son, Portadown, for Roses; to Messrs. E. Webb and Sons, Stourbridge, for flowers, fruit and vegetables; and to Messrs. Lowe and Gibson, Crawley Down, for Carnations and Gladioli.

Gold Medal.—To Messrs. Hewitt and Co., Solihull, for Delphiniums; to Messrs. R. D. Proctor and Sons, Chesterfield, for Roses; to Mr. C. H. Herbert, Acocks Green, for Pinks; to Messrs. W. H. Simpson and Sons, Birmingham, for Antirrhinums and Delphiniums; to Mr. H. N. Ellison, West Bromwich, for Cacti; to Mr. C. Vickers, Leicester, for bouquets; and to Mr. W. Wells, Merstham, for hardy flowers.

Silver-Gilt Medal.—To Miss S. S. Thompson, Handsworth, for Cacti; and to Messrs. G. Stark and Son, Great Ryburgh, for Campanulas and Poppies.

Silver Medal.—To Mr. H. Woolman, Shirley, for Zonal Pelargoniums and Begonias; to Messrs. W. Hopwood and Sons, Cheltenham, for hardy flowers and Petunias; to Chalk Hill Nurseries, Reading, for hardy flowers; to The Crompton Nurseries, King's Norton, for Pinks; and to Mr. A. Shepherd, Hollywood, for hardy flowers.

SCOTTISH NATIONAL SWEET PEA, ROSE AND CARNATION.

The fourth annual exhibition of this Society opened in the St. Andrew's Halls, Glasgow, on Wednesday, July 25, and continued during the following day. These halls are admirably suited for such exhibitions, and Mr. John Smellie, Helensburgh, the indefatigable secretary, took full advantage of the facilities offered him. Lady Mackenzie, of Edinbarnet, gracefully performed the opening ceremony, and likewise presented the leading prizes to the winners. The entries were somewhat similar in number to those of last year, the figures being:—Sweet Peas, 263; Roses, 135; border Carnations, 27; and decorative classes, 82. The entries came from all over Scotland, and the North of Ireland, too, was capitally represented. Unfortunately, the untoward weather experienced in April, May, and well into June told somewhat against the successful production of what may be termed exhibition flowers, but withal it was a capital display, and reflected the greatest possible credit on all concerned. In the Sweet Pea classes, four were confined to nurserymen, and some particularly fine examples were staged, the premier awards going to Mr. William Rae, Ayr; Mr. John Smellie, Helensburgh; and Messrs. Torrance and Hopkins, Busby, for flowers of outstanding excellence. The finest flowers were seen, however, in the open classes. The display was very good, and that prominent and well-known exhibitor, Viscountess Cowdray, Dunecht House, Aberdeenshire (gr. Mr. William Smith), worthily gained the Burpee Cup presented by Messrs. A. Burpee and Co., Philadelphia, for the best twelve vases, distinct varieties; the gold medal for the best twenty-four varieties, distinct; and prizes for the best white variety, the best lavender, the best Picotee-edged Sweet Pea, the best vase of Sweet Peas in the show, and for the best vases of a 1922 or 1923 variety. The entry which gained the Burpee Cup was easily the finest in the Sweet Pea section. The other leaders worthy of mention in the professional classes included Mr. John Smellie, Helensburgh, and Mr. James Paul, Killearn.

In the Decorative classes, the Invertrossachs Silver Cup for the best decorated dinner table (3 ft. by 4 ft.), presented by Lady Wilson, Callander, was won by Mrs. John Russell, Newton Mearns, with an entry showing exquisite taste and delicacy in arrangement. Mrs. Marshall, Thornton Hall, and Mr. George Reid, Dundee, made very worthy runners-up. Miss Margaret Smilie, Cardonald, had a fine entry for the best bowl of Sweet Peas.

The exhibits in the Rose section made a very fine display, and those securing the premier awards worthily earned their honours. Of all the classes in the show, the unfavourable season seemed to have had the least effect on the Roses. The freshness and fine colours of the exhibits were remarkably good, and the staging was of a high order. The leading honour in this section—the Dickson Cup—was finely won by G. H. Macneal, Esq., Kirn (gr. Mr. D. Murchison). The winning exhibit was comprised of Colleen, Augustus Hartmann, Gorgeous, Pharisäer, Margaret D. Hamill, Marcelle, Edgar Burnett, Mrs. G. Marriott, Mrs. H. Stevens, Madame Melanie Soupert, Faber Konigen, Lieutenant Chaure, Frau Karl Druschki, Mrs. Fred Searle, Golden Emblem, Mrs. G. Norwood, Joseph Hill, Caroline Testout, Mrs. Henry Morse, Clarice Goodacre, Captain Hayward, Mrs. McKellar, Mrs. R. D. McClure, and Madame Jules Bouche.

Mr. James Kerr, Stewarton, led among the amateurs, gaining Messrs. Smith's cup for the third time, and it now becomes his own property. Mr. Kerr's entry was a particularly fine one, his bloom of the Mrs. Henry Bowles being adjudged the best bloom in the gardeners' and amateurs' sections. Messrs. Thomas Smith and Sons, Stranraer, with a reputation of some fifty years behind them, won premier place for twenty-four blooms, distinct varieties, open to Scotland. Irish growers were well to the fore in the competitions open to all. Messrs. A. Dickson and Sons, Belfast, and Messrs. Samuel McGredy and Son, Portadown, had very meritorious displays, the latter being awarded a gold medal (special prize) for a group of new Roses, some of the varieties contained in it winning for the grower the medal of the National Rose Society. Messrs. A. Dickson and Sons had also some outstanding victories to their credit, which included a special prize for the best bloom shown in the nursery classes, the variety being Captain Kilbee Stuart. In the competition for the best twelve Roses, for which Lady Gardiner, Old Ballikinrain, Balfron, gave a valuable Rose bowl, the premier award was won by Mr. William Smith, Dunecht House, Aberdeenshire, with a particularly fine entry. Mr. Murchison, Kirn, and Mr. J. G. Williamson, Giffnock, Glasgow, were also prominent prize-winners.

The display of Border Carnations was not extensive, but for quality it was most commendable. Messrs. Torrance and Hopkins,

Digitized by Google

Rusby, led for twelve vases Carnations or Picotees, with a meritorious entry, and Mr. H. Woolman, Birmingham, made a good second, and also led for six vases, distinct varieties. In the classes open to all, a fine record was put up by Mr. Alex. McMillan, Old Cumnock, Glasgow, quite a young man, who carried off the Irvine Valley Cup for six vases; the medal presented by Mr. James Smith, Darvel, to competitor gaining most points; and the Lowe and Gibson medal for the best single vase of Carnations in the amateur classes. It was a really fine performance, and worthily earned for Mr. McMillan many congratulations.

An outstanding feature in the Carnation section was a fine display of the blooms forwarded by Mr. D. Walker, Kilmarnock. There were over 200 flowers. Mr. James Beats, Binrock, Dundee, secured several premier honours, and Mr. George Reid, Dundee. Mr. William Holmes, Helensburgh, and Mr. Thomas Smart were other prize-winners

It has been stated recently that the nursery trade is dying out in Scotland, and the paucity of trade displays at this show, compared with former years, would lead one to think there is something in the assertion. Messrs. Austin and McAaslin, Cathcart, Glasgow, had a remarkably good display of Roses, and Messrs. Dobbie and Co. had a meritorious exhibit of Roses and Sweet Peas which was greatly admired.

SHEFFIELD.

The Horticultural Show held in conjunction with the Great Yorkshire Agricultural Show held at Sheffield on July 25 and two following days far eclipsed the splendid display held at Hull last year. Liberal prizes were offered, and there was a good response. The exhibits were staged in an admirable manner in two large tents, and the general effect was brilliant. The chief features of the show in the competitive classes were the miscellaneous groups of plants, Roses, Carnations, Sweet Peas and the collections of hardy perennials and cut flowers which were again magnificent. These and the trade displays reached a very high level of excellence.

In the class for a group of miscellaneous plants two outstanding exhibits were staged, and they were the finest we have seen this year. Four groups of hardy perennial plants and cut flowers were arranged down all one side of a tent, and the quality, colour and general effect of these groups were wonderful. Overcrowding was the only fault, but this was nothing like so pronounced as on many previous occasions. The prize-winning Sweet Peas were of fine quality, but, generally speaking, the other groups were not up to the average, the flowers being rather short in the stem, although Roses and Carnations could not have been better.

Trade exhibits were splendid, notably those of Messrs. Sutton and Sons, who had a collection of flowers, fruits and vegetables; Messrs. Alex. Dickson and Sons, Newtownards, who staged a wonderful exhibit of Roses; Messrs. Allwood Bros., Haywards Heath, who showed Carnations; and Messrs. W. Artindale and Son, Sheffield, who had a large and finely-arranged display of plants and cut flowers. Another notable feature in the show was Messrs. Fisher, Son and Sibray's collection of rare stove and green house plants. This firm also arranged other fine exhibits in front of the President's and other offices.

Appended are the chief awards :—

Group of Miscellaneous Plants : 1st, Messrs. Cypher and Sons, Cheltenham; 2nd, Mr. W. A. Holmes, Chesterfield. Collection of cut Carnations : 1st, Mr. C. Engelmann, Saffron Walden. Hardy perennial plants and cut blooms : 1st, Messrs. Harkness and Sons, Bedale; 2nd, W. Artindale and Son, Sheffield; 3rd, Geo. Longstor and Sons, Malton; 4th, G. Gibson and Co., Bedale. Collection of Sweet Peas : 1st, Messrs. Th. Bolton and Son, Halstead; 2nd, Mr. T. Wadsworth, Bishop Wilton, York. Eighteen distinct varieties of Sweet Peas : 1st, Mr. T. Wadsworth; 2nd, Mr. J. Leckentry, Haxby. Collection of Tuberous Begonias : 1st, Messrs. Blackmore and Langdon, Bath. Collection of cut Roses : 1st, Mr. A. J. Allan, Norwich; 2nd, Mr. T. Robinson, Nottingham.

Non-competitive Exhibits.

Large Gold Medal.—Messrs. Sutton and Sons, Messrs. Allwood Bros., Messrs. Alex. Dickson and Sons, and Messrs. W. Artindale and Son.

Gold Medal.—Messrs. Fisher, Son and Sibray, Messrs. J. Backhouse and Son, Messrs. Herd Bros., Penrith, Messrs. J. Forbes and Son, Hawick, Messrs. J. Douglas, Bookham, Messrs. Alex. Dickson and Son (Sweet Peas), Messrs. Little and Ballantyne, Messrs. Brooke, Bray and Co., Sheffield (floral designs).

Silver Medal.—Messrs. Ellinson and Son, Birmingham, and Messrs. Jarman and Co., Stroud.

ROYAL LANCASHIRE SHOW.

August 2-6.—The Horticultural Section of the Royal Lancashire Show was held at Liverpool on August 2, 3, 4, and 6. All the exhibits were staged in one large tent, on an admirable site, and reached a high standard of excellence.

The competitive classes were well filled, and many trade exhibits had to be declined for lack of space. Everything was done for the convenience of the exhibitors and the comfort of the very large number of visitors. Groups of miscellaneous plants, Roses, Carnations, Sweet Peas, and decorated dinner tables were excellent. The display of hardy perennial plants and cut flowers were excellent, and the exhibits were arranged with great taste. Messrs. Bees, Ltd., Liverpool, had an abundance of well-grown blooms, with several novelties, which made their exhibit a distinctive feature.

The following are the chief awards in the competitive classes:—For a group of miscellaneous plants, first, Messrs. J. Cypher and Sons; second, Mr. Holmes. A collection of Orchids, first, Mr. J. Macartney; for six Orchids, first, Messrs. J. Cypher and Sons. Dinner-table decorations, open and trade excluded, first and second in both classes respectively, Mrs. John Nixon and Miss Newsham. Collection of Sweet Peas, on a space measuring 20 ft. by 5 ft., first, Messrs. R. Bolton and Son; second, Mr. F. Bond; for eighteen varieties and twelve varieties of Sweet Peas respectively, trade excluded, W. D. Ingham was first in each class; Mr. T. Wadworth was second for eighteen varieties, and Mr. W. Clayton second for twelve. Mr. A. Bolton was awarded the first prize for twelve varieties of Sweet Peas in the open class, whilst in the other class for twelve varieties Messrs. R. Bolton and Sons were first and Mr. W. D. Ingham second. Mr. C. Engelmann won the first prize of £15 for Carnations. Messrs. A. J. and C. Allen, Norwich, won the first prize for a collection of Roses; second, Mr. Thomas Robinson, Nottingham. Messrs. Bees, Ltd., won the first prize of £30 offered for a collection of hardy perennial plants and cut flowers; second, Messrs. G. Gibson and Co.; third, Messrs. Harkness and Co. Mr. W. Robinson was the chief prize-winner in the vegetable classes. Many admirable collections of vegetables were staged, both in the society's classes and those set apart for trade growers.

Traders' Exhibits.

Trade exhibits were excellent, notably those of Messrs. Sutton and Sons, who had the best exhibit of flowers, fruits, and vegetables in the show and the best we have seen this firm stage this year at any provincial show. They were awarded the only Large Gold Medal, together with a cultural certificate.

Messrs. Dickson and Robinson, Messrs. Allwood Bros., Messrs. Blackmore and Langdon, Messrs. Alex. Dickson (Roses), and Messrs. Herd Bros. were all awarded Gold Medals for splendid exhibits. Silver Medals were awarded to Messrs. Bees, Ltd., Messrs. J. Forbes and Son, Messrs. Alex. Dickson (Sweet Peas), Messrs. Ellison and Son for Ferns, and to Miss Worth for Cacti.

ROYAL HORTICULTURAL.

August 8.—The holiday spirit was abroad on this date, and the few people who visited the Royal Horticultural Hall did not appear to be keenly interested in the exhibits. Only one display of Orchids was forthcoming, and there was none of fruits. Gladioli were plentifully exhibited, and other subjects of note were Phloxes, Roses, Carnations and hardy flowers. Exhibits were comparatively few in number, but of good quality, and there was plenty of room to move about among them.

Orchid Committee.

Present : The Hon. H. D. McLaren (in the chair) and Messrs. J. O'Brien (hon. Secretary), Gurney Wilson (Assistant Secretary), C. J. Lucas, H. T. Pitt, Fred. K. Sander, J. T. Barker, W. H. White and Chas. H. Curtis.

The only exhibit was a selection of hybrids shown by Messrs. Cowan and Co., Southgate, for which a vote of thanks was given. Two specimens of their Brasso-Laelio-Cattleya Muriel (B.-C. Madame Chas. Maron × L.-C. Feronia) bore large flowers of model shape, the colour being light rose-pink with a pale yellow disc; Brasso-Cattleya Rosita (B.-C. Ilene × C. Dowiana aurea) was well shown, and the collection also included the yellow-petalled Cattleya Diana (Sibyl × Dowiana), C. Thebes (Adula × Dowiana) and the finely coloured Laelio-Cattleya J. Ansaldo (Lustre × Hildegarde).

Floral Committee.

Present : Messrs. H. B. May (in the chair), D. B. Crane, W. P. Thomson, W. B. Gingell, C. R. Fielder, J. B. Riding, G. Reuthe, G. W. Leak, H. J. Jones, J. Jennings, W. G. Baker, T. Hay, W. J. Bean, E. A. Bowles, Gerald Loder, H. D. McLaren, H. V. Warrender, C. Elliott, Jas. Hudson, Reginald Cory, H. R. Darlington and C. Williams.

Award of Merit.

Campanula Hallii.—Lovers of dwarf Campanulas suitable for the rock garden cannot fail to be delighted with this dainty little plant, which is the result of crossing C. pusilla alba with C. muralis, the latter being the seed parent. The little specimens shown in small pots were only five weeks old, and propagated from the small stoloniferous growths, which are freely produced, many of these young plants already showing them. The plant, even when in flower, is barely three inches high; the leaves are bright-green, roundish cordate, the uppermost having rather deeply toothed margins; the erect bells, borne freely, are porcelain white. Altogether a charming Campanula. Shown by Mr. A. J. Hall, Harrogate.

Cultural Commendation.

To Mr. W. F. Horne, Woodside, for plants of a white Oleander, beautifully flowered. The specimens were in 48 sized pots.

Other Novelties.

Buddleia nanhoensis with branched inflorescences suggesting a poor B. variabilis was shown by Mr. Clarence Elliott; we are informed that this species is dwarf, rarely rising above 4 ft., and very free flowering, consequently, it may be planted where B. variabilis and B. Veitchii would prove far too robust. Calceolaria Glasgow Beauty, shown by Lord Lambourne, is a shrubby, cool greenhouse plant, carrying heads of orange-yellow, red spotted flowers; the colouring is very fine. Miss Homfray showed spikes of the dainty Anomatheca cruenta.

Groups.

Although it was a small show, there was a sufficiency of interesting groups to make the visit well worth while. In the centre of the hall Mr. H. J. Jones had a large oval group of herbaceous Phloxes he grows and shows so well. These were in shallow baskets arranged on the floor and lightened by graceful plants of Cocos Wedelliana. Of the many varieties of Phlox, the chief were Etna, Evelyn, Le Mahdi, Miss A. Ellis, Madame H. V. Hoboken, Rosine, and Frau Ant Buchner (Gold Medal).

Digitized by Google

A goodly variety of Phlox was included in an attractive collection of herbaceous plants exhibited by Mr. M. Prichard, who also staged some very good Kniphofias, Montbretias, and spikes of the somewhat uncommon white variety of Agapanthus umbellatus (Silver Flora Medal).

General border flowers were also shown by Mr. W. Wells, Junr., who had a fascinating stand of Scabiosa caucasica varieties (Silver Banksian Medal).

A long row of double-flowered Hollyhocks was contributed by Mr. F. G. Wood, and chief among them was the beautiful pink variety, Palling Belle (Bronze Banksian Medal).

Mr. H. Marcham, a fresh exhibitor at the hall, staged a quantity of Scabiosa Azure Fairy, which is a pretty decorative flower of mauve colour (Silver Banksian Medal).

Various herbaceous Phlox, Hollyhocks, Heleniums, Monarda didyma and Viclas were well shown by Messrs. Carter Page and Co. (Silver Flora Medal).

Just inside the entrance Mr. Amos Perry had a large collection of herbaceous flowers. Lythrum dalcana was particularly well flowered. Lilium tigrinum plenum and Yucca filamentosa were shown in quantiay, as also were sprays of white Lavender and the silvery foliage of Artemisia pontica (Silver Banksian Medal)

Besides an interesting collection of Gladiolus and Phlox, with general border flowers, Messrs. J. Cheal and Sons had a fine vase of Galtonia (Hyacinthus) candicans. In another part Messrs. Cheal and Sons set up a large collection of Dahlias which, besides being attractive in themselves, served as a reminder that the annual show of the National Dahlia Society is nearly due. Good, typical flowers of all types were staged in the stall. Pompons and Cactus varieties were very attractive (Silver-Gilt Banksian Medal).

Gladiolus were freely shown, and it was the elegant Primulinus hybrids that predominated. Major Churcher, Lindfield, had several of his excellent seedlings. Nydia, a beautifully hooded flower of deep rosy pink flushing, and Ostranto, of golden shading, with crimson lines on the lower segments, were superb (Silver Flora Medal).

Messrs. R. H. Bath, Ltd., had large vases of such valuable sorts as Hespera, Niobe, Souvenir, Lyser and Arlon (Silver-Gilt Banksian Medal).

Mr. Alfred Edwards filled a corner space with Primulinus hybrids (Silver Flora Medal).

Messrs. Lowe and Gibson showed a number of their seedlings, of which Salmon Beauty Altair and Pansy, of the Primulinus type, and Montezuma, Red Fire and Incontestable were the very best (Silver Flora Medal).

The larger-flowered sorts predominated in the collection arranged by Messrs. Kelway Bros., and these included J. E. W. Tracey, Eteocles, Superb, Orby, Corri, Golden Dawn and Nonpareil (Silver-Gilt Flora Medal).

Roses were better than might have been expected in view of the hot and dry weather. Messrs. Alex. Dickson and Sons staged excellent cases of Betty Uprichard, Lady Inchiquin, Sunstar, Frances Gaunt, Isobel and Richard West. The last named is a new H.T. of medium, rounded shape and pale yellow colour, shaded with apricot in the centre (Silver-Gilt Flora Medal). Such single-flowered sorts as Pax, Mermaid, Isobel and Vanity predominated in the collection of the Rev. J. H. Pemberton (Silver Flora Medal).

Carnations were displayed in quantity by Messrs. Allwood Bros. and Mr. C. Engelmann. The former had splendid vases of Sussex Crimson, Chintz, Wivelsfield Apricot and Wivelsfield Claret, and also arranged a great variety of Dianthus Allwoodii (Silver-Gilt Banksian Medal). Chief amongst Mr. Engelmann's varieties were Coquette, Circe, Topsy, Laddie and Tarzan (Silver Banksian Medal). Mr. J. Klinkert displayed well-trained topiary specimens (Bronze Banksian Medal).

Fruit and Vegetable Committee.

Present: Messrs. J. Cheal (in the chair), Geo. F. Tinley, H. S. Rivers, S. B. Dicks, G. Reynolds, W. G. Lobjoit, W. F. Giles, E. Neal, W. Bates, W. H. Divers, E. A. Bunyard, H. Markham and A. N. Rawes.

No exhibit was forthcoming in the competition for the Bunyard Medals offered for Peaches and Nectarines, and no other exhibit of importance was shown in this section.

Trials at Wisley.

The following awards have been made by the Royal Horticultural Society to the undermentioned subjects after trial at Wisley.

Autumn Sown Lettuce.

First-Class Certificates.

Winter Giant, sent by Messrs. R. Veitch and Son; *Stanstead Park* (large form), sent by Messrs. Nutting and Sons, Ltd.; *Brittany Winter White*, sent by Messrs. Barr and Sons; *White Madeira*, sent by Messrs. Barr and Sons.

Awards of Merit.

Hammersmith Hardy Green, sent by Mr. Cullen and Messrs. Watkins and Simpson, *Hardy Hammersmith*, sent by Messrs. Dobbie and Co.; *All the Year Round*, sent by Mr. Simpson, Messrs. Watkins and Simpson, Messrs. A. Dickson and Sons, Messrs. Toogood and Son, Messrs. Dobbie and Co., and Messrs. Nutting and Sons, Ltd.; *Density Cos*, sent by Messrs. Nutting and Sons, Ltd.; *Winter Density*, sent by Messrs. R. Veitch and Son and Messrs. Watkins and Simpson; *Gem Cos*, sent by Messrs. Harrison and Sons; *Goldring's Bath Cos.*, sent by Messrs. Toogood and Son.

Highly Commended.

Early French Frame, sent by Messrs. Watkins and Simpson; Hercules (syn. Webb's Wonderful), sent by Messrs. Dobbie and Co.; Grand Admiral, sent by Messrs. R. Veitch and Son; Schofield's Hardy Winter, sent by Messrs. Barr and Sons; Winter Brown, sent by Messrs. Barr and Sons; Reliance, sent by Messrs. Barr and Sons and Messrs. Watkins and Simpson.

Commended.

Trocadero, sent by Messrs. Watkins and Simpson, Messrs. Barr and Sons and Messrs. R. Veitch and Son.

Cucumbers.

First-Class Certificates.

Aviator, sent by Messrs. Barr and Sons; *Royal Osborne*, sent by Messrs. Barr and Sons.

Awards of Merit.

Pride of the Market, Covent Garden, Frogmore Prolific and *Lord Roberts*, all sent by Messrs. Barr and Sons.

Highly Commended.

Prolific, sent by Messrs. Dickson, Brown and Tait; Bounteous, sent by Messrs. Dickson and Robinson; Everyday, sent by Messrs. Barr and Sons.

Carrots for Frame Cultivation.

Awards of Merit.

Early Frame, sent by Messrs. Barr and Sons; *Early Parisian Forcing*, sent by Messrs. Barr and Sons; *Amsterdam Forcing*, sent by Messrs. Zwaan and de Wiljes and Mr. van der Veld; *Long Forcing*, sent by Messrs. J. Carter and Co.

Highly Commended

Guerande, sent by Messrs. R. Veitch and Son; Early Horn Improved, sent by Messrs. J. Carter and Co.; Primo, sent by Messrs. Watkins and Simpson and Messrs. Barr and Sons.

Salpiglossis (Under Glass).

Awards of Merit.

Superbissima aurea, sent by Messrs. Barr and Sons; *Yellow*, sent by Mr. A. Dawkins; *Yellow edged White*, sent by Mr. Simpson; *Chamois*, sent by Messrs. Barr and Sons; *Chamois rose carmine centre*, sent by Mr. Simpson; *Velvety Red Gloxinia-flowered*, sent by Mr. Simpson; *superbissima Light Blue*, sent by Mr. A. Dawkins; *Violet d'Iris*, sent by Mr. Simpson; *Purple and Gold*, sent by Messrs. Toogood and Son; *Dwarf Large Flowered Mixed*, sent by Mr. Simpson.

Highly Commended.

Superbissima Yellow, sent by Mr. A. Dawkins; superbissima Chamois, sent by Mr. A. Dawkins; Superbissima Dark Scarlet, sent by Mr. A. Dawkins; Lilac-veined Yellow, sent by Messrs. Barr and Sons; Purple-violet and Yellow, sent by Messrs. Barr and Sons; Purple, sent by Mr. A. Dawkins; Black, sent by Messrs. Barr and Sons.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

Thursday, July 19th.—Committee present: A. Hanmer, Esq. (in the chair), Messrs. R. Ashworth, W. Beesley, B. J. Beckton, J. Birchenall, A. Burns, A. Coningsby, D. A. Cowan, A. T. Cussons, A. G. Ellwood, J. Evans, W. Giles, J. Howes, D. Losh Thorpe, D. McLeod, J. Lupton, D. F. T. Paul, F. K. Sander, E. W. Thompson, J. Whitham, and H. Arthur (secretary).

First-class Certificates.

Odontonia Malby var. Decora (*M. Bleuana* × *Odm. percultum*), a beautiful flower, spotted purple, the large white lip having markings at the base; *Vuylstekeara insignis var. picta*, a distinct variety, the sepals and petals being deep maroon with white edges, and the large white lip shaded light maroon. From P. Smith, Esq.

Cypripedium Godefroyae splendidissimum, a richly coloured variety, the large flower being of excellent shape. From S. Gratrix, Esq.

Odontioda Verulam (*Odta. Madeline* × *Odm. majesticum*), a very fine and richly coloured variety. From Messrs. Sanders.

Awards of Merit.

Odontoglossum Zenith (*parentage unknown*); *Odm. Doreen var. Blue Bird*; and *Cypripedium Godefroyae amabile*. From S. Gratrix, Esq.

Odontoglossum Alcimeda superba (*Jasper* × *Ossulstonii*); *Odontioda Colingc var. Prince of Orange* (*Odta. coronation* × *Odm. c. Lucianii*). From A. Hanmer.

Odontoglossum Schlieperianum citrinum and *Promenaea stapelioides superba*. From P. Smith, Esq.

Odontoglossum Princess Patricia (*Dora* × *crispum*). From Mrs. Gratrix.

Miltonia Bleuana, Rutherford's variety. From Col. Sir J. Rutherford, Bart.

Groups.

S. Gratrix, Esq., West Point (gr., Mr. J. Howes) staged a group to which a Silver-gilt medal was awarded.

Mrs. Bruce and Miss Wrigley, Bury (gr., Mr. A. Burns) were awarded a large Silver medal for a group in variety.

GENERAL BULB GROWERS OF HAARLEM (HOLLAND).

The different floral committees of the above Society made the following awards during the session June 25 to July 15.

First-Class Certificate.

Iris hispanica Leviathan.—A dark golden yellow variety.

Awards of Merit.

Delphinium Johan.—The flower is indigo-blue, with a mauve centre and white eye.

Delphinium Lady Astor.—A soft rosy-mauve, self-coloured variety; the spike is small and compact.

Delphinium Mrs. Willy van Egmond.—The semi-double flowers are turquoise-blue, shaded pink; the eye is white.

Iris hispanica Bianca.—This is a nearly white variety, with a violet shade and a small yellow blotch.

Iris hispanica Blue Giant.—The standards of this variety are purple, the falls lavender-blue, small and round, with a yellow blotch.

Digitized by Google

Papaver orientale Wilhelmina Regina.—A very large flower of salmon-pink colour.

Ranunculus asiaticus superbissimus Mahony (French Ranunculus).—This variety has large, dark brownish-red flowers on long stems.

NEW HORTICULTURAL INVENTIONS.

Latest Patent Applications.

18,197.—Hanff, E. Spades, scoops, etc. July 14th.

18,116.—Starr, F. E. Lawn-mowing machines. July 12th.

18,050.—Worship, V. T. Garden barrows. June 12th.

17,207.—Aitkens, G. Hoes. July 3rd.

17,117.—Crandall, L. W. Handles for digging implements, etc. July 2nd.

17,610.—Hunter, C. M. Means for holding seeds, plants, etc., for forcing etc. July 6th.

Abstract Published last Month.

New Plant Label.—Mr. C. E. West, of 11, Norfolk Road, Higham Hill, London, has recently obtained a Patent No. 198,081 for a plant label made of celluloid formed with a pair of U-shaped slots through which a stem or support is threaded, the material within the U being depressed to assist in gripping the stem, which is preferably corrugated. Both slots are turned in the same direction and the material depressed on opposite sides of the label. In a modification, the slots are turned in opposite directions and the material depressed on the same side. The stem is bent round a branch or otherwise secured. Further modification shows two pairs of slots formed in the label and the stem formed of a bent strip, one end passing through each pair of slots.

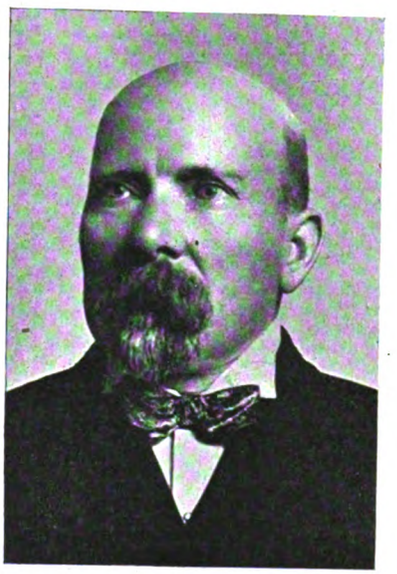
Messrs. Rayner and Co. will obtain printed copies of the published specifications and abstract only, and forward on post free for the price of 1s. 6d. each.

This list is specially compiled for the *Gardeners' Chronicle* by Messrs. Rayner and Co., Registered Patent Agents, of 5, Chancery Lane, London, from whom all information relating to Patents, Trade Marks and Designs can be obtained gratuitously.

Obituary.

George Caselton.—The many friends of Mr. George Caselton, who for a number of years was in charge of the gardens and pleasure grounds attached to the Crystal Palace, Sydenham, will regret to learn of his death, which occurred on Tuesday, the 31st ult. Mr. Caselton succeeded the late Mr. G. Head as Superintendent of the Crystal Palace Gardens, and it was unfortunate that during the latter part of his office the gardens were allowed to lapse from their former high state of efficiency, although through no fault of Mr. Caselton, as the income of that large establishment was insufficient for its proper upkeep. What he did, however, showed him to be a capable craftsman, and he took the greatest interest in the numerous horticultural exhibitions which at that time were held at Sydenham, being ever ready to lend his valuable aid in making these events successful. His genial and pleasing manner won for him a host of friends in the horticultural world, and although in later years he had lived in retirement, the news of his death will be learned with sorrow by horticulturists in all parts of the country. The esteem in which Mr. Caselton was held was evinced in the raising for him of a sum of money to assist him during his long period of ill-health and incapacitation. He was a member of the Executive Committee of the National Chrysanthemum Society and for a long number of years Mr. Caselton served as a member of the Committee of the Royal Gardeners' Orphan Fund, and in connection with the discharge of his duties on the Management Committee of that Fund, as well as in any other movement with which he was associated, he always displayed great zeal and sound judgment, and his loss will be deeply mourned.

S. Mortimer.—It is with very great regret we record the death of Mr. S. Mortimer, of Swiss Nursery, Farnham, Surrey. Mr. Mortimer, who died on the 22nd ult., had attained a ripe old age, but the news of his death came as a surprise to his many friends, for



THE LATE MR. S. MORTIMER.

only recently he was in fairly good health, although he was missed at the R.H.S. meetings, which he had in former years attended so frequently, generally with exhibits of Cucumbers, Tomatos and other vegetables, of which he raised numerous outstanding varieties. Some fifteen or twenty years ago Mr. Mortimer showed extensively, and especially Dahlias, the chief prizes for show Dahlias being generally won by him at the exhibitions of the National Dahlia Society. This clever raiser also introduced several fine Melons and Carnations, and he had a particularly fine strain of winter-flowering Stocks. Several of his novelties received awards from the R.H.S. Fruit and Vegetable Committee, of which he was at one time a member, and those who remember his exhibits will recollect that the produce he staged was always of the highest quality, pointing to his ability as a first-class cultivator. One of his greatest successes was the raising of Tomato Winter Beauty, which was a favourite with cultivators for many years.

ANSWERS TO CORRESPONDENTS.

Cleaning Marble and Stone Statues: *U.* Caustic soda will destroy vegetable matter on stone, wood or marble. A week solution would probably suffice on smooth marble, but if a strong one is used the operation should be performed quickly and the solution washed off afterwards. Rub the statue well with a stiff hand-brush, and when the green matter is thoroughly loosened wash or sponge the statue with warm, soapy water. Stone statuary could be treated with quite a strong solution of caustic soda and well scrubbed with a hard or stiff brush after the stone has been thoroughly wetted for some time. It would be advisable to wear a pair of old leather gloves while doing this work, to save the hands, for caustic soda very quickly corrodes the skin and causes grievous sores. In some cases marble may be cleaned with strong, warm, soapy water. Much depends upon how long the marble statues have been allowed to stand without cleaning; cleaning should be done at least once a year, or twice if the statues are continually exposed. Most acids will attack marble and spoil the polish, so it would be best not to use them.

Clover in Tennis Court: *N. A. P.* Nitrogenous fertilisers will encourage the growth of grass and discourage that of Clover, but you should endeavour to remove as many of the Clover roots as possible by means of a spud.

Correction.—Messrs. H. Beckett and Barnes' address (see p. 48) should be Upton St. Leonards, Glos.

Epimedium Leaves Perforated: *J. S.* The cutting of Epimedium leaves represents the work of a leaf-cutting bee. These insects form nests in any suitable hole, and line the hole with a casing of cut leaves. The method of the bee is first to limit the length of the hole to its requirements by a plug of cut foliage. It then cuts further pieces of foliage of an oval shape, with which it forms a hollow tube lining the original tube. Finally, it cuts a circular piece of leaf, which it uses as a cap to seal the tube. Its eggs are laid inside, together with suitable food for the future larvae.

Names of Plants: *O.* Sedum acre. *W. T. W.* 1, Rosa elegantula; 2, R. spinosisima var.; 3, Corydalis lutea; 4, Sedum acre; 5, Buxus sempervirens; 6, Mimulus (Diplacus) glutinosus; 7, Helxine Solierolii; 8 and 9, Ferns too scrappy and undeveloped to identify. *G. H.* We cannot undertake to name florists' flowers.—*S. C. B.* A varietal or hybrid form of Orchid maculata. *A. W.* A Stapelia. Species not recognised; send when in flower.—*A. H. B.* Ceanothus dentatus.—*Middleton.* Crinum pedunculatum.—*L. S. A.* 1, Erysimum orientale; 2, Epilobium angustifolium.—*C. T.* Rhododendron Wilsonii.—*J. R. K.* 1, Acer pictum; 2 Quercus Turneri: 3, Syringa Emodi; 4, Quercus acuta; 5 and 8, Thuya plicata; 6, Cupressus Lawsoniana var.; 7, C. nootkatensis; 9, Cephalotaxus drupacea.

Nectarine Fruits Splitting: *Anxious.* The cause of the splitting of the Nectarine fruits may probably be found in the failure of the wood to ripen last autumn. It may possibly also be due in some measure to lack of moisture in the soil about the roots last autumn and, judging from the undeveloped kernels, we believe your soil is lacking in lime.

Peach Early Rivers with Split Stones: *J. E. R.* Peach Early Rivers is one of the worst varieties we know to crack at the stone, and although a large and good Peach, it has been discarded in many gardens, as the stones split badly, even in dry seasons. To obviate this trouble so far as possible, fertilise the flowers with pollen from other varieties of early Peaches or Nectarines.

Peach Leaves Perforated: *S. H.* The circular perforations in the Peach leaves are ample evidence of an attack of the shot-hole fungus, Cercospora circumscissa. We refer you to our answer to *W. A. C.*, on p. 14, June 7, 1923.

Phloxes Failing: *J. R. and Correspondent.* Your Phloxes appear to be suffering from an attack of eelworm. Plant fresh and perfectly healthy stock on a new piece of ground. Burn all diseased plants and dis-

Digitized by Google

infect the soil on the old site with Naphthalene or similar disinfectant.

Phloxes and Violas Failing: *E. B.* The Phlox plants appear to be affected with eelworm, and this pest may also be responsible for the failure with Violas.

Pine Weevil: *B. S. B.* The only means of dealing with forest land where young trees are being injured by Pine Weevil is to lay trap logs at frequent intervals, which must be examined at least once a day, and the weevils collected. Sections of young stems or branches of Scots Pine, 1½ to 2 feet long, and 2 to 3 inches thick, with the bark intact, are very suitable for use as traps. The larval stage is passed in old stumps and roots, and little can be done to clear the pests from land that is filled with infested stumps. It is, however, possible to do a great deal by trapping mature insects, as stated above, for they feed on young plants, and readily take to trap logs. A bulletin on the subject may be obtained for a few pence from the Secretary, Forestry Commission, 22, Grosvenor Gardens, London, S.W.1.

Plumbago Unhealthy: *P. L. A.* The plant is infested with green fly and attacked by mildew. The aphis may be destroyed by a nicotine insecticide, but mildew is rather more difficult to deal with. You might try dusting the plant with black sulphur, which is not so unsightly to use as the yellow flowers of sulphur.

Prevention of Dry Rot of Timber: *W. P.* and *B.* The walls that are infested with dry rot fungus should be scraped, and then thoroughly washed with a 25 per cent. solution of carbolic acid or corrosive sublimate, the washing being repeated as soon as the walls are dry after the first washing. Means should also be taken for the permanent admission of air to the walls that appear to be permanently damp. If the walls are without a damp course, they should be underpinned, and a damp course added.

Strawberry Runners from Barren Plants: *F. K.* You will be running considerable risk if you propagate Strawberries from plants which have not flowered, as plants which are barren one season usually continue to remain so.

Sweet Pea Legends: *M. C.* So far as we are aware, there are no legends attaching to the Sweet Pea, as in the case of the Rose, Forget-me-Not and other popular flowers.

Sweet Peas Unhealthy: *G. P. and Son.* The unhealthy condition of your Sweet Peas is due to cold weather following high cultivation. As the weather has improved the plants will probably grow out of the trouble.

Tomatos Failing to Set: *W. G. R.* The appearance of the specimen suggests that too free use has been made of some nitrogenous fertiliser, with the consequence that the plants have been more inclined to make growth rather than fruit. At the same time the atmosphere of the house has evidently been much too moist, with the result that fertilisation has been very imperfect. Use less forcing manures and firmer soil, and provide a buoyant atmosphere.

Vine Leaves Discoloured: *D. S.* The discoloration of the foliage is no doubt due to the scorching action of the sun. There was no fungus present in the foliage.

Woodlice: *E. B.* Provided no plants are likely to be damaged thereby, you may exterminate woodlice by pouring boiling water into their haunts. A good trap for woodlice consists of two pieces of dirty board placed one on the other, the dirt providing just sufficient room to enable the woodlice to crawl in between. Such traps should be examined frequently and the pests destroyed.

MARKETS.

COVENT GARDEN, Tuesday, August 7, 1923.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.

Remarks.—The demand generally has been fairly good during the holiday week, the fine weather no doubt stimulating the consumption of fruit. Moderate supplies of English Apples have been marketed, and a firm inquiry rules for sizeable samples of Beauty of Bath and Gladstone, as well as for large cooking varieties. A large proportion of the Apples, however, are on the small side. A few Sturmer Pippins are still on offer, but stocks are low. English Plums are in better supply, but the low values of French and Spanish arrivals adversely affect prices. Choice fruits, such as Grapes, Peaches, Nectarines, Figs and Melons, are in moderate request, and prices are lower. A few late Cherries are still arriving and selling at comparatively high figures. Mushrooms are more plentiful, with outdoor supplies available. Except for a few good Peas, vegetables are not in very great demand. New Potatos meet a steady demand.

Remarks.—Business was more brisk in this department during the latter part of last week. At the time of closing on Saturday morning last only very little of the commoner flowers were unsold, all the best subjects being cleared very early. With the exception of Lilium longiflorum there appeared to be no shortage of any particular flower, and better quality blooms of this Lily advanced in price, reaching towards the week-end 8s. and 9s. per bunch. There is a lower demand for this Lily this morning, and prices are again on the down grade. Large-flowered Gladioli from home growers begin to show signs of finishing. Small consignments of blooms are arriving from Holland, including a few of The Bride variety. Chrysanthemums are beginning to make their appearance, there being small consignments of disbudded blooms of Sanctity, which are fairly good. A few spray bunches of bronze varieties are also offered, but at present these are very medium in quality. There are no other new flowers to record, and steady conditions are likely to prevail for the next few days. The general supplies of Carnations are somewhat affected by the hot weather. Roses are in a trifle better condition, and supplies have not been so heavy during the past week.

GARDENING APPOINTMENTS.

Mr. Albert. T. Smith, late of Messrs. Clibrans, Altrincham, and Messrs. J. Piper & Sons, London and Langley, Landscape Departments, as Gardener to J. Gemmell, Esq., Harescombe, Northwood, Middlesex.

Mr. N. A. Primrose, for the past five years Gardener to the late Mr. W. E. Green and Captain St. John Headley at Devonshire House, Strawberry Vale, Twickenham, as Gardener to Spencer Brett, Esq., The Hollies, Boxmoor, Hertfordshire.

Mr. E. G. Langford, for the past three years Gardener to Mrs. Mabee Wood, Walmer Place, Deal, as Gardener to R. P. Doxford, Esq., Silverlands, Boarshead, Sussex.

Mr W. C. Foote, for the past four-and-a-half years Gardener to E. A. Chettle, Esq., Brockenber Lodge, Sunningdale, Berkshire, as Gardener to the same gentleman at Alderbrook Park, Cranleigh, Surrey.

Mr. J. Shelton, for nearly twenty years Gardener at the Wildernesse Gardens, Sevenoaks, Kent, has recently taken charge of the gardens at Wakefield Lodge, Stony Stratford, Buckinghamshire, under the same employer, Lord Hillingdon. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eds).

Mr. H. W. Stenning, previously Gardener at Gunton Park, Kew, and Compton Place, as Gardener to the Rt. Hon. Viscount Ebrington, at Ebrington Hall, Campden, Gloucestershire.

Mr. S. A. Cheffins, for over nine years Gardener to Col Stapylton, Myton Hall, Helperby, Yorkshire, and previously ten years with the late Rt. Hon. G. Noel, Catmose, Oakham, Rutland, as Gardener to B. Dawson, Esq., Nun Appleton Hall, Bolton Percy, Yorkshire. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eds.)

SCHEDULES RECEIVED.

British Carnation Society.—Twenty-eighth exhibition, to be held in the Winter Gardens, Harrogate, on August 22, 23 and 24.—Secretary, Mr. P. F. Bunyard, 57, Kidderminster Road, Croydon, S.E.

Leagrave, Limbury and District Horticultural Society.—Twenty-fourth exhibition, to be held at The Park, Leagrave, on August 6.—Secretary, Mr. F. Hudson, High Street, Leagrave.

Flower Shows. It is a matter of regret that the flower show, once the most popular function of the village year, is a fête whose observance for the time being is becoming more honoured in the breach than the observance. Whilst the large shows of Chelsea and York and Shrewsbury flourish, the local flower show is becoming rare. For the intermission it is not easy to account. There never was a time when interest in and knowledge of horticulture was more widely diffused than it is at present. Young people—albeit not the very young—are apt, no doubt, to be impatient when flowers and gardens are made the subject of conversation and to be still more so when visitors prefer to inspect the gardens rather than the tennis courts. But it is probable that this was always so, for youth demands very active pleasures and those of contemplation are premature. Among the old, however, the regret at the omission of the flower show is very real. They have a soft place in their hearts for flowers and the connoisseur's eye for successful cultivation, and they miss the annual review of achievement which used to serve to encourage them in their own efforts and to console them for their failures. Among the many means of improving horticulture, it is probable that the flower show stands first. It provides the young gardener with a standard of comparison and teaches all of us who pride ourselves on our skill as cultivators a measure of modesty which is most becoming. When the show is held in the big place of the countryside, the visitors have, or should have, many object lessons in the successful and thrifty management of the garden. They may see, for instance, how to train fruit trees—a form of art which, alas, is becoming rare, and having seen good examples they may discover that even the small garden may supply—if good varieties are grown well—plenty of fruit to the household. In the ideal flower show there should, of course, be competitions. If held at the right time of the year nothing would be more instructive than a budding competition. Stocks of fruit trees are now fairly cheap and plentiful and from our own observation in small gardens, budding is an art which, like scything and pruning, tends to disappear. Other countries are becoming very much alive to the value of disseminating horticultural knowledge in rural districts. The horticultural societies of Ontario have a membership of over 40,000 and are active in encouraging the formation of local societies. Similar work has, of course, been done in this country by the Royal Horticultural Society, to which not a few local horticultural societies are affiliated; but we think that in view of the importance of the flower show as a means of fostering horticulture the R.H.S. might devote special attention to means whereby this typically English institution might be restored to its once flourishing condition. In many districts at all events it only requires a little initiative to revive the annual show. There would doubtless have to be some additional attractions; but why not? The entertainment tax is a serious hindrance to the revival. People recognise the injustice of a tax on their disinterested enterprise. If there is no band and no side show the tax is remitted; but if, as we hold, it is desirable to re-establish flower shows, encouragement and not discouragement must be given. It should be easy to devise a formula whereby *bona fide* flower shows, even though they need side-shows to attract the countryside, may be absolved from paying the tax.

Imperial Fruit Show, 1923.—We understand that the prospects for the Imperial Fruit Show at Manchester this year point to the exhibition being the most successful of the series. Firms connected with every branch of fruit growing and distribution will be represented by exhibits, and the collective displays should prove very valuable object lessons in methods of production and distribution. The Ministry of Agriculture is arranging to give a special demonstration in Apple grading and packing in boxes, using the Cutler machine. In connection with this demonstration a packing competition will be held to test the skill of expert packers from all parts of the country. The total value of the prizes and guarantee fund is approximately £4,550, and the Committee hopes to raise the amount to £5,000 within the next few weeks. Amongst the recent donations to the prize fund are three silver challenge cups of the value of fifteen guineas each from Messrs. J. and H. Goodwin, Ltd.; a self-recording barometer from Messrs. Muirhead and Maxwell; special prizes to the value of £100 from the Associated Newspapers, Ltd.; and cash prizes of £14, £25 and £10 from Messrs. W. J. Craven and Co., Messrs. Simons and Co., Glasgow, and Messrs. Glover, Hill and Co. respectively.

Roses and Carnations at Harrogate.—We learn from Mr. P. F Bunyard, Hon. Secretary of the British Carnation Society, that the space available for the combined exhibition of the North of England and British Carnation Societies at Harrogate on August 22, 23 and 24, is fully booked up, and the Winter Gardens and adjacent ground will be filled completely with exhibits. Conferences will be held daily. Mr. E. F. Hawes will speak on "The Decorative Value of the Carnation in the Garden. the Greenhouse, and the Home." Mr. C. H. Taudevin will open a discussion on "The Cultivation of the Carnation," and Rev. J. H. Pemberton will give an address on "New Roses."

Fruit and Vegetable Crops in the Netherlands.—Returns furnished to the Ministry of Agriculture from official Dutch sources show that many of the fruit and vegetable crops in Holland are much below the average. As with us, Pears are a very poor crop, but Apples are fairly good, and Plums even better. Taking sixty-seven as an average crop in each instance, the yields of Apples, 49, Pears, 30, and Plums, 52, are all below the normal. Grapes under glass are slightly above the average. Autumn-sown and transplanted Onions, 62, spring-sown Onions, 56, Tomatos, 52, and main crop Potatos, 55, are all slightly below normal yields. The amount of land devoted to main crop Potatos in Holland is estimated at 329,653 acres as against 412,172 acres last year.

Government Subsidy for Commercial Lorries.—The War Office has offered a subsidy of £40 a year to all purchasers of approved vehicles or chassis of British manufacture who enrol under the scheme which entitles the War Department to purchase such vehicles in a national emergency at a price fixed by agreement at the date of enrolment, which will extend up to two years, and in exceptional cases to three years. The lorries must be of 30 cwt. and fitted with giant pneumatic tyres. Full particulars may be obtained of the Secretary of the War Office, Imperial House, Tothill Street, London, S.W.1.

Canada of To-day.—In bygone years, numbers of Irish labourers used to come to England to assist in harvest operations; to-day British labour goes to Canada to assist in the ingathering of an abundant Wheat crop. This is a reminder of the vast wealth, patent and potential, which the great Dominion holds and which is being steadily developed. In *Canada To-day*,* prospective emigrants will find a standard reference book of general information about Canada, and a perusal of this book cannot fail to prove interesting to all concerned with agriculture, forestry, and allied businesses. To educationalists and to sportsmen this useful publication makes a strong appeal, while to the student of finance the information on taxation, banking, real estate, and the export and import trade of Canada is of special importance. All the important phases of Canadian life and work are dealt with in an interesting fashion, and over two hundred illustrations serve to elucidate the text and excite the envy of those who love grand scenery and the wide, open spaces of the world.

U.S.A. and the Plant Quarantine Order.—The way in which the American Quarantine restrictions adversely affect European horticultural traders has been set forth in these columns on various occasions. Hitherto the restricting order has been imposed ostensibly for the purpose of excluding from the United States such pests as might be imported with the plants, but many European traders have considered the action of the American Federal Horticultural Board as prohibitive rather than protective, and they will find further ground for that belief in a statement made at the annual convention of the American Association of Nurserymen, on behalf of Dr. C. L. Marlatt, Chairman of the Board. It appears that Dr. Marlatt was not present at the convention to give his anticipated address on the "Solution of Nurserymen's Problems," but Mr. Chase read Dr. Marlatt's report regarding Rose stocks, and we quote from the *Florists' Exchange*, of July 7: "You can now," said Mr. Chase, "import the Manetti and other Rose stocks, but the Federal Horticultural Board has in mind placing a quarantine on these and everything they consider that this country can produce. The question is, whether

* *Canada To-day.* Published annually by the Canada Newspaper Co., Ltd., 110, St Martin's Lane, W.C.2.

Digitized by Google

or not in the opinion of nurserymen the time has arrived to consider putting Rose stocks on the excluded list. The F.H.B. has been advised by Rose growers and others, practically from all sections of the country, that it is possible for home production to meet all the Rose stock needs, but it would like to have the A.A.N. Committee make inquiry through the nursery and florist channels and advise of the conclusion reached. Mr. Chase thought the larger Rose growers would be able to make some statement as to whether or not we could produce in America all the Roses needed, and Mr. Perkins said he was on the Advisory Committee, and at the time this letter came in from Dr. Marlatt, it made up a list which was representative of the Rose growing industry throughout the country. Out of the forty-eight names in the list, twenty-five advised shutting out further importations. The difficulty experienced by the Advisory Committee in handling a proposition of this kind is that which the Legislative Committee has always been up against, namely, divided opinion among the membership as to what is best. He asked that some definite decision be reached at this meeting, as Dr. Marlatt would like the views of the association. It will necessarily take some time for the country to get in shape, and for nurserymen to supply themselves with necessary requirements to start production of this kind, but California and practically all of the Pacific Coast States have been successful in growing Manetti stocks, and that seems to be the only one stock about which there is any contention. Some florists have stated that the California, Washington and Oregon Manetti is not suitable for their purposes, that they have not been able to get them grown in sizes suitable for their purposes; personally he thinks that with a little experience and time this stock could be produced just as good as, if not better than, anything that comes in from the other side. Dr. Marlatt had discussed this and also other matters pertaining to further exclusions, and said the Board's policy was going to be to give the trade two or three years' notice before anything was done. He believes that if the trade were given that much time in which to get ready to propagate Rose stocks, there would be a good supply, ample to take care of the demand at the expiration of the time of importation."

Trial of Pinks and Allied Plants at Wisley.—The Royal Horticultural Society will carry out a trial of varieties of Pinks and allied plants for cultivation outdoors in their gardens at Wisley during the coming year. Three plants of each should be sent in time to reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey, on or before September 30.

Forst Rose Show.—The Rose show held at Forst, Lausitz (Germany), last month (see *Gard. Chron.*, June 23, p. 354) was only partially successful, in that the enormous rates charged by the railways for freight prevented many growers who would otherwise have competed from doing so. Apart, therefore, from the Roses already permanently on view, to the number of some 30,000, in the Wehrinsel Park, where the show was held, there were very few exhibits. Nothing, however, could have exceeded the enthusiasm shown by the population of Forst and the neighbouring towns, who came in their thousands to see and admire. The organisation was excellent, the weather perfect, everyone in high good humour—and as those exhibitors who did make a sacrifice to bring a display, showed Roses of the highest quality, perhaps the absence of quantity was not of very great importance.

Condition of the Crops.—The Monthly Report published by the Ministry of Agriculture shows that the total area under crops and grass is 25,941,000 acres, comprising 11,182,000 acres of arable land and 14,759,000 acres of permanent grass, showing a reduction of 85,000 acres on last year's figures. The total area of Potatos, 467,000 acres, is 94,000 acres less than in 1922. There has been a reduction of Potato planting in all parts of the country, consequent on the poor financial results of last year's prolific crop, but this year's area is still larger than in any year before the war. The area returned as under Turnips and Swedes is 861,000 acres, this being 40,000 acres more than in 1922. The area of Mangolds, however, 403,000 acres, shows a decline of 20,000 acres, but with the exception of 1922 is the largest since 1915. The area of Beans at 234,000 acres and of Peas at 141,000 acres show substantial reductions of 50,000 acres and 32,000 acres respectively on last year's figures. The area of Beans is the smallest during the last twenty years, excepting that of 1917, while apart from the war period the area of Peas is also the lowest on record.

Mr. W. G. Irving.—The position of superintendent of Covent Garden Market is a very important one in the horticultural world, and one that has been occupied in past years by men who became widely known for their organising ability and wide knowledge of the vast trade in fruits, flowers and vegetables carried on each day in this great London market. Mr. Assbee served as superintendent for about a score of years, and was succeeded by Mr. Frost, who retired recently after occupying the position

MR. WILLIAM G. IRVING.

for fifteen years, and he is now succeeded by Mr. William G. Irving. Mr. Irving is a Lancashire man, and after his school days at Aintree, he entered the mercantile marine, in which he served for three years. Later he acquired a knowledge of building and estate management and in July, 1918, he came from Liverpool to London to manage the Covent Garden estate, then just taken over from the Duke of Bedford. He was at the same time appointed Assistant Secretary of the newly formed Covent Garden Estate Company, and this position he will still retain. During the past five years Mr. Irving has gained intimate and personal knowledge of market methods, market business, and market men, and this knowledge places him in an especially favourable position to carry out his new duties as Market Superintendent. He has abundant energy, and is easily approachable on all matters concerning the market, therefore there is every promise that he will quickly gain the respect and regard of all who do business in Covent Garden, and that complete success will attend him in his new office.

New Dahlias.—The Joint Committee composed of selected members of the Royal Horticultural Society's Floral Committee and the National Dahlia Society, will hold its first meeting this season at the Royal Horticultural Hall, at 11 a.m., on Tuesday, August 21, for the purpose of considering the merits of any new Dahlias submitted, and choosing those worthy of trial in the R.H.S. Gardens at Wisley. Mr. H. B. May will, as usual, be Chairman of the Committee, and the R.H.S. nominees are Mr. R. Cory, Mr. D. B. Crane, Mr. H. J. Jones, Mr. J. B. Riding, and Mr. A. Turner, while the National Dahlia Society has nominated Mr. J. Cheal, Mr. J. Emberson, Mr. A. E. Vasey, Mr. J. T. West and Mr. A. C. Bartlett.

British-Grown Carnations at a South African Flower Show.—Amongst the exhibits of the Durban and Coast Horticultural Society's show held in July last were some excellent Carnation blooms exhibited by Messrs. Allwood Bros., of Wivelsfield Nurseries, Haywards Heath, and Mr. C. Engelmann, Saffron Walden. Messrs. Allwood Bros. exhibited fifty and Mr. Engelmann forty varieties. The flowers were frozen in blocks of ice and transported in a cold chamber on one of the boats of the Union Castle Company. According to the *Natal Mercury*, the flowers arrived in excellent condition, and while the Natal blooms were said to be equal and even better in point of size, they could not compare with the British grown flowers in colour. Natal is apparently suited to the cultivation of Carnations, for no fewer than 2,600 blooms were staged.

Legacy to a Gardener.—The late Mr. Robert Whitworth, of Halifax, Yorkshire, who died on April 27 last, bequeathed the sum of £100 to his gardener, Mr. James Clifton, if still in his service.

Appointments for the Ensuing Week.—Tuesday, August 21: Royal Horticultural Society's Committees meet. Wednesday, August 22: Christleton Fruit and Flower Society's show; British Carnation Society's show in conjunction with the North of England Horticultural Society's show at Harrogate (three days); Biggar flower show. Thursday, August 23: Royal Horticultural Society of Aberdeen show (three days); Manchester and North of England Orchid Society's meeting; Dunoon flower show; Peebles flower show; Kilcreggan, Cove, and Roseneath flower show. Friday, August 24: Dunfermline Horticultural Society's show (two days); Blairgowrie flower show (two days); Forfar flower show (two days); Inverness flower show. Saturday, August 25: Hawick Horticultural Society's show; Craigbank flower show; Langholm Horticultural Society's show; Kirkcudbright flower show; Bo'ness and Carriden flower show; Bridge-of-Weir flower show; Dumbarton flower show; Inverkip and Wemyss Bay flower show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Dahlias.* We are now rapidly advancing in the Dahlia season, and the amateurs' attention must be specially directed to this splendid autumnal flower. As seedlings advance for blooming, it will be advisable to disbud, so as to get the blossoms as fine as possible for exhibition, recollecting that the weakest plants usually produce the best flowers. Many contrivances are in use for protection against sun, wind, rain and vermin, which all at certain periods act detrimentally. After all the endeavours to entrap earwigs in the immediate locality of the plants, still, as these pestiferous insects "fly," their visits can never be effectually guarded against, unless the blooms are bagged. We use those made of very fine point net lace; this allows the flower all the air possible, and at the same time effectually excludes the insect before alluded to. Haythorn's hexagon netting will be found a good thing for the purpose, though perhaps it should be of his smallest mesh. It must cover the flower, and be fastened round the stalk, the bloom must then be protected by a cap with a spring at the back, which adjusts it at any given height, as figured in the *Chronicle* of 1847. The continued rain has precluded the necessity of watering, but it will be advisable to mulch the surface of the soil with very rotten manure, and to pay strict attention to the lateral shoots of the plants being properly secured. *Gard. Chron.*, August 12, 1848.

NOTICES OF BOOKS.

Australian Forest Botany.

It is strange that no suitable text-book on forest botany for the use of students and foresters in this country has yet been published. The present work* by Mr. C. T. White, Government botanist of Queensland, admirably supplies the want for Australia; and a similar book adapted to British conditions is urgently needed.

Vol. I. of Mr. White's text-book, which is now before me, deals with morphology, anatomy, and physiology; while a second volume is promised, in which the systematic botany of Australian woody plants and the ecology of the forests of the island continent will be fully treated. In this volume, 105 illustrations are given, the examples being chosen from native trees and shrubs. The technical terms used by botanists are clearly explained.

The part on morphology comprises seven chapters, in which root, stem, leaf, inflorescence, flower, fruit, accessory organs (such as indumentum, glands, foveolae, domatia, prickles, thorns, etc.), and difference in habit are described. Interesting information is incidentally given; thus, in the chapter on seed, the various kinds of germination are discriminated, the examples selected being Palm, Araucaria Cunninghamii and A. Bidwillii (illustrating two different modes in the same genus), Eucalyptus and Peach. It is noted concerning the Eucalypti, which produce seeds abundantly, that two distinct kinds are invariably found in the same capsule, some smaller, brighter, and usually more numerous than the others. These are abortive or imperfect, while the other sort, the heavier and darker seeds, are fertile; but no explanation of this phenomenon is offered. The remarkable stages in the development of Leopard Wood, Flindersia maculosa, are depicted in three illustrations. This tree commences as a shrubby mass of tangled, thorny branches, but, when 4 or 5 feet high, a shoot is produced, which grows up into a small tree, with a smooth stem, all the lower spiny branches having been gradually shed, the crown above bearing only unarmed, leafy branches.

The part on anatomy follows customary lines; but special attention is paid to the structure of the stem and leaf, annual rings, medullary rays, heart-wood, knots, formation of bark, and healing of wounds. The physiology part is an elementary account of the nutritive and reproductive functions of trees. A full index concludes this useful text-book. *A. Henry.*

The Physiology of the Ascent of Sap.

One of the many puzzles most of us must be content to leave alone is the method of the ascent of sap in tall trees—to say nothing of the smaller plants. Theories innumerable have been put forward from time to time, but none of them satisfy everyone. The latest book on the subject is by Sir Jagadis Bose,† who attacks the subject on the lines he has specially made his own. The book is illustrated with a wealth of detailed diagrams, and will afford most interesting reading to all who *think* as they work among plants. Some of the author's conclusions are:—(1) That the xylem (wood-vessel system) is not essential for conduction; (2) that neither transpiration nor root-pressure is essential; and (3) that there are channels other than the xylem for the ascent of sap. Experiments with poisons and anaesthetics prove to the author that "it is the pulsatory activity of living cells which maintains the ascent of sap in the plant." Later on the conclusion is reached that "the pulsatory activity of the cortex propels the sap." It is likely that the book will be criticised as well as appreciated, but the latter is the more graceful act towards so painstaking and interesting a work. *W. C. S.*

HARDY FLOWER BORDER.

VIOLAS.

When liberally treated, Violas occupy a foremost place among bedding plants. Being of easy culture and hardy, they need less attention than many other subjects. To increase the stock of plants, instead of taking off rootless pieces and striking them in frames, I much prefer to take cuttings later on, when they have quite a ring of tiny roots at the base, and plant them either in frames or on a well-prepared border surfaced with sand. Kept well watered in dry weather, such portions quickly form plenty of young roots and grow into useful plants for putting out in April.

Violas require good soil, containing a fair proportion of thoroughly decayed manure; they also need ample moisture at the roots during warm, dry weather. Those who have not tried the method of allowing the plants to remain and flower for a second year should do so. I have a variety named Sweetness, brought here from Scotland, that makes a splendid show in the second year, and is far more beautiful than in the first season. To encourage the production of plenty of young shoots for propagation, some of the old plants should be cut over and top-dressed with light soil, into which the young roots at the base will quickly penetrate. *H. Markham.*

ERIGERONS.

The taller Erigerons, including the forms of E. speciosum, are splendid plants for the hardy herbaceous border, as they continue in bloom through the whole of the summer and often into November. One of the best of the named varieties is Quakeress; it is most effective for planting in beds or borders and good for supplying cut blooms. The plant has a vigorous constitution and a good habit, whilst the delicate, pale, lavender-blue flowers are produced with freedom from July to September.

Erigeron Violet Bedder has a very dense, bushy habit and flowers resembling those of the Amellus type of Aster; the blooms are coloured rich violet-blue and are of a very large size. This variety also is splendid for grouping in beds or for a position in the herbaceous border. Erigeron Amos Perry is a variety of somewhat prostrate habit, but great freedom of flowering, the flowers, which are of large size, being of a soft blue colour and produced in great abundance all through the summer until destroyed by frost. The variety B. Ladhams produces masses of orange-pink flowers during July and August. This also is a very showy plant and grows about two feet tall. E. intermedium is another excellent plant for the flower garden; it forms dense tufts of foliage from which arise numerous branching heads of soft lavender-blue flowers on stems some two and a half feet tall. This plant is in bloom from July to October.

The taller Erigerons provide splendid material for use as cut blooms in indoor decorations. *L.*

THE BULB GARDEN.

FRAGRANT TULIPS.

As the season for ordering bulbs is at hand, lovers of sweetly scented flowers should not overlook the Tulips. There may be several other varieties with which I am not acquainted, but the following three are very good, for, in addition to their delicious perfume they are excellent for bedding and other purposes.

La Merveille is a characteristic Tulip and very sweet; the flowers are of terra-cotta colour and produce a pleasing effect in groups and also when lightly arranged in vases. Gesneriana lutea grows rather taller than La Merveille, and its flowers are bright yellow, sweetly perfumed and most useful for cutting. Ellen Willmott, soft, creamy yellow, is also a very useful Tulip, apart from its sweetness.

For room decoration the flowers are best cut before they are fully open; in fact, I usually cut them when the flowers are just at the point of opening. There are numerous Tulips with charming colours, but few possess fragrance. *H. Markham.*

FIG. 34.—CAMPANULA HALLII: R.H.S AWARD OF MERIT, AUGUST 8. SHOWN BY MR. A. J. HALL (SEE P. 93).

THE ALPINE GARDEN.

EUPHORBIA POLYCHROME.

The season of this Euphorbia is over, yet it is worth while to mention it for the sake of those who seek after distinct hardy flowers to bloom in May and June. I saw it in perfection in one of the best private collections of hardy plants in the United Kingdom. It was unusually good there, and formed fine bushes about a foot high, freely covered with good yellow blooms of the characteristic form of the Euphorbias.

E. polychrome is hardy, and easily cultivated in ordinary soil in the border or rock garden. *S. A.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. Barker, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

Cattleyas, and Allied Plants.—The continued bright summer weather has suited this family of Orchids. Plants that are growing freely or developing their new pseudo-bulbs should be watered freely, provided the compost is in a sweet and healthy condition. As the growths mature on those varieties that take their rest between the time of making pseudo-bulbs and flowering, gradually reduce the water supply, taking care that they have sufficient to thoroughly develop their new pseudo-bulbs. All the members of this family that have recently flowered and are in need of new rooting material should be repotted whenever there are signs of fresh root action. Each species, and its hybrids for the most part, has a proper season for this operation, and at the present time Cattleya Warscewiczii (gigas) is perhaps the best illustration; having recently gone out of flower, it will be observed that new roots are pushing in quantity from the base of the newly-made pseudo-bulbs, and any plants that are in need of repotting should be attended to before these new roots attain any considerable length. These remarks also apply to plants which have completed their growth without producing flowers. At one time a difficulty was experienced in flowering this plant satisfactorily, which was, to my mind, attributable in the first place to repotting the plants in the spring, and the drastic withholding of water during the autumn and winter. The treatment now followed is more rational, and the plants produce flowers freely and of a much finer quality. The whole of the plants of this species will be better for being placed in a slightly cooler and drier position than they have occupied in the warm Cattleya house, exposing them to more air and sunlight, and they should only receive water when they become dry.

THE FLOWER GARDEN.

By C. Turner, Gardener to Emily, Lady Ampthill, Ampthill Park, Ampthill, Bedfordshire.

Bulbs for Naturalising.—Foremost place for this purpose must be given to the members of the Daffodil family, and their planting may be done successfully until mid-October—but the earlier these bulbs are planted the greater the chance of success. To obviate formality of appearance in grouping, merely throw the bulbs about the space to be occupied by them, planting them where they fall. Should the ground be of a sloping nature some intentional placing of bulbs will be necessary, otherwise they may roll too closely together, even when scattered about in a free-and-easy manner. Observe the rule to plant much deeper in light ground than in heavy soil—a rough guide being 3 inches deep in the latter kind of ground, and 5 inches or 6 inches in the lighter land. Other kinds of bulbs to be recommended for planting under trees and among shrubberies are:—Winter Aconite, Bluebell, Crocus, Snowdrop, Ornithogalum (Star of Bethlehem), Leucojum, Snowflake, Scilla and Trillium.

Lilium candidum.—Where this Lily is not doing well, the clumps may be taken up and replanted directly the flower-stems have died down. Do not plant the bulbs deeply, especially if the soil is on the heavy side, and bed each bulb in sand unless the natural texture is light and porous. Poor land should be first enriched with old manure, which should not be allowed to come in immediate contact with the bulbs. Fresh plantings of new bulbs may be made now. Where this Lily flowers satisfactorily it is wise not to disturb the bulbs.

Abelia rupestris.—The pendulous, blush-coloured blossoms of this choice shrubby plant are now expanded, and will remain pretty awhile. Excepting in the warmest localities this shrub needs the protection of a wall, light soil to grow in, and in severe winters a slight top protection. Another way to manage it in cold districts is to grow the plant in large pots through the dangerous period in a cold house, and then plunge the pot in a border out-of-doors for the rest of the year. The plant does not need much pruning; what is necessary should be done after flowering is over. Plants may be propagated from cuttings inserted now.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to J. A. Berners, Esq., Woolverstone Park Gardens, Ipswich.

Apples and Pears.—With good cultivation extra fine fruits are produced from pot trees, but the latter require more attention than those planted out. There is, of course, the advantage of being able to move them, if required, to any suitable position, where they will receive plenty of light and air, without which the fruits will fail to finish with high colour and good flavour. Some early Apples require gathering a few days before use, others may be eaten direct from the tree; Lady Sudeley, a fine early variety, belongs to the latter class. Most of the early Pears should be gathered before they become quite ripe, or they will be mealy or poor in flavour. Many of the French varieties are large in size and good in colour when grown under glass, and to extend the season some trees may be stood outdoors in a sheltered position to finish ripening. It is advisable to cover these with small-meshed netting to ward off birds; Tits are very troublesome, and it requires a small-meshed net to keep them out. Any necessary stopping and pinching should be attended to. As the trees are relieved of the strain of ripening their fruits they will only require sufficient feeding to assist in plumping up their buds. It must be remembered that the soil in pots containing a large number of roots soon dries out, and frequent inspection of pot trees for watering is necessary.

Wasps.—These are becoming troublesome, and unless means are taken to protect choice fruits much mischief will result from their depredations. By covering the ventilators with wasp-proof, hexagon netting they may be effectually excluded from vineries, etc. The serious objection to this method is that during a spell of hot weather the current of air is considerably curtailed, and consequently temperatures rise to a higher point than is good for the welfare of the vines, etc. Many growers "bag" their choice fruits. Various methods are used for trapping and destroying wasps, but the most effectual method is to destroy the nest, which may readily be done by using cyanide of potassium. By soaking a small piece of cotton wool in liquid cyanide of potassium, and inserting it in the entrance of the nest the wasps will be killed, and in the course of a few hours the nest may be dug out and destroyed.

THE KITCHEN GARDEN.

By R. W. Thatcher, Gardener to Mark Firth, Esq., Carlton Park, Market Harborough, Leicestershire.

Large Onions.—These will require a good deal of attention this month if fine bulbs are desired. Examine the bulbs carefully, remove all loose skin, and support any plant inclined to fall over. This will not take long, it greatly adds to the appearance of the bed, and facilitates hoeing and watering. Dust the bed with old soot during showery weather. Thorough soakings of water will be necessary if dry weather continues; work the hoe freely between the rows to aerate the soil, and prevent it cracking.

Endive.—Make a liberal sowing of seeds of this useful winter salad during the early part of the month, preferably on a south border. Water the drills before sowing, and afterwards rake the surface down to a fine tilth. Thin the seedlings to 1 foot apart as soon as they are large enough to handle, and hoe frequently between the rows.

Lettuces.—Ample supplies of water should be given to Lettuces, and young plants from recent sowings should be thinned as soon as large enough to handle, afterwards drawing a little soil up to the stems. A good breadth may now be sown on ground recently occupied by early Potatos; the plants will prove very useful during the autumn.

FIG. 35.—AVENUE OF YOUNG ROYAL PALMS (OREODOXA (ROYSTONEA) REGIA) IN A SAN SALVADOR PARK (SEE P. 101).

PLANTS UNDER GLASS.

By John Coutts, Assistant Curator, Royal Botanic Gardens, Kew.

Aristea corymbosa (syn. Kitsenia corymbosa).—This beautiful blue-flowered plant is rather unique, as it is really a hard-wooded member of the Irideae. It has always—and with good reason—been regarded as a difficult plant to propagate. During August is a good time to insert cuttings, the best material for the purpose being obtained from the base of the plant, where the short shoots, with their fan-like arrangement of leaves, are usually thickly clustered. They should be carefully detached by means of a sharp knife, retaining a small portion of the woody base. The cuttings should be dibbled in, not too deeply, into pots of sandy peat, standing the pots under bell glasses in a cool greenhouse. If the cuttings are carefully prepared and looked after, a proportion of them should be rooted by the following spring. When rooted they should be transferred singly to small pots filled with fine, sandy peat. As the plants become larger and are potted on the compost should be used in a rougher condition. Well-drained pots, and care in watering, are necessary at all times to grow this plant successfully, which will succeed quite well in an ordinary greenhouse.

Richardia africana.—Plants of the Arum Lily that have been rested in pots should now be shaken out and repotted, using a very rich compost, mixed with well decayed cow-manure, as

Digitized by Google

the plants are gross feeders. Where required for furnishing the benches, they are best potted singly into 6-inch or 7-inch pots. Where large specimens are required, three or four strong plants should be placed in 10-inch or 12-inch pots. After potting them the plants may be placed in cold frames, watering them carefully until they have made some top growth, and plenty of new roots. When in full growth they will take almost unlimited supplies of water and need liberal feeding. Plants that have been planted out for the summer should be lifted—during the beginning of September—and placed in suitable-sized pots.

Pelargoniums.—Those of the show and regal varieties that have been stood out-of-doors should now be cut back, using the shoots as cuttings if it is desired to increase the stock. The required number of old plants should be stood in cold frames, and when they have started into growth turned out, and sufficient of the old soil shaken away to allow of them being repotted into the same sized pots. During the winter they should be grown in a light position close to the roof-glass in any airy greenhouse.

HARDY FRUIT GARDEN.

By A. J. Hartless, Gardener to Major J. F. Harrison, King's Walden Bury, Hitchin, Hertfordshire.

Gooseberry Mildew.—Of the two forms of Gooseberry mildew prevalent in this country, the one known as American Gooseberry mildew is the more difficult to deal with. All shoots affected by it should be tipped and burnt, and the bushes sprayed with sulphide of potassium; a strength of 1 oz. of the sulphide to 3 gallons of water is usually recommended, but this may safely be increased to 1½ oz. as growth ripens. In carrying out experiments some years ago I reversed the quantities generally given, using 3 oz. to 1 gallon of water, with no ill results. Yet within a few miles bushes were denuded of leaves, by an ordinary application of sulphide of potassium. This fungicide will soon destroy the ordinary Gooseberry mildew at this season of the year.

Strawberry Beds.—The planting of new Strawberry beds should be done as ground becomes available; land previously prepared for Strawberries may be bearing a catch crop of vegetables at the present time. The plants should be placed at least 2 feet 6 inches between the rows and 2 feet asunder in the rows. It is a good plan to plant at 1 foot apart in the rows, with the object of securing a few good-sized berries the following season, and then to cut out the alternate plants with a hoe, thus allowing the usual space for the remainder, which will make big stools in their second year. Keep established beds well tilled and watered. Spraying will keep down the disease that sometimes affects the foliage. When removing nets from plantations, the size and condition of each net should be noted on a label, and attached to it

NOTES ON THE CULTIVATED PLANTS OF THE REPUBLIC OF SALVADOR.

(*Continued from p.* 88.)

The illustrations 35 and 36 (p. 100 and 101) show examples of the Royal Palm used as an avenue in a public park, and the Amate Tree in a street of San Salvador.

Especially worthy of mention is the home of Mr. Federico Klein, the most enthusiastic and progressive horticulturist in Salvador. Although only a small portion of his time can be devoted to gardening, he grows large quantities of flowers for his own entertainment and for the markets of the Capital. In his grounds are more than 800 Rose bushes of many varieties, besides selected Dahlias, Gladioli, Chrysanthemums, and other plants, all of which thrive under the intelligent treatment given them. He also has a good orchard of fruit trees of improved sorts.

It is an agreeable diversion to visit the markets of the larger towns and observe the quantities of flowers that are offered for sale. Most of those that supply the markets of San Salvador are grown upon the upper slopes of the volcano which overhangs the Capital. Early in the morning files of women stream into the city, carrying upon their heads wide, saucer-shaped baskets filled with vegetables, fruits, and other produce, and not a few of them bring baskets of flowers—white Lilies (Lilium longiflorum), Roses, bunches of fragrant Violets, and dozens of other kinds. In few places do Roses thrive so well as in Salvador, and although often they receive little care, the bushes are loaded with well-formed blossoms throughout the year. The prices they bring in the markets seem ridiculous in comparison with those of scarcely superior hothouse flowers in northern countries.

Many of the familiar garden plants of temperate regions are cultivated in Salvador, such as the Orange Day Lily (Hemerocallis fulva), Cockscomb (Celosia cristata), Bachelors'-Buttons (Gomphrena globosa), Four-o'-clocks (Mirabilis Jalapa), Carnations, Pinks (Dianthus chinensis), the California Poppy (Eschscholzia californica), the common Poppy (Papaver somniferum), Sweet Alyssum, at least one Spiraea (S. cantoniensis

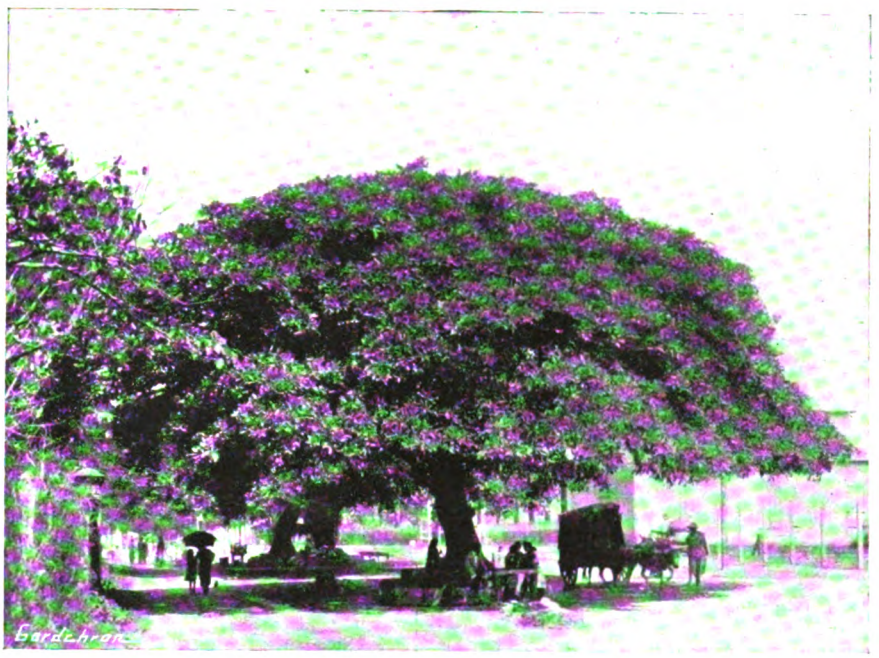

FIG. 36.—THE AMATE TREE (FICUS SP.) IN A SAN SALVADOR STREET.

var. lanceolata), Lupins (Lupinus hirsutus), Sweet Peas, Pelargoniums in variety, Touch-Me-Nots and Impatiens Sultani, Hibiscus syriacus, Pansies, Phlox Drummondii, Heliotrope, Verbenas, Coleus, Petunias, Cosmos and Scabiosa atropurpurea.

It may be noted here that two of these plants, Gomphrena globosa and Mirabilis Jalapa, are supposed to be natives of tropical America, yet I do not believe they have ever really been found wild. They must have been in cultivation for many centuries, but even so one wonders what has become of the wild forms from which they sprang. There are numerous other tropical American plants of which the same statements may be made.

Many of the cosmopolitan tropical plants are grown here, of course, among which may be mentioned: Zebrina pendula, in gardens and also wild along streams in the mountains; Asparagus plumosus and A. Sprengeri; Cordyline terminalis, including the form with purple foliage; Sanseviera guineensis, which is planted in hedges and readily becomes naturalised; Tritonia crocosmaeflora; Aristolochia grandiflora, frequent as a wild plant, and certain to attract notice because of its giant but ugly flowers; Antigonon guatemalense, a native vine with masses of pink flowers, quite as handsome as the better-known A. leptopus, with which it is easily confused; Iresine Herbstii, probably a derivative of that common weed, I. celosioides; Bougainvillea glabra, perhaps the favourite ornamental vine of tropical America; Sedum mexicanum, a pretty little plant with yellow flowers, probably imported from the Old World although it has not yet been identified with any species of that region, and is known only in gardens in Mexico and Central America; Hydrangea opuloides; Philadelphus inodorus and P. mexicanus; Caesalpinia pulcherrima, the most frequent ornamental shrub about dwellings in Mexico and Central America; Clitoria ternatea, a herbaceous vine with attractive large, blue flowers; Phaseolus Caracalla; Acalypha hispida, with pendant, red, ament-like flower spikes, and A. wilkesiana, the latter frequently planted for its coloured foliage, which is rather effective at distance; Codiaeum variegatum var. pictum; the well-known Poinsettia (Euphorbia pulcherrima, most gorgeous of tropical American shrubs, known locally as Flor de Pascua or Christmas-flower, because it is at its best about Christmas time; Euphorbia neriifolia, a spiny Old World species, planted for hedges; Jatropha podagrica, with bright red flowers and a curious bulb-like root half-exposed above the soil; Pedilanthus tithymaloides, which is often grown in hedges; Abutilon striatum, another supposedly Central American plant which is probably not known in the wild state; Hibiscus schizopetalus and H. rosa-sinensis, the latter in many varieties; Henna (Lawsonia inermis); Myrtle (Myrtus communis), Plumbago capensis; Jasminum grandiflorum and J. Sambac; Beaumontia grandiflora, a strikingly beautiful vine with large, pure white flowers that resemble those of the Daturas; Oleanders; Stephanotis floribunda; Clerodendron Thomsonae; Holmskioldia sanguinea; Datura candida; Solanum seaforthianum and S. Wendlandii, handsome vines with violet blossoms; Pandorea jasminoides, a slender Australian vine with white and purple flowers; Pyrostegia venusta, a creeper with orange-red flowers which is even more showy than the Bougainvillea and is one of the most popular ornamental plants throughout Mexico and Central American; Tecoma capensis, another showy vine of the same family; a Ruellia with purple blossoms; Sanchezia nobilis; Thunbergia erecta, a shy-blooming shrub, and T. laurifolia, an exceptionally handsome vine, its foliage almost hidden beneath masses of violet-purple flowers; Gardenia jasminoides; Ixora coccinea and I. finlayana; Mussaenda pubescens; and the Japanese Honeysuckle, Lonicera japonica. *Paul C. Standley, Assistant Curator, Plant Division, U.S.A. National Museum, Washington.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 5, Tavistock Street, Covent Garden, W.C.2.

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters, and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.*

No. 19.—The Salween River.

IT proved no easy matter to engage porters to go to the Taron, and quite impossible to engage an interpreter. The latter would have been of no use unless he went with me all the way to Hkamti Long—a month's march; and then he could not get back to the Salween for six months! No wonder the only available interpreter was reluctant. The season was well advanced—hence the difficulty with the porters also; but the weather had set in for a really fine spell, and after a good deal of talk, seven porters were engaged to accompany me for ten days, at one pound sterling a head. In order to economise food and transport still further—for there was no saying what difficulties might be encountered when the Taron was reached—my cook Lao Li returned to the Mekong; his job now was to escort my mules down to Ta-li and hand my kit over to friends, who would forward it to Burma.

On October 19, therefore, we set out once again, seven porters and myself, without cook, servant, or interpreter; but I was not going to let a detail like that interfere with my reaching the Taron, at this, the third attempt. The difficulties could be coped with as they arose; for the time being, with three of the Lutzu porters more or less conversant with Chinese, and willing to help me, I was content.

It was a lovely day. We dropped down the steep hillside to the stream a thousand feet below, through a tangle of grass and shrubs. Cornus capitata, a small tree, is common hereabouts, and its Strawberry-like fruits were almost ripe. The natives eat them, but, in my opinion, they are very insipid. There is a small bush Rhododendron, which grows on the sunny slopes hereabouts—R. sinovirgatum. It is common in the Salween valley itself on open banks where Pines and shrub growth flourish—not in the sheltered gullies choked with jungle. Sometimes it is no more than an undershrub, being very like R. racemosum in appearance, which, indeed, is a closely allied species. I have never seen R. sinovirgatum in flower; but it must have been prolific this year, for the plants were covered with healthy fruit. Seed was collected.

We lunched at a hut in the valley, and then started to climb the last spur separating us from the Salween river itself. From the top we had another glimpse of the Gompa La (see Fig. 37), its head muffled in cloud. The descent to the Salween is atrociously steep. The sunny slopes are scantily clothed with Pine, Alder and Oak, springing up from a sea of coarse grass, Bracken and semi-herbaceous plants — Compositae, Labiatae, Hedychium, Anemone, etc.; I have referred to it before. It is astonishing the amount of territory west of the Mekong which is covered with this formation. Once the eastern Irrawaddy is crossed, however, the Indo-Malayan jungle swamps everything.

The Salween valley here has eight months' rain in the year, and four months' fine weather—not all at once though. In the dry weather the atmosphere is still saturated, and heavy dews take the place of rain. Consequently, tree growth is the dominant feature. It is quite impossible to say what the rainfall is, but, no doubt, it is in the neighbourhood of 80 or 90 inches, to judge by the vegetation in the ravines.

On October 19 we crossed the Salween, and marched along the right bank to Tra-mu-tang. There were bushes of Rhododendron decorum, and whole thickets of R. sinovirgatum on the Pine-clad slopes. In the villages were thorny Quince trees and hedges, and Orange trees, though the fruit was not yet quite ripe.

FIG. 37.—THE GOMPA LA; SALWEEN-IRRAWADDY DIVIDE.

November is the month for Oranges, which, by the way, are green, but deliciously sweet and juicy for all that. Peach trees are common; but there is nothing else in the way of fruit.

Crossing the paddy terraces below the limestone escarpment of Tra-mu-tang next morning, we presently entered the Marble Gorge, and in a moment found ourselves in semi-tropical forest. There were Orchids on the trees and on the rocks, some of them in flower; the most striking was a species of Cirrhopetalum, its flowers arranged in the form of a wheel, the spokes being represented by the narrow, elongated labellums.

On the opposite side of the gorge, clinging to the sun-drenched cliff, were many small Palm trees, the first of the Indo-Malayan Palms; but I could not make out what they were.

It did not take us long to traverse the Marble Gorge, despite the fact that the path had been smashed to fragments during a terrific spate. In the summer the river had risen 40 feet here, and for weeks the gorge was impassable, though the path is high above the average water level. When at last the river dropped, there was no path left.

Just above the gorge a tremendous torrent comes booming down from the Irrawaddy divide, and hurls itself over a barricade of boulders into the Salween; it is the glacier torrent from the Gompa La, and up it lies the path to India.

We began by climbing a very steep, grassy slope, which in places was carpeted with a tiny creeping Fig, bearing very sweet, berry-like fruits. I found one, and enjoyed it; but the natives had already been over the plants and eaten most of them. The plant at first sight looks more like a Gaultheria, or some such thing, than a Fig.

After ascending some hundreds of feet, we reached a small village, and halted for lunch. We had a wonderful view, looking right down on to the Marble Gorge from here, half in sunlight and half in shadow.

We now continued the ascent, following a very narrow path buried in high grass. A small flowered Torenia grew by the patches of cultivation, the first of the genus, which is so prolific further west, in numbers, if not in species. A moment later we turned the shoulder, and entered a deep gorge.

We were now introduced to terrifying travel. The path—where there was a path—was a mere ledge along the face of the cliff, but it was complicated by being buried in the most luxuriant grass. What a place for the mules—if only one could have got them there! Once through the worst of the defile we came to masses of Luculia (presumably L. gratissima) in full bloom. The great, corymbose globes of pale pink flowers were most striking, and showed up splendidly against the dark green vegetation. The flowers, of course, are deliciously fragrant; unfortunately, they wilt very quickly after being plucked.

Crossing a deep ravine, where many forest trees grew, I came upon several ground Orchids, and then my whole attention was absorbed in the first tree Rhododendron; the pale coppery-red, glass-smooth trunk was unmistakable, though it was a long time before I could find any fruits.

It proved to be one of the Oxyphyllum series, of which I had found one species in 1921, in southern Yunnan. That, however, was a bush. This was a tree; and no mean tree either, growing 30 feet to 40 feet high, though slender, and not much branched. The loose truss, with only three or four flowers, is characteristic; but the character by which one can most readily recognise the group is the queer fruit, a long, slender curved capsule which opens by bulging in the middle, the valves separating from the central column midway between base and apex; so that the ripe capsule appears to be beaked. The seeds are few in each valve (KW. 5425).

The glabrous leaves and slim-pointed buds are also rather typical; but in the depths of the forest, where you cannot tell one tree from another, you could always distinguish this Rhododendron by the smooth, almost glossy, chestnut-purple stem, without a rag or a tatter of bark flying from it, and without a Fern or a sprig of moss even adhering to it.

Late in the afternoon we reached the last Lisu village, and halted for the night. On the morrow we would begin the serious ascent of the Salween-Irrawaddy divide. *F. Kingdon Ward.*

* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, 29, 1921; January 7, 21, March 11, 25, April 8, 22, May 6, 20, June 3, 17, July 1, 15, 22, August 5, 26, September 9, 23, October 7, 21, November 4, 18, December 2, 16, 30, 1922; January 13, 27, February 10, 24, March 10, 24, April 7, 21, May 5, June 2, 23, July 7 and 21, 1923.

Imports of Shelled Walnuts.—It is not generally known that dried, shelled Walnuts are largely imported from China, where the trees are planted generally to furnish shade. The shipping season commences in September, and in the north of China most of the nuts are sent to Tientsin; they are exported either in the shell or shelled. Shelled nuts are transported to the shipping ports in thin wooden boxes, holding fifty to one hundred pounds each, but before final shipment they are graded in three sizes. As with most of the commodities exported from China, states the *Journal of the Royal Society of Arts*, the producers of Walnuts receive but little of the profits. At the beginning of the harvest season, the local dealer contracts with the farmers for the crop, and later sends it to Tientsin and other ports, where wholesale dealers take it over.

KINGCUPS.

First of all, what is the Kingcup? At one time I would have thought this query to be superfluous, believing the plant to be Ranunculus repens. But there are not a few people who use the term to embrace a larger number of plants, and some confine it to the Marsh Marigold. The name may be old, but I have not found it among very old names, so that if it is old, it was not a common name. I think the beginning of the sixteenth century is the limit one must determine, though Gerarde states that the very similar "King Cob" was old in his time, and we have from him these variants, King Kob, King Knap and King Knop, and very probably one or other may be the original form, and not "Cup." On referring to Dr. Prior's *Popular Names of British Plants*, Cob is stated to be derived from Copp, a head; and Knop from Cnaep, a button, both from the bud and the double flower being like a button as worn by kings. King, it may be remarked, is put in the possessive case by Prior, without any apparent cause.

It is unfortunate that not a few definitions in this very learned book are spoiled by inaccuracies, and that happens in the present instance. Lyte defines a "Knoppe" thus: "After the flowers there come up rounde heads or buttons, more rougher than the Knoppes of water crowfoote." So that while it is correct to state that the word refers to buttons, it is clear that it is the many-seeded carpels, and neither buds nor flowers, to which the name applies. Gerarde provides a much better history of the word than Lyte. He refers it to one of two Ranunculi, or perhaps to both. One is Ranunculus repens, "Common Crowfoot," the other R. acris, "Right Crowfoot." But "right" here does not mean "true," but is simply the translation of the Latin *R. surrectis cauliculis*. It is to these two plants that Gerarde applies the names of King Kob, Gold Cups, Gold Knobs, Crowfoot and Butter floures. The assumption that King may be descriptive of the cob or button, seems rather far fetched, and is one of those names that may never give up its history. I find a curious use of "Kings" in Lawson's *Country Housewife's Garden*, in which, treating of Parsnips, it is noted "the Kings (that is in the middest) seed broadest and reddest," meaning that the finest seed is produced in the central part of the umbel. But I would not suggest that "King" in the instance under review predicates a superior kind of Crowfoot; though it may. Culpepper seems to refer King Knob to Ranunculus repens, which he states is the "yellowist flower he ever did see."

Let us now see what poets and others consider the plant to be, which may be gathered from the plants it is associated with. I will leave out Spenser and begin with Gay. "Fair is the Kingcup that in meadow blows. Fair is the daisie that beside her grows."

Cowper is equally clear where he tells of Children who "Gather the Kingcup in the yellow mead, And princk their hair with daisies." How convincing, too, is Sir Walter Scott, where he tells of Jeannie Deans, "thinking on the bonny spots of turf sae fu' o' gowans and yellow Kingcups among the craigs at St. Leonards." To mention Wordsworth is to call to mind involuntarily: "Pansies, Kingcups, Lilies, Daisies." No commentary is needed in any of these instances.

It may be news to some that the familiar Buttercup is comparatively a novel appellative. Butterflower, as we have seen, is old, and remained in current use for a long time, as appears from Gay's line: "Let weeds instead of Butterflowers appear," and it, and not Buttercup, is found in Johnson's *Dictionary*. "Butter" has given rise to some controversy; Dr. Prior, to quote again, derives the word from "bouton d'or," thinking that butter is a corruption of button, but were that the case the full designation could scarcely be "butter floure," unless there was originally a double form common, of which there is no record. From the play of children, the true conservators of traditionary customs, may we not obtain a hint? One may still observe a child putting the fully expanded flower of a Buttercup under the chin of a companion, in order to discover if he or she "loves butter." The children know that a faint yellow hue from the flower will be assumed by the skin, and this peculiarity of a shining greasy butteriness on the petals is probably the true origin of the name.

Then there are Bachelor's Buttons; Lyte mentions R. acris fl. pleno by that name, and five years earlier Tusser lists the flower. Gerarde, too, mentions it, having found a wild specimen. While in a chapter "Of double yellow and white Batchelor's Buttons" he describes and illustrates a double form of R. bulbosus, with secondary and tertiary flower heads proceeding from the primary head. A second is a double R. repens, discovered in Lancashire, and a third R. aconitifolius fl. pl., now known as Fair Maids of France, perhaps the flower of the nursery rhyme:—

"Mistress Mary, quite contrary, how does your garden grow,
With cockleshells and silver bells and Fairmaids all of a row."

These were all common well into last century, though they seem now to be but little grown.
R. P. Brotherston.

PLANTS NEW OR NOTEWORTHY.

RHODODENDRON FRASERI.

A plant of this beautiful and interesting hybrid Azalea (Fig. 38) has flowered freely in the Arnold Arboretum this spring for the third year in succession. Rhododendron Fraseri* is of Canadian origin, having been raised by Mr. G. Fraser, of Ucluelet, Vancouver Island, British Columbia, by crossing Rhododendron canadensis with R. japonicum. The young plants flowered for the first time in 1919, and the same year Mr. Fraser sent a living plant to the Arnold Arboretum. The flowers are a pleasing shade of light rose-lilac and slightly but pleasantly fragrant. The habit is good and the plant is very floriferous. It seems to be perfectly hardy and promises to be a very useful addition to the spring garden. *E. H. Wilson, Arnold Arboretum, Harvard University.*

* W. Watson in *Gard. Chron.*, ser. 3, LXVII., p. 225 (1920).

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM PURPLE EMPEROR PITT'S VARIETY.

A flower from the small plant of this model variety, which is excellent in size, shape and colour, shown by H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), in its fading condition discloses the fact that the deep violet maroon which spreads over the whole of the segments, except for the thin, silver-thread-like margin, is body-colour and not surface colour as in most hybrid Odontoglossums, which have invariably the colouring displayed on a whitish ground. The whole of the tissue in the flower of this form of O. Purple Emperor is of the same uniform dark colour, the reverse side of the segments being as dark as the front.

LAELIO-CATTLEYA NANON.

The first flower of the new Laelio-Cattleya Nanon from the raisers, Messrs. Cowan and Co., Southgate, while proving a very fine addition to the Laelio-Cattleyas, also gives an instructive lesson in hybridising with a preconceived purpose. It was obtained by crossing Laelio-Cattleya Ivanhoe (L.-C. eximia × C. Dowiana aurea) again with C. Dowiana aurea. The Veitchian L.-C. eximia of 1890 was obtained by crossing C. Warneri and L. purpurata, and, like most crosses with L. purpurata, had the defective narrow sepals of that species. The repeated crossing with C. Dowiana aurea and the influence of C. Warneri has resulted in a noble flower of the true, large-flowered Cattleya type. Although borne on a very small plant the bloom was nearly eight inches across. The sepals and petals are light rosy mauve, with a delicate silver veining; the median area of the broadly-expanded labellum, which is ruby-purple in front, is golden-yellow with closely arranged yellow lines from the base.

FIG. 38.—RHODODENDRON FRASERI

LINDLEY MEDAL FOR MR. FARNES.

In addition to the Gold Medal and Cain Cup awarded to Pantia Ralli, Esq., Ashtead Park, for his noble exhibit of Orchids at the Chelsea Show, which was adjudged to be the best exhibited by an amateur (see *Gard. Chron.*, June 2, p. 303), the Council have added a Silver Lindley Medal for Mr. Farnes, Mr. Pantia Ralli's highly successful Orchid grower, to mark their appreciation of the fine cultivation shown by the plants exhibited individually and collectively. The collection in Mr. Farnes' care compares favourably with the best in the country

HABITS OF INDIAN WORMS.

With the exception of one or two very instructive allusions in Darwin's *Vegetable Mould*, hardly anything has appeared in English on the bionomics of worms in India. It is exactly 40 years since Beddard laid the foundations for their study on scientific lines, and during the interval a hundred pamphlets, papers, and volumes more or less directly connected with the subject have appeared in various European languages. Two Italian, three French, and three German zoologists have added their contributions, while in quite recent years half a dozen native students have been trained to observe and report on the structure and habits of Indian Oligochaets. The work has at last borne fruit, and the Secretary of State for India has authorised the publication of volumes on the Fauna of our great Dependency. From the latest of these, viz., the *Monograph on Oligochaeta* by Dr. Stephenson, we are able to cull some items of peculiar interest. There are about 350 species of worms at present known to occur in India, Ceylon, and Burmah, and, as many of these are found widely distributed throughout the East, their interest is not limited to any one region. Of these about 40 are minute water worms; of pot worms or Enchytraeids there are but five species, though in Great Britain they may be counted by the hundred; and of earthworms such as we find in this country about a dozen species occur. In round numbers there are 300 species of which we have no representatives in our fauna, though specimens may be found at Kew and elsewhere imported in soil with plants from Eastern lands.

Dr. Stephenson devotes four pages to "the few and scattered observations on the bionomics of Indian Oligochaeta," which he has made or discovered, arranged under three headings. These are seasonal variations, habitats, and commensalism, and are not without significance for the gardener and agriculturalist. The only observations on variations in the number of worms found at different seasons of the year are those made by a native student, Baini Prashad, on the Earthworms of Lahore. Curiously enough, those observations refer largely to worms such as we find in this country, which, in the somewhat severe winter of Lahore, can continue their operations when the exotic species are quiescent. A good many species are semi-aquatic. This habit is greatly to their advantage in such climates as we find in Asia. When they could hardly survive elsewhere, they can thrive in water and moist situations, "in the leaves of water-plants, under stones, or in mud by a tank, in the hollows of trees, in accumulations of dead leaves and in rain-water."

Just as we find species in this country which are partial to decaying trees, so a number of native species have been found in India in rotten wood. "A more curious habitat, however, is adopted by a number of worms—the bases or axils of the leaves of trees at some distance above the ground." One of these, for example, has been found at the base of the leaves of a tall Palm tree in the Museum compound at Calcutta, or, again, at the crown of a Palm tree, on which account it has been named Palmicola, recalling Dendrobaena, another familiar name for a genus of worms. Specimens of a Perionyx have been taken at a height of 10, 15, or even 20 feet, at the base of the leaves of the Screw-Pine and Plantain. In my forthcoming little work on British Earthworms will be found a plate illustrating the gymnastics of certain worms, which fits in with Dr. Stephenson's quotation (p. 35) respecting another species of Perionyx, which is "a very strong little worm; the name *saltans* referring to its power of leaping in the air when touched." Yet another form was found coiled up on leaves in the dense jungle, forming a compact gelatinous mass. When touched, the worms sprang to life, performing somersaults and other acrobatic feats.

It is chiefly among the fresh-water worms that we find in India and elsewhere illustrations of commensalism. In this country we are familiar with the association of the worm Chaetogaster with fresh-water snails. In India not only does this occur, but species are often found associated with sponges, "apparently feeding on the decaying organic matter of the sponge and assisting in their movements in releasing numerous gemmules. In so doing they undoubtedly assist in the dissemination of the species." In this country it is no unusual thing for certain species of pot-worms (Enchytraeids) to live in association with various earthworms, and other co-partnerships might be mentioned. The volume of upwards of 500 pages devoted to the Oligochaeta, or land and fresh-water worms of India, is a valuable aid to our knowledge of the fauna of the East. *Hilderic Friend, Solihull.*

THE AVONDALE FORESTRY STATION.

The *Journal* of the Department of Agriculture, Ireland, for May, 1923*, just published, contains an important article by Mr. A. C. Forbes, on the progress of the Forestry Station at Avondale, in Co. Wicklow. Here a large number of plots, mostly one acre in extent, were planted in 1905-1906, all the important species of forestry trees being represented. The manner in which the plots were laid out, and general details of the soil, climate, etc., at Avondale, have been published in the same *Journal* for October, 1913. Some idea of the results obtained may now be quoted, but the attention of all foresters and woodland owners is directed to the article itself, which is replete with information on the rate of growth, liability to frost, and other points of silvicultural interest. There are four illustrations, showing plots of Sitka Spruce, Japanese Larch, and European Larch, mixed with Chestnut.

Spring Frost.

The species most affected by spring frosts after April were Silver Fir, Spanish Chestnut, Ash, Oak, Sitka Spruce and Douglas Fir. Beech escaped serious injury in most years, although regarded as a sensitive species. Their effect upon the permanent development of the plants was worst in the case of Silver Fir, Douglas Fir and Ash.

Species rarely or never injured were Abies grandis. Abies Nordmanniana and the various Pines, while the hardy broad-leaved species, such as Birch, Alder, Poplar, Sycamore, Hornbeam, etc., were, as usual, immune.

Nurse Trees.

The general statement may be made that Larch has proved too fast growing for the majority of broad-leaved trees, and requires early attention in the way of thinning and side pruning when used with the majority of them. The same disadvantage has been found in the case of common Spruce, which grows almost as fast as Larch, but is not so easy to side prune and is difficult to thin satisfactorily. Scots Pine as a nurse tree has not proved satisfactory.

Broad-leaved Trees.

The broad-leaved genera to which most importance can be attached are Maples, Elms, Oaks, Beech, Hornbeam and Spanish Chestnut. Of the Maples, Sycamore and Norway Maple show little difference in height growth, both being from 16 to 22 feet in height. None of the American Maples have done particularly well, the summers being evidently too cold for their normal development. Amongst Elms the "Chichester" Elms have made the most vigorous growth, keeping pace with the Larch nurses, but are inclined to fork. English and Wych Elms have also made satisfactory growth, but the American Elm has not given good results. Beech and Hornbeam, planted pure, are growing into thick, healthy crops. In mixture with Spruce these species have been almost entirely suppressed. Mixed with Larch they now form a second storey, which will probably be able to survive with normal thinning of the taller species. Spanish Chestnut has not proved satisfactory, suffering from spring frost.

Of the various Oaks used, Quercus pannonica has given the best results as regards height growth, being now 15 to 20 feet. Of the common Oaks, both sessile and pedunculate have succeeded fairly well.

Of other broad-leaved species Ash is the only one which is worth mentioning. This species suffered badly from spring frost during the early period, but is now making vigorous growth in most places. In some respects the most vigorous broad-leaved tree has been Prunus serotina, planted on a very poor and dry gravel. Its branching habit does not recommend it for timber production, but for poor dry soil it will probably give better results when grown for shelter than most deciduous species.

Conifers.

The chief interest lies in the growth of a number of Conifers, which are better suited to the climate than broad-leaved trees. Seven species of Silver Fir were used in the original planting scheme, and the only absolute failure is the common European species, Abies pectinata. This was used as a nurse, but entirely failed in its object, being repeatedly cut back by spring frost, and large numbers were killed out altogether. The outstanding plot in this section is Abies grandis. This species has not shown the slightest injury from frost, insects or fungi. Of the trees originally planted on one acre, 612 still remain, and have reached a height of 30 to 40 feet. Leaving out two outside rows, which have received more light than the remainder, the 467 trees standing on the remaining three-quarters of an acre now show a volume of 1,167 cubic feet, or an average of 97 cubic feet per acre, per annum, since the date of planting. At a planting distance of eight feet they are fairly satisfactory as regards cleanness of stem and suppression of side branches. A species planted on a limited scale in 1915 was Abies Veitchii, and judging from its growth so far it appears likely to approach Abies grandis in health, although growing at a slower rate.

(*To be concluded.*)

TREES AND SHRUBS.

LONICERA DELAVAYI.

This Lonicera was at its best at Kew during the early days of August, and presented a very attractive and graceful display of flowers. Considering it has been under cultivation for a number of years it ought, long before now, to have become more commonly listed in nursery men's catalogues.

It belongs to the group with long twining growths, some of which made this year are a metre or so long, therefore it is of indefinite height, and would be useful to clothe rustic supports, pergolas, etc. The young growths are light green and furnished with fine hairs which seem to disappear after the first year. The leaves are in opposite pairs; ovate, oblong-lanceolate with cordate base, 4-8 c.m. long, 2-3 c.m. broad, on short petioles 3-4 m.m. long. They have a dull green upper surface with glaucous-grey indumentum beneath.

The flowers are borne in pairs on short, straight, wiry stems, 2 c.m. long, produced from the axils of leaves towards the ends of short and medium current season's growths; I have counted flowers from as many as ten pairs of leaves. The corolla tube is a little thicker than an ordinary knitting needle; 8 c.m. long, with lobes that curl backwards; the inside of the tube is coated with hairs. The stamens protrude well through the corolla tubes, and the style is even longer. Fruits I have not seen. The colour of the flowers is pale yellow, which deepens. The blooms have a sweet fragrance, which is not so strong as in L. japonica, but they have a more refined appearance than those of the latter species. *C. F. C.*

THE MEADOW SAFFRONS.

Colchicums, or Meadow Saffrons, are frequently called in error "Autumn Crocuses," whereas they are distinct from the true Crocuses of autumn, and the flowers less refined. Yet they are worthy a place in the garden of hardy flowers, because of their beauty and value at a season when low-growing bulbous plants are scarce, and as helping to redeem the front of the border of perennial plants from some of the dulness caused by there being few hardy perennials of dwarf habit in bloom in late autumn. They are also desirable for growing in grass or in the wild garden, although they should not be planted in places to which cattle have access, for the leaves of Colchicum autumnale have been known to poison cattle which have browsed upon them, and probably the other species would have the same effect where such animals have access to the foliage, which develops in spring. The chalices and cups of some of the Meadow Saffrons are very beautiful, and, as the foliage seems immune to the attacks of rabbits, their utility is obvious in certain places frequented by these animals.

The Meadow Saffrons have pleasing flowers, supported on long tubes, and it is desirable to grow them through dwarf herbage, which not only preserves the blooms from being splashed through heavy rains, but it relieves the bareness of the flowers when on uncarpeted ground. The plants will grow in any soil, but have a preference for ground which is not too light and is fairly moist. They do well on light, dry soil, but they do not attain the large size of those grown in richer earth.

Our native Colchicum autumnale, which is often found in some English meadows, rendering these sometimes less valuable as pastures at certain seasons, is the smallest of the autumn-flowering species. It is one of those which have a special need for the support of a carpeter, as it has long slender tubes, and if not supported by low herbage, such as that of some of the Mossy Saxifrages, Arabises or Aubrietias, is frequently blown over by the wind or laid prostrate by heavy rains. In grass it is quite pleasing with its rosy-pink or purple flowers, with white tubes.

There are several varieties of this species, including a white one, C. a. album; a small claret-purple one, called atropurpureum, and a fine large variety sometimes called byzantinum, but generally named autumnale major in catalogues. It is a good rosy-purple flower of much charm.

In addition there are three at least with double flowers, and with strap-like segments arranged in rosette style. These are very pretty and useful plants, and last long in bloom. There is a scarce but lovely ivory-white one, C. a. album plenum, and two double varieties with coloured flowers. The typical C. a plenum has purplish flowers; and the second, C. a. roseum plenum, has fine, double, rose-purple blooms.

Colchicum Bornmuelleri.—This is one of the finest of the autumnal Meadow Saffrons, and has much larger flowers than any of the foregoing. It is also early, and its flowers begin to open whitish, and then gradually pass off to a fine lilac with a white centre.

Colchicum cilicicum.—I do not think that this species is specially needed seeing there are many others; but it may be described as a large-flowered, pinkish-purple species with a little chequering visible on the flowers. It is not common, and is quite a good species, though not of special interest to those who are desirous of having only a few of the best Colchicums.

Colchicum giganteum.—Much has been said in favour of this Meadow Saffron, but it is so near C. speciosum that both need not be grown. The main recommendation is that it is later than C. speciosum, and is therefore desirable for prolonging the Colchicum season. It has large dark-lilac or purple flowers of considerable size.

Colchicum speciosum.—In the forms of C. speciosum we have some of the indispensable Meadow Saffrons. The type itself and its varieties have all large blooms reminding one of a small single Tulip of good substance. The type has purple flowers with a white tube and a white centre. A splendid variety, C. s. rubrum, has the tubes purplish or purple-red, as well as the segments, and is a desirable plant. There is also a very fine form, with deep, ruby blooms and tubes, which is sometimes offered under various names. It is not plentiful, but is very desirable. The white variety, C. s. album (see Fig. 39) is a gem, with big, massive, ivory-white flowers of extreme charm, and the plant is a good doer.

Colchicum variegatum.—The last, I may mention, although there are a few others in cultivation, is Colchicum variegatum, with distinct purple chequering on a pinkish purple ground. It is very distinct, and should be grown in addition to some of the others. There is a deeper coloured variety, also chequered, which is often called C. variegatum atropurpureum or purpureum. I prefer the lighter-coloured one, as showing the chequering better on the lighter ground colouring.

All of these Meadow Saffrons are quite hardy, and may be flowered this autumn if secured at once, and planted by the first week in September. I have planted them as late as November, but August and the first week of September are the times I prefer. In good soil they may be planted at a depth of 3 or 4 inches; in light earth 5 or 6 inches deep, and in heavy clay 2 or 3 inches deep. In all cases the crown should be the depth stated below the level of the ground. These plants require to be lifted after a few years; if the clump is not flowering well, this operation being done as soon as the leaves become brown, when the corms may be lifted, divided, and replanted at once if convenient. *S. Arnott.*

FIG. 39.—THE WHITE VARIETY OF COLCHICUM SPECIOSUM.

VEGETABLE GARDEN.

LEEKS.

As the labour supply in many large gardens is somewhat short, the following cheap and quick method of growing a good breadth of Leeks may be of interest to growers. Presuming a crop of Broad Beans or Peas is almost over, pull up the plants, and, if possible, burn them on the site. Hoe the ground and clear the weeds from it. Mark out the land and begin at one side by drawing a shallow drill. With a light, hollow iron bar make holes 4 inches to 6 inches deep, and 9 inches apart in the drill; follow on with the Leeks, dropping one in each hole. Fill the hole with water and enough soil will settle about the roots to start the plant. Move the line again, and repeat the operation, keeping the rows 1 foot apart. In about three weeks from planting it will be necessary to use the flat hoe, and hoeing will serve the dual purpose of killing weeds and earthing up the growing Leeks. *G. W. Stacey.*

CAULIFLOWERS.

Of the varieties of Cauliflowers raised from seed sown in the autumn, Large Dwarf Erfurt (which followed Late Queen Broccoli) is one of the best sorts for wintering in frames, as its growth is dwarf and compact, and the heads well protected by the leaves. First of All is a little later, and closely resembles the former and Autumn Giant. In hot seasons this last is not very satisfactory, as many of the plants go blind.

Our spring-sown Cauliflowers were Express, which made very small heads; First-Crop, which gave small, compact heads; Magnum Bonum and All the Year Round, medium-sized heads of which we are now cutting; and Autumn Mammoth, with Autumn Giant to follow later. These were all planted on an east border, the soil of which was well prepared.

Where a supply of these vegetables is required through the summer, sowing a small quantity of seed of several varieties is better than making large sowings of one or two sorts, as it admits of a better chance of maintaining a succession. *A. B. Wadds.*

SPRING CABBAGES.

Interesting results may be gathered from the account of the trial of spring Cabbages undertaken at the Somerset Farm Institute at Cannington, near Bridgwater, under the auspices of the Somerset County Council. Sowings were made on two different dates and planting was also done on different dates. Apparently the best results were obtained from plants sown on July 31 and planted on September 22, 1922. Of this crop the best variety was Flower of Spring, for out of one hundred heads there were only four heads as waste. Late planting would appear to be unsuited to this variety, as forty out of the one hundred Cabbages planted on October 14 were not cut. Late sowing also seemed to be much against this variety, as the report states that ninety out of a hundred from a sowing made on August 21 were not used; similar results were shown with the varieties Offenheim, Ellam's Early, Emperor and Imperial, four of the most popular varieties grown. Mein's No. 1, also a good variety, does not show these extremes of variation, and if this feature is consistent, states the report, it may be a special recommendation to these varieties for field culture where conditions of cultivation are somewhat rougher.

ECONOMIC FRUIT CULTURE.

I AGREE entirely with the article signed *G. H. H.*, on p. 44 in *Gard. Chron.*, July 21; where there is land available it certainly is far the best plan to plant fruit trees by themselves, and not in the general garden. Trained trees are valuable for the production of early or choice wall fruit, and have a value in small gardens, such as are usually attached to houses in towns, and in such positions provide the amateur gardener with an interesting occupation for his leisure hours, but this method of growing fruit does not pay commercially. I once read a series of articles in a leading commercial fruit journal describing an elaborate method of fixing posts and wires to which cordon fruit trees could be trained, and it was highly recommended as a commercial proposition despite the great cost of the supporting wires and stakes, and of the trees. I have no hesitation in saying that it would be a very bad commercial adventure. These trained, restricted trees require an enormous amount of labour in pruning, and it requires also a good deal of labour to keep down weeds. Such trees might give crops more quickly than bush trees, but would certainly not pay so well in the end.

I am very strongly of the opinion that where the land is good there is eventually no better method, from an economic point of view, of growing Apples, Pears, and other orchard fruits than in grass land. The trees should not be planted too thickly, but so far apart that when fully developed they all have an abundance of light and air, and plenty of room to take a vehicle amongst them for collecting the fruit, spraying, etc.

We all know what a nuisance it is to have to convey tree prunings out of an extensive orchard, but in America they get rid of this trouble by running an iron car through the orchard into which the prunings are thrown and burned, as the car moves along. When we grow trees in grass we get rid of the labour of constant cultivation, and such animals and birds as sheep, pigs, geese, and poultry, if allowed to run amongst the trees, manure the ground, and keep the grass short, saving a big labour bill, and giving extra profit too.

The trees should not be of a lesser height than half standards, and, where animals are allowed to enter, the trees will need protection for their stems when young. Geese are, perhaps, the best graziers for orchard purposes; but they must not be put amongst low-stemmed trees; about four geese to an acre is ample, and, perhaps, too much as a regular thing, as they need a lot of grass. The geese that I kept would eat nothing but grass, refusing to touch meal of any description, but any Apples within their reach were quickly gobbled up.

In countries abroad fruit trees are often planted on land too poor for tillage, and do very well on it; but certainly the trees will live longer and grow larger on good soil. Poor soil will be vastly enriched if animals run over it constantly; failing animals it is certainly an excellent plant to top-dress the grass with manure, and when the grass is cut to let it lie and rot. Orchards in grass have been condemned by hasty observers, whose ideas have been formed after seeing old orchards that were not pruned, sprayed, or manured for 100 years. I have seen such orchards, yet they gave good fruit sometimes. Orchards in grass are more beautiful than cultivated orchards, and may be quite as effective and more economical. I am informed that Alfalfa or Lucerne is grown in some of the orchards in Virginia, a country famed for its fine Apples.

As regards the shaping of the trees, an open head should be aimed at, but there should be no time wasted in endeavouring to make each branch a cordon, as many have advocated. An open-growing tree is the best for full fruit production, and its formation and care involve the minimum of labour. It is only by avoiding needless expense that the fruit grower can show a good balance-sheet, but he must not avoid necessary expense in spraying, etc. *W. J. Farmer, Ye Hire, Redruth.*

BLACK CURRANTS.

FERTILISATION AND TYPE GROUPS.

THE Black Currant is probably one of the most important fruit crops grown in this country; but owing to "reversion" and "big bud," many plantations have been grubbed up and destroyed.

As in the case of the Red Currant, it will be found that the stigmas and anthers are both mature at the same time, and the flowers are both self- and cross-fertile.

When a bee visits one of the flowers, it will be found that the anthers which have opened on the inner side are bound to be brought very close to the stigma by the movement of the insect, with the result that the pollen dust is shaken on to the stigma, as well as on to the bee's head.

Many experts are of the opinion that those varieties which crop most heavily owing to their flower formation are specially liable to big bud, whilst varieties which, under normal conditions, are more resistant to this pest, often possess a high percentage of flowers which require insect pollination. When making new plantations, therefore, those of the latter section should be planted in sheltered positions exposed to the full sunshine in order to encourage as much insect activity as possible.

Black Currants may be readily divided into red-bud, and white-bud types. Amongst the former, Boskoop Giant, the fruit of which seldom hangs at all well on the bushes, is very early in ripening. Seabrook's Black, Mammoth and Merveille de la Gironde are excellent sorts which come under the heading of French Black. In the case of these red-budded types it will be found that the bud scales are very closely wrapped together, and this may account partly for the immunity of these varieties to big bud. This is a very interesting and important point, and readers of this article should consider whether it can in any way be applied to their own plantation.

In the case of the white-bud types, such as Baldwin and Goliath, the scales are much more loosely wrapped together, and it is, therefore, easier for the mites to attack the buds. *Enthusiast.*

REVERSION.

THE Black Currant situation is very serious indeed. I have yet to see a plantation where reversion is not rampant, though the growers do not always recognise any but the most completely affected bushes. This makes it difficult to know where to go for fresh stock.

Whilst the scientific men who are investigating reversion are unable, so far, to suggest the cause, except that they believe it to be connected in some way with bud mite, it may seem futile for a mere grower to air his views. But it seems to me that a check of any kind brings on reversion. I find that bushes transplanted when three years old or over generally revert, and so do old bushes that are cut back severely. Of late years young rabbits have taken to nibbling off the green shoots of newly-planted bushes; and I notice that all these revert. It seems possible that any check may be the cause, no matter whether from bud mite, severe drought, hard pruning, or the disturbance of roots.

The soundest lot of young bushes I have are some that were planted out as yearlings in the winter of 1921, and made an extra good start during the following moist season. Even here there are a good many reverted bushes. These will be taken out and the spaces filled by inserting cuttings. I have an idea that it may be best to avoid the check of transplanting by striking the cuttings where they are to stand. Why should not Black Currants be grown almost as a hedge? Cuttings could be put in one foot apart in single lines, the plants cut back once, and then allowed to crop. Reverted specimens could then be pulled out without making a serious gap; and all wood that had fruited could be cut away every year, so that the rows would always consist entirely of new wood. The plan is worth trying if it has not been tried already. *Market Grower.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante, pp. 71-76.)

(*Continued from page* 90.)

ENGLAND, N.E.

DURHAM.—Caterpillars have again completely destroyed our Apple crop; all the blossom was consumed before it opened. Pear trees at one time looked fairly promising, though weak in the flower, and the wretched weather at the time of blossoming spoiled the flowers. There never was a worse season here for all kinds of pests; hundreds of trees in the woods are quite leafless. *Edward Tindale, Ravensworth Gardens, Gateshead.*

——The fruit crops are, generally, very good, with the exception of Pears. Undoubtedly the Plum crop would have been much over the average, but for late frosts and cold, north-easterly winds when the trees were in full blossom. Small fruits are exceptionally heavy crops and of very good quality. Strawberries were very late in ripening. Pears have never been a success in these gardens. Our soil is of a light sandy nature, with a sandy subsoil. *J. A. Woods, Beamish Park Gardens, Beamish, S.O.*

NORTHUMBERLAND.—We have the worst crops of Apples, Pears, Plums and Cherries that I have ever seen. What few fruits we have are in good condition. All fruit trees developed plenty of blossom and fruits set freely, promising good crops, but frost and cold east winds for nearly three weeks caused the fruit to turn quite yellow and drop. The soil in these gardens is rather heavy, but has no great depth, and overlies free stone, and fruit trees never do well for any length of time. *William McCombie, Newton Hall Gardens, Stocksfield-on-Tyne.*

——The fruit crops were ruined by the very cold spring, the cold weather continuing until the end of June. Pears and Plums are scarce; Apples are poor, with the exception of a few late-flowering varieties, which have fair crops. Black Currants and Gooseberries were satisfactory, and Strawberries promised well, but needed rain. The soil here is on the gravel and of fairly good quality. *James Winder, Howden Dene Gardens, Corbridge-on-Tyne.*

——The Apple, Pear and Plum crops are almost complete failures in this district. The trees blossomed well, but owing to late frosts and cold winds the fruits did not set well, and even on wall trees the crops are poor; Apricots are scarce, but Peaches are an average crop. Gooseberries, Black, Red and White Currants are all good, but Raspberries are not so fine as last year, owing to the cold winds and droughts. Strawberries were a record crop. The varieties grown are The Duke, Laxtonian, King George, Royal Sovereign, and Givon's Late Prolific. The Duke is a grand cropper, early and of good colour, but my experience of this variety is that it requires more room between the rows and plants owing to the strong growth. Two-year-old plants put two feet apart each way are touching. I intend to plant at two feet six inches each way this season to give the plants plenty of room. *W. E. Anderson, Close House Gardens, Wylam-on-Tyne.*

YORKSHIRE.—The fruit crops are, with the exception of Strawberries, Gooseberries and Red Currants, very poor. Cold winds and wet weather in early spring spoilt the blossom, and some trees on the windy side are shrivelled up as if scorched. Strawberries were a splendid crop. *Jas. E. Hathaway, Baldersby Park Gardens, Thirsk.*

ENGLAND, E.

CAMBRIDGESHIRE.—With the exception of Pears, all fruit trees were well laden with blossom, but late frosts and cold easterly winds caused much damage, Plums suffering especially. Strawberries promised well, but frost on the night of May 23 caused a great amount of damage in some districts close by, while others

Digitized by Google

escaped. Raspberries also suffered on that occasion, and the drought has practically finished the fruits that were left. *Arthur Sewell, 32, Barton Road, Ely.*

Essex.—The fruit crops generally in this district are very disappointing. There are practically no Pears. Apples of certain varieties are a fair crop. Plums, with one or two exceptions, are also a failure. Fruit trees generally bore an abundance of bloom, but the flowers failed to set in many instances, and were later attacked by caterpillars, which, together with very cold winds, is probably a great factor in the shortage of the fruit crops. Strawberries, Gooseberries and Currants were all very good. *Arthur Bullock, Copped Hall Gardens, Epping.*

—The long-continued cold thinned the stone fruits severely. The check to growth encouraged attacks of aphis, particularly on Plum trees. Apples are now suffering seriously in the same way—a fact which is bound to lessen that crop. *C. Wakely, County Gardens, Chelmsford.*

Huntingdonshire.—The season is notable in this district as the worst in memory for attacks of aphis. Cold, sunless weather retarded growth, and in spite of continued spraying the aphis gained the upper hand. Many trees in Plum orchards are denuded of their leaves, and the fruits have dropped off or have failed to swell. Cherries, Apricots and Apples are badly infested, as are also field crops of Potatos, Peas and Celery. Choice Pears flowered shyly, and there will be a thin crop of these fruits. Raspberries and Currants suffered from dryness at the roots. Our total rainfall for the past three months is under 2½ inches. Eight degrees of frost were registered on May 23, and did much damage in exposed places. Strawberries on strong land have been remarkably good, and Gooseberries were a very heavy crop, except where the flowers were damaged by frost. The Fen soil is light, overlying peat, and the high land is a strong loam over a clay subsoil, with an occasional seam of gravel. *A. V. Coombe, Ramsey Abbey Gardens.*

Lincolnshire.—Most varieties of Plums have failed. Low temperature when the trees were in bloom prevented the fruits from setting freely, whilst cold nights, accompanied by bitter winds, caused many of the fruits to drop. The same is true of Cherries, which dropped wholesale at stoning time. Apples will be an average crop. Bramley's Seedling appears to be the outstanding variety. Green and black fly have been very prevalent. All crops are three weeks later than last year. *F. J. Foster, Grimsthorpe Gardens, Bourne.*

Norfolk.—The fruit trees were covered with blossom, but it was almost entirely destroyed by frost and north-easterly winds from the sea. It is the worst season we have experienced for fruit, and Pears more particularly, during the sixteen years I have had charge of these gardens. Insects have been exceptionally troublesome. *H. Naylor, The Pleasaunce Gardens, Overstrand.*

—The Pear crop is very poor as compared with late years. Bush trees are cropping very moderately. Wall Pear trees are bearing fairly well. Such sorts as Charles Ernest, Beurré Superfin, Beurré Rance and Williams' Bon Chrétien are carrying a few good fruits. Apples are far below the average in numbers. Canker and aphis have been very bad on Apple trees this season, no doubt owing to extreme variations of temperatures. Spraying proved of very little use, and the fruits of some varieties are dropping very badly. Cherries were below the average in yield, and these, too, were badly infected with Cherry aphis. Bush fruits were very good, all carrying an abundance of first-class fruit. The early fruits of Strawberries were very fine and of good flavour, but the later ones were not so good, owing to hot, dry weather. Plums are below the average as compared with last year's heavy crops. Our soil is very light and sandy, and moisture very soon dries out. *J. E. Fitt, Earlham Hall Gardens, Norwich.*

(To be continued.)

HOME CORRESPONDENCE.

Gardeners' Holidays.—I notice in the *Gardeners' Chronicle* for August 4, under Answers to Correspondence, that a gardener cannot claim a holiday unless his agreement allows it. In recent years it has come to be understood that domestic servants can claim a holiday of a week or a fortnight every year, and I think private gardeners are classed as domestic servants. I know that young men look for an annual holiday in addition to Good Friday, Christmas Day, and part of Bank Holidays. I should be glad to know what is usual. Of course gardeners would have their holidays when convenient, as they cannot always be spared. We can usually best make time for holidays in August and September. *S. H. G., Derbyshire.*

Unemployed Gardeners.—Apparently there are many gardeners who are out of employment, and I would direct their attention to some of the excellent emigration schemes of the Colonial Governments, especially Australia, which has schemes suitable for settlers, both with and without means. I am convinced that the gardener who has the prospect of eventually farming his own land in Australia will be far better off than he could ever hope to be even in a good post at home. There are frequently good openings for gardeners in their own profession in the United States. There are 670 people to the square mile in this country, whereas the United States has only 34, and some of our Colonies only from one to ten. It is obvious that these young countries can absorb our surplus population, and nearly all who emigrate make good land workers. *W. J. Farmer.*

Summer Frosts at Tichborne Park.—It may be interesting to your readers to know that on June 28th we registered 7° of frost here and 3° on July 2. On July 19, during the heat wave, we had 1° of frost; on July 28, 1°; on August 3 the temperature dropped to freezing point, and on August 4 there was 2° of frost, when Vegetable Marrows were severely cut and blackened. I wonder if any other reader in the south has such a record of frost following very hot days. Ours is a very low-lying garden abounding with streams. I have enclosed a Marrow leaf to show the effects of the frost on August 4. *C. Goodchild, Tichborne Park Gardens, near Alresford, Hampshire.*

Appearance of White Clover after Drought.—During the latter part of June and early July large areas of Chorley Wood Common were absolutely white with Clover bloom. There have been tiny scattered bits of White Clover in other years, but the quantity was negligible. Why the Clover should be in such large masses this season is a matter of some mystery. It may be that the abnormally dry season of 1921, when Chorley Wood Common was not only baked up but partly burnt over, may have had a great deal to do with the present wonderful growth of wild White Clover. *Geo. W. Stacey, Chorleywood Cedars Gardens, Herts.*

Pelargonium Rollison's Unique.—I was pleased to read Mr. Lynch's reference to this handsome old plant (see p. 84), and to know its value as an ornamental subject has not been wholly lost sight of. There is a danger in these times, when great improvements are being made amongst varieties, and introductions of new plants are common, of some really good old plants being lost to cultivation, and it is desirable that in some gardens—such as that at Aldenham, in the case of the scented Pelargonium—unique collections should be preserved. Regarding Mr. Irwin Lynch's reference to the value of Pelargonium Rollison's Unique, as a conservatory pillar plant, I well recollect that upwards of fifty years ago, in an old conservatory at Knole, Sevenoaks (which was chiefly filled with planted-out large specimens of old subjects, most of which, except in botanical gardens, are now seldom met with), a grand plant of this old Pelargonium clothed a large space on an end wall, and was a beautiful feature when in blossom. *Thos. Coomber, V.M.H., Broadstairs*

SOCIETIES.

SHROPSHIRE HORTICULTURAL.

August 15 and 16.—The annual horticultural exhibition and fête, arranged by the Shropshire Horticultural Society, was held on the above dates in the beautiful Quarry Park, Shrewsbury. The Quarry was looking at its best, the trees green and affording ample shade, the Dell bright with flowers and foliage, the Severn flowing easily along the lower frontage, and giving that cool effect which only water can produce. The weather on the opening day was gloriously fine, and as a result of the rain which fell the previous afternoon, the atmosphere was pleasant.

The exhibition was extensive, and in many respects well up to pre-war standards; for the most part it was housed in one great canvas-covered area, two other tents accommodating the vegetables and cottagers' exhibits respectively. The large group classes were splendid, and with the big exhibits of hardy flowers, Roses and Carnations provided a gorgeous display. The fruit classes showed some improvement upon other post-war shows, but the exhibits therein were not up to old-time quality.

The attendance on the opening day seemed to be as large as ever. The arrangements made by Mr. Brazier, the secretary, and his committee were excellent; judging commenced promptly at 9 a.m., and although 11.30 was the time arranged for the admission of subscribers they were admitted about twenty minutes earlier.

We suggest that for another season the Shrewsbury Society should make an endeavour to co-ordinate the exhibits with a view to an improvement in the general effect of the show.

Groups.

In the great class for a group of flowering and foliage plants arranged on a space of 300 sq feet, there were four competitors, and these, together, provided one of the great attractions of the show. The premier award of £45 was won by Mr. Jas. Cypher and Sons, Cheltenham, with a particularly beautiful and graceful exhibit. For once in a way the arched background was omitted, and in its place a grand Kentia was used, set amid orange-coloured Fuchsias. Humea elegans disposed in several parts of the group lent an airy gracefulness to the whole, and this light effect was assisted by long arching spikes of Francoa ramosa, Oncidium incurvum, Lilium speciosum and L. s. album lent pleasing colour while throughout the groundwork of the group, and in association with brilliant Codiaeums, Nandina domestica, and Rex Begonias, were beautiful Cattleyas, Epidendrums and Ixoras, and quaint Cypripediums; the whole effect was exquisite, and we have rarely seen a finer effort, even by the Cheltenham artists.

Mr. W. A. Holmes, Chesterfield, won second prize with an excellent group in which Liliums, Miltonias, Odontoglossums, Francoa and Clerodendron fallax were the chief flowering plants; 3rd, Sir G. H. Kenrick, Edgbaston (gr., Mr. J. L. Macdonald), with a pleasing display, in which Orchids were used freely.

There were also four competitors in the scarcely less attractive class for a group of foliage plants arranged for effect on an area of 250 square feet. Messrs. J. Cypher and Sons were again successful in securing the first prize, and they made good use of bright Codiaeums, Nandina domestica, Aralias, Phyllanthus, Palms, Dracaenas, Anthuriums, Rex Begonias, Fittonias, Hibiscus Cooperi and Asparagus. Second prize was won by Sir G. H. Kenrick; 3rd, Mr. W. A. Holmes.

These eight groups alone provided an exhibition worth travelling a long way to see.

Sir John Leigh's group of Codiaeums, Malmaison Carnations, Francoa ramosa and Odontoglossums was adjudged the best collection in the county class; 2nd, A. M. Barber, Esq., Wellington (gr. Mr. T. A. Bremmer); 3rd, Mr. H. Howells, Shrewsbury.

Digitized by Google

Plants.

Messrs. J. Cypher and Sons led in the class for fifteen stove and greenhouse plants; their leading subjects were Pandanus Veitchii, Ixora Williamsii, I. Pilgrimii, Clerodendron Thomsonae, Acalypha hispida and Bougainvillea Sanderiana; 2nd, Sir John Leigh, Lillishall Hall (gr. Mr. T. Young); 3rd, Messrs. R. Manning, Dudley.

In local plant classes Mr. C. Hatton, Mr. H. Howells, Mr. H. Clifft, and Mr. T. Hammonds were the most successful competitors; Mr. Howells showed some good, trained, pyramidal Fuchsias.

Hardy Flowers.

The class provided for a collection of herbaceous plants, flowers and foliage arranged in a natural manner on a ground space of 250 square feet proved a great attraction, as no fewer than five competitors entered, and together produced a display of colour and floral beauty rarely seen before at any exhibition.

The first prize and the President's Cup were awarded to Messrs. Gunn and Sons, Olton, for a bold and well arranged exhibit in which the flowers were of fine quality, the arrangement as natural as could be expected under the circumstances, and the finish excellent. Prominent subjects were Kniphofia aloides, Gladioli in variety, Phloxes, Lilium Henryi, Alstroemerias, Thalictrum dipterocarpum, Hollyhocks, and Gaillardias.

Messrs. Bees, Ltd., Chester, were awarded the second prize for a group in which grand Hollyhocks provided an effective background, for Gladioli, Scabious, Astilbes, Lilium Sargentae, Phloxes, Heleniums, etc.; a fine display but lacking in marginal finish; 3rd, Messrs. Prichard and Sons, Christchurch; 4th, Messrs. Harkness and Son, Bedale.

In the class for eighteen bunches of hardy flowers Messrs. Bees won the first prize; 2nd, Messrs. M. Prichard and Sons; 3rd, Mr. A. S. Dunton; but this class was a weak one, and suffered by comparison with the larger one.

Messrs. Prichard and Sons, Christchurch, exhibited the finest lot of Lilies and other bulbous plants in flower and made up a most effective group with Lilium tigrinum, L. speciosum album, Crinum Powellii and C. P. album, Galtonia candicans and Montbretias in variety; 2nd, Messrs. Harkness and Sons.

Florists' Flowers.

Mr. C. Engelmann, Saffron Walden, won first prize in the class for perpetual Carnations displayed on a space 18 ft. by 4 ft. To the cash award was added a Silver Challenge Cup presented by the late Annabelle Lady Boughey, a former President of the Society. There were two competitors and each had a very sharply pitched, high exhibit—a veritable wall of flowers. Mr. Engelmann had a fine arrangement of grand blooms, some of his outstanding varieties being Circe, Renown, Laddie, Tarzan, Saffron, and White Pearl. Second prize was awarded to Mr. Chas. Wall, Bath, for a fine effort wherein the varieties Marion Wilson, Mrs. C. W. Ward, White Pearl, and Red Ensign were particularly effective.

In another class for a group of Carnations Mr. H. Woolman, Birmingham, gained the chief award.

Messrs. Blackmore and Langdon, Bath, were easily the first prize winners in the class for a group of Begonias, winning with a glorious display of grandly grown plants of superb varieties—Hilda Langdon, Chrystabel Spry, Lord Lambourne, Albatross, and Mrs. J. S. Brunton were a few especially fine varieties; 2nd, Mr. H. Woolman.

Messrs. R. Bolton and Son, Halstead, had the best display of Sweet Peas, and once again used their gilded baskets for the display of clean, handsome flowers of Picture, Wonderful, Matchless, Faerie Queen, Hebe, Glorious and R. F. Felton: 2nd, Mr. A. S. Dunton; 3rd, Mr. F. R. Minshall, Market Drayton; 4th, Mr. W. Scott, Styal, Cheshire.

Mrs. C. M. Weaver, Mold, led in the class for a dozen bunches of Sweet Peas, distinct varieties, with grand flowers of Tangerine, Elegance, Salmon Queen, Matchless, Picture, Edna May, Cecily, Royal Scot, King Manoel, George Shawyer, Charity and Austin Frederick; 2nd, Mr. A. Leigh, Tittensor; 3rd, A. Bradbury, Esq., Llandudno. Mr. S. Robinson, Kingston, was the most successful competitor in the class for six varieties.

The Silver Challenge Rose Bowl presented by W. G. Phillips, Esq., for the best collection of cut Roses arranged on a space 20 ft. by 4 ft. was won by Messrs. Gunn and Sons, Olton, with a grand display that attracted a great deal of attention. The general arrangement of tall pillars of bloom, arches and baskets and stands of flowers, was excellent, but the blooms were in some instances placed too closely together. Leading varieties in this brilliant exhibit were George Dickson, Golden Emblem, Los Angeles, Mdme. E. Herriot, Souv. de Claude Pernet, Ophelia, Gorgeous, Independence Day, Miss Willmott, and The Queen Alexandra. Second prize was awarded to Messrs. Bees, Ltd., who had a fine group in which Mdme. Butterfly, K. of K., Duchess of Wellington, and Ariel were conspicuous varieties; 3rd, Mr. A. S. Dunton.

Messrs. Gunn and Sons showed the best set of eighteen vases of Roses, and were also successful in the class for three baskets of Roses, with good blooms of Sunstar, Los Angeles, and Mrs. M. Morse.

Mr. H. Clarke, Taunton, showed a fine collection of Cactus, decorative, Pompon, Paeony-flowered and collerette Dahlias, and arranged them in pleasing fashion in association with sprays of the double Gypsophila paniculata and Humea elegans; he was awarded a first prize for his group; 2nd, Mr. H. Woolman, Shirley, Birmingham; 3rd, Messrs. W. Treseder, Ltd., Cardiff.

Floral Arrangements.

In the ladies' class for a table decoration of Roses only, Mrs. John Nixon, Alderley Edge, won first prize with brilliant flowers arranged in small dark brown wicker baskets; a very pleasing effort; 2nd, Mrs. Rope, Shrewsbury, with a bolder arrangement of Mdme. Butterfly; 3rd, Miss Newsham, Ormskirk.

In another class, Roses excluded, Mrs. Rope was awarded the chief prize for a pretty arrangement of Orchids, Gloriosas, and Francoa associated with Codiaeum and Caladium argyrites leaves; 2nd, Mrs. John Nixon; 3rd, Miss Newsham.

Mr. M. Stather, Cottingham, Hull, showed the best basket of flowers—a charming arrangement of Odontiodas, Oncidiums and Laelio-Cattleyas; 2nd, Mrs. J. Nixon. Miss Newsham had the best bowl of flowers—Independence Day Roses, finely displayed.

Mr. A. Adshead, Gatley, exhibited the best of two bridesmaid's and bride's bouquets; he used Orchids successfully, and in the bride's bouquet he associated Cypripedium callosum Sanderae with white Cattleyas and Lily of the Valley; 2nd, Mr. C. Vickers. Mr. Stather showed the best hand bouquet, a gorgeous design in Odontiodas and Cattleyas.

Rock Gardens.

Messrs. T. R. Hayes and Son, Keswick, won the chief honours for a rock and water garden, with a very natural design in which an effort had been made to create gay or striking effects. The little water-fall and streamlet, the grey, weathered stone and the colonies of Gentians, dwarf Campanulas, Heathers, St. Dabeoc's Heath, Junipers and Primulas all harmonised in the most natural fashion, and the whole was greatly admired for its quiet colouring and general restraint. Mr. P. Gardner, Ilkley, gained second prize; he introduced grassy slopes below the rock and contrived a bog garden with Astilbes.

Dessert Fruit.

Three competitors came forward in the class for a decorated table of choice fruits. Thirty dishes of fruit in not fewer than nine distinct kinds were required, and the first prize was the Shrewsbury Tradesmen's Cup and £25. This fine prize was won by the Duke of Newcastle, Worksop (gr. Mr. S. Barker), who led with 204 out of a possible 242 points. He exhibited Madresfield Court, Mrs. Pearson, Muscat of Alexandria and Muscat Hamburgh Grapes; Early Rivers, Pineapple, Pitmaston Orange (grand), and Humboldt Nectarines; Crimson Galande and Peregrine Peaches; Kirke's and Jefferson Plums; Brown Turkey and one other dish of Figs; Triomphe de Vienna and Dr. Jules Guyot Pears; James Grieve and Lady Sudeley Apples; and four fine Melons. Mr. Barker used Francoa ramosa and Baroness de Brienen Carnations as decoration.

The second prize was awarded to Sir John Leigh, who had excellent Sea Eagle Peaches, good Muscat of Alexandria and Chasselas Napoleon Grapes, and capital Plums; 182 points. The third prize was won by Mrs. T. S. Hall, Crickett St. Thomas (gr. Mr. G. F. Richardson), who had 161 points.

It is our opinion that the committee of the Shrewsbury Society would be well advised to give the decorated fruit table class its earnest consideration with a view to making it more attractive to competitors and visitors to the show. At present the thirty dishes of fruit are over-crowded and not less than 50 per cent. additional space should be allotted to each competitor. Exhibitors should pay more attention to careful and legible labelling and to further increase the educational value of the class the exhibits should be placed end to end, instead of side by side. This year, so soon as the protecting wires were put up, it was impossible to see the fruits on the inner sides of two of the tables. Placed end to end it would be possible for every visitor to see every fruit in every dish.

The class for a dozen dishes of dessert fruits brought out an excellent competition and some excellent fruits. J. Brennand, Esq., won the first prize, showing heavy bunches of Madresfield Court and Muscat of Alexandria Grapes, Fondante d'Automne Pears; Newton and Dryden Nectarines, Czar and Ouillin's Golden Gage Plums, Bigarreau Napoleon Cherries, Brown Turkey Figs, Stirling Castle Peaches, and Hero of Lockinge Melon; 2nd, Messrs. J. Webber and Sons, Minehead. Each of the collections was pleasingly decorated with flowers.

The best collection of nine dishes of fruit was shown by Col. Heywood Lonsdale, whose best examples were of Violette Hative Peaches, Clapp's Favourite Pears, and Melons; 2nd, Capt. W. W. Hayes, Harcourt (gr., Mr. T. Meadock).

Col. T. Dickin had the best dish of Peaches among eight competitors; J. Brennand, Esq., led for Nectarines, showing Dryden; unfortunately numerous exhibitors did not name their varieties. Col. Heywood Lonsdale, Sherington Hall (gr., Mr. J. Mills) showing the best Apricots; J. Brennand, Esq., the best Gages (Ouillin's Golden Gage); and the Duke of Newcastle the best Plums (Jefferson).

Great Grape Class.

Some of the excitement formerly attaching to the competition in the class for a dozen bunches of Grapes appears to have disappeared, nevertheless, there were four competitors on this occasion, and, on the whole, the Grapes were of fine quality. As usual the bunches were staged on separate stands, and floral decoration of the exhibits was allowed.

The first prize of £20 was won by the Duke of Newcastle, Clumber, who showed an even set of medium-sized bunches, and secured 78 out of a possible 118 points. We give the varieties, but as the bunches were not numbered on this occasion, it would serve no useful purpose to attempt to give possible and awarded points for the individual bunches. Moreover, on the pointing card, no maximum "possible" was over 10 points, whereas in the schedule 11 was suggested as a maximum for Muscat of Alexandria: 10 for all other Muscats and Black Hamburgh, and 9 for all other Grapes! The Clumber varieties were Mrs. Pearson (2 bunches), Madresfield Court (4), Muscat of Alexandria (4), and Black Hamburgh (2). Second prize was won by Messrs. J. Webber and Sons, who had 72 out of a possible 116 points; Black Hamburgh clusters of large size were shown by these exhibitors; 3rd, the Pwllycrochan Hotel Co., Colwyn Bay, with 68 out of a possible 116 points; the bunches were very shapely, but needed a little more time to colour properly;

Digitized by Google

4th, J. Roger Corbett, Esq., Ynysymaengwyn (gr., Mr. J. Jones), with 67½ points out of a possible 118, his Black Hamburgh Grapes had very large berries.

Grapes.

The best four bunches of Grapes were medium sized, well coloured clusters of Black Hamburgh and Muscat of Alexandria, shown by the Earl of Coventry, Croome Court, Worcester (gr., Mr. W. H. Nelson); 2nd, Lt.-Col. H. C. Legh, Knutsford (gr. Mr. A. J. Cook), with large even bunches of Madresfield Court and Muscat of Alexandria; 3rd, J. Brennand, Esq., Baldersby Park, Thirsk (gr., Mr. J. Hathaway), with similar varieties.

The Earl of Coventry also showed the best pair of bunches of Black Hamburgh Grapes, with well-coloured berries; 2nd, the Duke of Newcastle; 3rd, Lady Mary Herbert, Styche (gr., Mr. John Birch); ten entries.

In the class for a pair of bunches of Madresfield Court, J. Brennand, Esq., led with very heavy bunches; 2nd, the Duke of Newcastle. The Earl of Coventry won first prize for a bunch of Black Hamburgh, in close competition; 2nd, the Duke of Newcastle. For any other black Grape the Duke of Newcastle led with Muscat Hamburgh.

Lt.-Col. Legh led in the class for two bunches of Muscat of Alexandria Grapes, with medium-sized but finely-coloured bunches; 2nd, the Earl of Coventry; 3rd, Col. Mellor, Abergele (gr., Mr. C. Price). For any other white Grape the awards were made in favour of Messrs. J. Webber and Sons, Minehead, and the Duke of Newcastle, for Buckland's Sweetwater and Mrs. Pearson respectively.

In the local classes Lady Mary Herbert gained first prize for Black Hamburgh Grapes, and Capt. Bibby, Sansaw (gr., Mr. J. Clark), for Muscat Grapes.

Vegetables.

Remembering the long spell of dry weather and the recent brilliant sunshine experienced in the south, it was a pleasure to find vegetables so finely and extensively shown at Shrewsbury.

The first prize offered by Messrs. Sydenham for nine kinds of vegetables was won by Mr. W. Robinson, Garstang; 2nd Mr. E. Millington, Hadnall. Mr. A. Watson, Stourbridge, led in Messrs. Webb's class for nine kinds, with Mr. W. J. Jones, Ammanford, second. Messrs. Carter and Co.'s premier prize was won by Mr. W. Taylor, who had a very fine collection. Mr. C. J. Gwyer, Titley, led in the class provided by Messrs. Clibrans, for nine kinds of vegetables. Mr. T. M. Jones, Llandilo, annexed the premier award in a class provided by Messrs. Dickson and Robinson; 2nd, Mr. D. Thomas, in a fine competition. The prizes offered by Messrs. Sutton and Sons were well contested, and the first and second awards were won by Viscount Hambledon, Henley-on-Thames, and Mr. W. J. Jones, respectively, each showing fine produce.

Viscount Hambledon was also successful in the open class for twelve kinds of vegetables with a fine display, in which Celery, Potatos, Tomatos, Parsnips, Onions, Cucumbers, Beet, Carrots, Leeks and Cauliflowers were especially good; 2nd, Mr. W. J. Jones, Ammanford. Col. Heywood led in the Shropshire County Class for nine kinds of vegetables.

There was excellent competition in the single-dish classes, and some splendid specimens of Onions, Parsnips, Turnips, Carrots and Potatos were staged.

Non-Competitive Exhibits.

The trade and other non-competitive exhibits were especially good on this occasion, and a special word of praise is due to the King's Acre Nurseries for their grand lot of fruit trees in pots; to Messrs. Dickson and Robinson for a brilliant exhibit of flowers and vegetables, and to Messrs. Bakers for their large rock and water garden.

The following are the medals awarded:

Large Gold Medal.—To the King's Acre Nurseries, Hereford, for fruit trees in pots; to Messrs. Dickson and Robinson, Manchester, for flowers and vegetables; to Mr. H. J. Jones, Lewisham, for Phloxes; to Messrs. Bakers, Wolverhampton, for rock and water garden; to Major A. Pam, Wormely Bury, Broxbourne (gr., Mr. F. Streeter), for a magnificent collection of vegetables, finely grown and finely displayed; and to Messrs. Webb and Sons, Stourbridge, for vegetables and flowers.

Gold Medal.—To Mr. Henry Eckford, Wem, for Sweet Peas; to Mr. H. N. Ellison, West Bromwich, for Ferns; to Messrs. Forbes, Hawick, for Phloxes and Pentstemons; to Messrs. Isaac House and Son, Bristol, for new Scabious; to Mr. W. Wells, junr., Merstham, for hardy flowers; to Mr. E. Murrell, Shrewsbury, for Roses; to Messrs. Herd Brothers, Penryn, for Sweet Peas; to Mr. E. J. Bayley, Shrewsbury, for Lilies and vegetables; to Messrs. Toogood and Sons, Southampton, for vegetables and flowers; to Messrs. J. Peed and Son, Norwood, for Hydrangeas and Streptocarpuses; to Messrs. Jarman and Co., Chard, for Dahlias, etc.; to Mr. R. Felton, Hanover Square, London, for charming floral designs; to Mr. C. Vickers, Leicester, for a fine display of floral art; to Messrs. Jas. Carter and Co., Raynes Park, for a fine lot of vegetables and flowers; and to Messrs. M. Prichard and Sons, for hardy flowers.

Silver Medal.—To Messrs. Blackmore and Langdon, Bath, for Delphiniums; to Mr. E. Parsons, Worcester, for fruits; to Messrs. Bowell and Skarratt, for Alpines; to Mrs. Thomson, Handsworth, for Cacti; to Messrs. Clarke, Taunton, for Larkspurs; to Messrs. Hewitt, Solihull, for Gladioli; to Messrs. E. F. Fairbairn Bros., Carlisle, for Phloxes and Dahlias; to Messrs. Knight and Son, Wolverhampton, for Roses; to Mr. R. Lawrie, Carnforth, for Begonias; to Messrs. Vert and Sons, Saffron Walden, for Hollyhocks; to Messrs. Stuart Low and Co., Enfield, for Orchids and Carnations; to Mr. Bunn, for Pelargoniums; to Messrs. Sanders, St. Albans, for Orchids; and to Messrs. H. Simpson and Sons, Birmingham, for Antirrhinums.

Obituary.

Mr. George Wyllie.—His many friends throughout Scotland and farther afield will learn with deep regret of the death of Mr. George Wyllie, J.P., which occurred at Inverness, whence he had retired in May, 1920. Born near Stonehaven, Kincardineshire, 80 years ago, Mr. Wyllie commenced his career as a forester at Cullen House, the chief Scottish seat of the Earls of Seafield, and he was also in the service of the Earl of Hopetown, and of Mr. Baird, of Strichen House, Aberdeenshire. But it was on the Ballogie estates, in the Dee Valley, Aberdeenshire, where Mr. Wyllie's life work was done. There for nearly half a century he served under three generations of proprietors, the Nicols of Ballogie. Forestry experts from distant parts have warmly acknowledged the sound ideas and fine progressive lines on which the forestry work was done at Ballogie. When he retired in May, 1920, Mr. Wyllie was made the recipient of handsome tokens of esteem from the tenantry, employees, servants and friends, and at the presentations, warm tributes were paid to the zealous and faithful services rendered by him, and to the fine consideration he had always shown to those around him. Mr. Wyllie was a Justice of the Peace for Aberdeenshire; he was predeceased by his wife, and retired to live in Inverness with his son, Mr. William R. Wyllie, of the Scottish Board of Agriculture. The funeral, which was largely attended, took place at Birse Churchyard, Ballogie, on Wednesday, August 8.

Siegfried Braun.—The death took place on July 14 of Siegfried Braun, the organising secretary of the Deutschen Gartenbau-Gesellschaft. He had held office in the Society for 26 years, and his whole interests were centred in it. His death was the result of his falling heavily from a ladder in the library belonging to the Society, in the horticultural training school in Berlin. He was found some hours afterwards, unconscious, by a postman who happened to enter the library, and was then past help. It is especially tragic that he should have died just at this time, as some negotiations with the State authorities, which would have had the effect of placing the Society on a sound financial basis, had just taken a favourable turn. Herr Braun was only fifty-eight years of age, and previous to his sad accident was in full health and vigour.

Mrs. Findlay-Hamilton.—By the death, on August 4, of Mrs. G. J. Findlay-Hamilton, wife of G. D. Findlay-Hamilton, Esq., of Carnell, Ayrshire, horticulture has lost one of its most devoted adherents. Mrs. Findlay-Hamilton was no mere amateur who left the care and oversight of her garden to others, but was herself the moving spirit of one of the prettiest and most interesting of the larger gardens of Ayrshire. She took a warm interest in all the phases of gardening, specially in rock plants and hardy border flowers. For the former she constructed a magnificent rock garden in perfect taste and admirably arranged for the welfare of a very fine collection of good plants, among which she delighted to work. It may be added that most of the stones were placed by Mrs. Findlay-Hamilton's own hands. She was a lady of great ability, and during the war, and at other times, devoted much time to philanthropic and other public work. Much sympathy is felt for Mr. Findlay-Hamilton, and for their only daughter, Mrs. Buchanan-Findlay. Their only son, Lieut. John E. Hamilton, was killed during the war at the age of 19.

ANSWERS TO CORRESPONDENTS.

Abutilon and Vine Leaves Damaged: *L. G. W.* The leaves of the Abutilon and also those of the vine show ample evidences of scorching and thrips; green fly and some scale were found on the vine leaves. More care in cleanliness and in the ventilation of the house is desirable.

Assessment of Rent Allowance for Income Tax: *J. W.* Your best course would be to report the matter to your employers, and ask them to take it up direct with the authorities on your behalf.

Asters Diseased: *J. H. W.* The rotting at the base of the Aster stems is due to the presence of a fungus (Phytopthora species), which produces a disease known as Black Neck or Wilt. Lift and burn all diseased plants, and spray the healthy ones with Bordeaux mixture.

Correction.—We are informed that the first prize in two classes for twelve varieties of Sweet Peas at the Royal Lancashire Show on August 2 were won by A. Bradbury, Esq., Bryn-Lupus, Llandudno (gr. Mr. H. G. Shaw), and not by Mr. A. Bolton, and Messrs. R. Bolton and Sons, as stated on page 93.

Excessive Growth on Fruit Trees: *D. S.* The absence of fruit has no doubt encouraged your tree to make more growth than usual; but if you carefully thin out a large number of the shoots, and summer prune the others, this should go far to induce fruitfulness for another year.

Flowers for Christmas: *A. S.* In addition to Chrysanthemums, you could cultivate Roman Hyacinths, the earliest flowering Daffodils, Paper White Narcissi, Lily-of-the-Valley, Carnations, Poinsettias, and Freesias.

Gooseberry Bushes Dying: *R. P.* Your Gooseberry bushes are suffering from a severe attack of the "die back" disease, caused by a species of Botrytis. The Ministry of Agriculture publishes an illustrated leaflet dealing with this disease, and a copy may be obtained, post free, on application to the Ministry, 5, Whitehall Place, S.W.

Melon Leaves Blotched: *G. B. B.* The blotching and yellowing of the Melon leaves are due to scorching, which is caused by failure to ventilate the house sufficiently early on bright days.

Names of Plants: *H. S.* The flowering plant is Escallonia macrantha and the shrub Tamarix gallica. *L. G. W.* Plant in flower, Asclepia curassavica; stove plant, possibly

Digitized by Google

Eranthemum versicolor; send when in flower. *G. D., Antrim.* 1, Lilium sp.; 2, Campanula rapunculoides; 3, Sempervivum sp. cannot name without rosettes of leaves; 4, Lysimachia Nummularia; 5, Anaphalis margaritacea; 6, Veronica orientalis; 7, Sedum album; 8, Veronica Lyallii; 9, Helianthemum vulgare. var. cupreum; 10, Campanula garganica.

Rose Failing to Open: *Mrs. T.* We do not recognise the variety of Rose. The failure of the blooms to open is probably due to the earlier cold, sunless weather.

Snail Plant: *Feltham.* The plant commonly known as "Snails" is Medicago scutellata; the Snail Flower is Phaselous Caracalla. We do not know if the term Snail Plant is used for either of these plants in Australia.

Soil for Analysis: *S. H.* We do not undertake to analyse soil for our readers. Send to the R.H.S. Gardens, Wisley, Ripley, Surrey.

Tomato Fruits Diseased: *A. W.* The Tomato fruits were more or less covered with the grey mould of Botrytis cinerea, but we believe this is the result rather than the cause of the decaying portions. See that a drier atmosphere is maintained, and that little or no overhead watering is given. Also collect and burn all dead and decaying leaves and fruits.

Tomatos Failing to Swell: *J. E. L.* No disease could be found in the fruits or leaves, therefore we can only conclude that the failure of the fruits to swell properly is due to some cultural error, possibly to a severe check or the poor condition of the soil.

Violas Diseased: *W. H. K.* The Violas are suffering from a very bad attack of mildew caused in some measure by the extremely dry weather of the past weeks. Spraying with potassium sulphide would doubtless assist in checking the disease; but it would appear that the trouble has gone too far, and your best plan would be to propagate from clean, young stock.

THE WEATHER.

THE WEATHER FOR JULY.

The mean direction of the wind at Southport in July is normally a point or two on the northerly side of west; but this season it was a point or so south of west, and also stronger than usual. The month was therefore more cloudy and humid than is customary, and considerably warmer. Very hot weather was restricted to a single day—the 6th—when the maximum thermometer registered 86.2°, and even 80° was not again reached; but every day from the 6th to the 14th was very warm, and a few days and several nights later also. The mean temperature of the complete month was 62.1°, or 2.8° above the fifty years' average. Nevertheless, only 161 hours of bright sunshine were experienced, implying a deficiency of no fewer than 44 hours. The total rainfall was almost exactly equal to the normal—3 inches—but at Birkdale nearly 3½ inches fell. The latter half of the month was principally stormy and unsettled, and on the 26th the wind attained gale force. Slight thunderstorms occurred on the 7th and 30th. *Joseph Baxendell, The Fernley Observatory, Southport.*

THE WEATHER IN SCOTLAND.

The mean temperature for July was fully one and a half degrees above the normal, but there were cold spells in the month, notably on the 26th. Rainfall was slightly deficient, being 2.53 inches for 15 days, of which nearly one-half fell on the last two days. On the whole the month was a dull one with an aggregate of 150.1 hours of sunshine; this gives a daily average of 4.84 hours and a percentage of 29; there were only three sunless days. The barometer, with a mean of 29.90 inches, varied from a highest of 30.26 inches on the 13th to a lowest of 29.26 inches on the 31st. With a mean maximum of 68°, and a mean minimum of 52°, the mean temperature works out at 60°, against a normal mean of 58.4°. The highest maximum was 81° on the 12th—a rather exceptional temperature—and the lowest minimum 47° on the 18th; there were 12 days on which the temperature reached or exceeded 70°. On the grass, the mean minimum was 49°, with a lowest of 43° on the 13th; there were no nights of ground frost. At 1 ft. deep the soil temperature rose from 57° to 63°, and fell again to 57°. We had thunderstorms during the month, one on the 7th and the other on the 30th, the latter being accompanied by exceptionally heavy rain. The prevailing winds were from the south and west. *John Davidson, Director of Studies, St. Andrews Provincial Committee, Training College Gardens, Mayfield, Dundee.*

MARKETS.

COVENT GARDEN, Tuesday, August 14, 1923.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Eds.

Remarks.—Fairly brisk conditions have ruled during the past week, all sections of fruits clearing satisfactorily almost each day. English Apples of first-grade quality are in fair demand, and all available supplies have readily been taken up. A fair sprinkling of Czar Plums are selling at moderately good prices, considering the quantities of Spanish and French Plums and Greengages that are arriving. Plentiful supplies of French Pears are on offer and meeting a good demand. Choice fruits, such as Grapes, Peaches, Nectarines and Figs are quoted lower. Melons meet a slow trade. Both English and Dutch Tomatos are now more plentiful, and prices are accordingly at a lower level. Cucumbers meet a fairly steady trade. Supplies of Beans are rather short and below requirements. Green vegetables are in fair demand, but the Potato trade is quiet.

Remarks.—In this department there appears to have been no shortage during the past week. A sudden drop in prices for Lilium longiflorum was greatly welcomed, and the flowers are now arriving in good condition. L. speciosum has hardened in price, owing to a short supply. Other subjects show little change from last week. Carnations and Roses are greatly affected by the hot weather, and only the best blooms of the former are suitable for another journey. Roses are arriving in large quantities, and the majority come in an open condition, and they are, therefore, practicably unsaleable. These are offered to the street vendors at a very low figure. Other choice subjects consist of Gardenias, Stephanotis, Lapagerias and Lily-of-the-Valley. Chrysanthemums are gradually increasing, Sanctity being the most popular sort at present. A few blooms of Countess (white) and Mercedes (yellow) are offered, but these are of only medium quality. A few branches of spray bronze flowers find a ready sale. Asters, although more plentiful, both white and coloured, remain firm in price; a few single varieties are now on sale. There is a glut of Statice sinuata, white Daisies, Gypsophila, Coreopsis and Gaillardias. Large-flowered Gladioli are fairly plentiful. A good supply of these blooms is being sent from Holland.

GARDENING APPOINTMENTS.

Mr. A. E. Yallop, for the past three years Foreman at Kingston Hall, Derby, and previously at the Royal Gardens, Sandringham, as Gardener to Captain Drury-Lowe, Locko Park, Spondon, Derby.

Mr. Alfred W. Phelps, for the past two and a half years Foreman to Sir Hugh Thomas, O.B.E., Castle Hall, Milford Haven, Pembroke, and previously at Norman Court, Salisbury, Duffryn, nr. Cardiff, and Frensham Hill, Surrey, as Gardener to W. H. Brady, Esq., Glan-y-Coed, Penmaenmawr, North Wales. (Thanks for 2s. for R.G.O.F. Box. Eds.)

Mr. James A Paice, for the past nine years Gardener to the Rev. Edgar Stogdon, M.A., Aldenham Vicarage, Watford, Hertfordshire, as Gardener to Charles E. Gabain, Esq., "Sunnyfields," Mill Hill, Middlesex.

Mr. B. H. Cole, for the past two and a half years Gardener to Lt.-Col. G. H. Siobart, D.S.O., Harperley Park, Co. Durham, as Gardener to the Right Hon. Lord Barnard, Raby Castle, Staindrop, Darlington. (Thanks for 2s. 6d. for R.G.O.F. Box.—Eds.)

Mr. F. W. Dale, for the past ten months Gardener to Mr. Graham, Barford House, Warwick, and previously for eight years Gardener to G. F. Moore, Esq., Chardwar, Bourton-on-the-Water, Gloucestershire, as Gardener to J. E. Hall, Esq., The Grange, Leamington Spa.

The Ormskirk Potato Trials, 1923.

The public inspection of the trials of Potatos for immunity against wart disease took place on Thursday, August 16, at the Potato Testing Station at Ormskirk, where the National Institute of Botany is carrying on the work begun by the Ministry of Agriculture. A good number of interested people attended, although the attendance was less than in the earlier days of the trials. This is no doubt partly due to the fact that the immunity of certain varieties is now established; partly, also, because some of those whose faces were familiar at these meetings have other opportunities of seeing the varieties under trial, and partly because the Scottish Board of Agriculture has established somewhat similar tests near Edinburgh. The demonstration of the tests was undertaken by Mr. H. Bryan, the Superintendent of the Potato Trials, and it was followed by a lunch at which Sir Lawrence Weaver presided, and spoke. The tests themselves occupy 361 plots; in addition there are nearly 500 small plots of seedlings undergoing a preliminary test, and a collection of 105 varieties which serve as comparisons for the varieties under test, and are a living museum of commercial and historical varieties. This collection is of great assistance to the Inspectors of the Ministry, who have to be trained to recognise the characteristics of the commercial varieties before they can be entrusted with the important work of inspection with a view to the certification of seed Potatos as true to name. Near by a number of varieties entered in competition for the Gold Medal which is awarded by the Ormskirk Potato Society are being grown, and many of them look extremely well. It is not, however, to be forgotten that the chief reason—in fact the only reason—for these tests is to discover whether new or little known varieties resist attacks of wart disease; and chief interest centres around these. Of the varieties tested this year, after the elimination of old ones masquerading under new names (and, perhaps, British Queen, Up-to-Date and Arran Chief appear most often among these) a good many new seedlings are left. About 40 of these have been grown twice before at Ormskirk, and have had no wart, and another twenty-five or so came unscathed through the ordeal last year. It is too early yet to say whether they are again free, and too early to know whether many of the newcomers will escape, but a few of the last group show the trouble, which is late in making its appearance this year. One of these is extremely interesting, for, except that it is subject to wart disease, it is practically identical with Flourball. It is to be hoped that the owner of this stock will destroy it entirely forthwith, for it would be extremely difficult to eliminate from Flourball if once the stocks were mixed. Among the new varieties there are many which are extremely like one another, and while it is fairly easy to distinguish between most of the varieties in commerce, the tests now in progress give the lie to the frequent statement that there is always wide divergence in the progeny raised from any particular variety. In many cases only the most careful inspection reveals differences between sister seedlings and between the seedlings and the parent; and at times no difference whatever is discernible. This is true not in one race only, but in several. Raisers of new varieties should face the fact that immunity to wart disease is only one of many characters that make a desirable Potato. Only when they combine with this immunity, characters superior to those of existing immune varieties, are they worth consideration. If raisers fairly faced this fact there would be among the varieties under test fewer coloured deep-eyed, irregular, tubers of bad quality; fewer spindly, unhappy-looking stems; fewer varieties prone to make many instead of heavy tubers. There is room for new good varieties. But a new immune early must bulk as large as Epicure, it must be of as good shape as May Queen, and it must not be subject to winter rot. A second early variety must be at least as good as Great Scot. A late sort has to compete in quality with King Edward and in general amenability with Up-to-Date. There are good varieties immune to wart disease; there may be better; but they will not be attained by the retention of obviously poor sorts, or new ones too much like existing varieties, even though they be new seedlings; and there are many such among these trials. It may not be fair to judge of a variety from what one sees at Ormskirk, for the plants are not arranged or cultivated in such a way as to bring out the best the variety is capable of—that is not the object of the trials—but so far as one can see from them there are very few new varieties in immediate prospect which will go far. One cannot speak too highly of the care bestowed upon these trials by Mr. Bryan and Miss Whitehead, who arrange, record and watch over the plants with the greatest assiduity.

The Foremarke Challenge Cup.—The Foremarke Cup for twenty spikes of named Gladioli, in not fewer than ten varieties and not more than two spikes of any one variety, will be offered for award at the Royal Horticultural Society's meeting on September 4. The winner will be required to sign a guarantee that all the flowers exhibited were grown by himself. Entries must reach the Secretary, R.H.S., Vincent Square, London, S.W.1, not later than August 29, and the flowers must be arranged by 11 a.m. on September 4.

Flowers and Fruit in Season.—A flowering spray of Ficus ficifolia, from a plant only nine years old, but which has flowered on three occasions in the past five years, has been sent us by Mr. W. Honess, from Walhampton Gardens, Hampshire. The flowers are exceedingly handsome, the showy part being the scarlet filaments of the stamens which are arranged in a dense fringe around the edge of the cup-like flower. Not the least interesting feature of the flower is the operculum or lid which is entire on the unopened buds and in various stages of displacement on those that are opening, the anthers in some cases being partially exposed as though pushing the lid off. The leaves are exceedingly handsome and not unlike those of the India-rubber plant, but smaller, although the texture is, if anything, stouter. In some the mid-rib and petiole is rose-coloured. This beautiful Eucalyptus formed the subject of a supplementary illustration in *Gard. Chron.*, November 30, 1907, from a sketch by the late Mr. Worthington G. Smith.—Mr. Smith, Daisy Hill Nursery, Newry, sends us a trailing growth of Rubus pedatus, a charming little species, which appears to root readily along the stems and should therefore be a useful plant for the rock garden. Although it flowers somewhat freely, it very rarely fruits in Great Britain and Ireland, therefore the specimen sent, carrying one of its dainty, reddish, roundish fruits, was all the more interesting.

New Use for Coconut Husks.—We learn from the *Journal of the Royal Society of Arts* that a company in the Philippines has recently begun the manufacture of paper from the husks of Coconuts, of which it is estimated that 350,000 to 400,000 tons are wasted annually. The present cost of production is high, and it will be necessary to convert the husks into pulp near the mill from which they are a by-product, in order to save expense in transportation. Even then it is questionable if the pulp can be produced at a figure that will allow it to compete with wood pulp, or other kinds of pulp now used for paper making. Other uses to which the coir fibre is put are rope making, filling mattresses, etc., and the making of corky pulp for insulation purposes.

Raspberries in Scotland.—*The Glasgow Herald* for August 18 states that prices for Raspberries at Blairgowrie are tending upwards, sales having taken place at £42 per ton, and sellers holding out for more. During the week ending August 18, 304 tons of fruit were dispatched from Blairgowrie Station, making a total for the season to date of 847½ tons, compared with 1,010 tons at the same time last year.

The Cultivation of Medicinal Herbs.—The *Journal of the Ministry of Agriculture* for August warns those who contemplate growing medicinal herbs for profit that there are abundant supplies available at the present time, and no ground for apprehending any shortage in the future. The supplies are obtained chiefly from overseas, and the prices generally are the same as those obtaining before the war. The *Journal* further states that it seems unlikely that the extended production of medicinal herbs in this country would be successful as a commercial undertaking, except to those who have exceptional opportunities for disposing of their products. The greatest difficulty seems to be the expense of collecting small quantities grown in scattered situations, and of properly drying them.

Digitized by Google

International Horticultural Congress at Amsterdam.—The programme of the International Horticultural Congress, organised by the Royal Netherlands Horticultural and Botanic Society in commemoration of its fiftieth anniversary, to be held at Amsterdam on September 17-23, to which we referred in our issue for March 24, p. 155, has been issued, and those who contemplate attending will find in it much useful information as to travelling, hotel accommodation and the programme of events. The Secretary is M. J. Sirks, D.Sc., Bergweg 62, Wageningen, Holland.

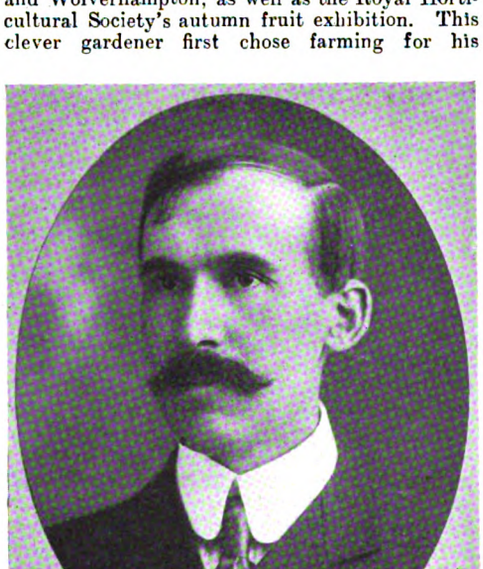
The Testing of Vegetable Seeds.—Mr. C. B. Saunders, Chief Officer, Official Seed Testing Station for England and Wales, has published some interesting particulars* of the testing of vegetable seeds. He states that seeds of all Crucifers, Onion, Carrot, and Turnip, are germinated on filter paper in petri dishes and present very few difficulties. In the early autumn freshly harvested seeds of Crucifers germinate rather slowly, and no satisfactory method has yet been discovered of hastening the germination of this class of seed. With regard to Parsnip seed, it is found if it is placed on the surface of moist sand it often germinates better than if placed upon filter paper. The testing of Beet seeds calls for a special method, as the clusters vary in size, some samples containing large ones and others small, with the result that germination may be uneven. The practice is to pass the purified sample through a series of sieves, in order to divide it up into three portions, large, medium, and small clusters. The sample having been graded in this way, the number of clusters in each heap is counted and expressed as a percentage of the total, then, in counting out the separate hundred for germination, clusters are taken from each of the three heaps in proportion to these percentages. Beet seed is germinated in sand in aluminium dishes. Celery, Parsley, and some other seeds belonging to the Umbelliferae, which germinate slowly, always give better results on the Copenhagen tank than they do in petri dishes in a cabinet incubator. Most Grasses seem to germinate in light better than in darkness.

Imperial Fruit Show.—The secretary of the Imperial Fruit Show, Mr. J. F. Tamblyn, 18, Bedford Square, W.C., directs our attention to a competition for small exhibits for growers of fruit, either commercial or amateur, at the Imperial Fruit Show to be held at Manchester from October 26 to November 3. The sum of £60 is offered in prizes in this section, which comprises six classes for Apples and Pears staged on plates.

Forest Fires in the South of France.—During the recent warm weather many forest fires occurred in different parts of the South of France near Nice and Cannes, and so fiercely did the flames consume and spread that the once beautiful forests of Esterel and the Maures, the pride of the Côte d'Azur, to-day present saddening spectacles of charred desolation. It is roughly computed that 50,000 acres have been absolutely ruined, and according to one report the destruction of Mimosas alone represents a loss of £50,000. The flames travelled quickly, and panic seized the populations of the villages in the track of the blazing woodlands. At many points of the coast where the woodland reaches to the water's edge it was the sea alone that arrested the progress of destruction. Apart from the lamentable destruction of forests and villages, many isolated villages have been destroyed, including property not far from St Aygulf, belonging to M. Franklin Bouillon, Deputy for the Seine et Oise. Besides the fires in the Riviera, there have been similar conflagrations in other parts of France. Much alarm was caused by two outbreaks in the incomparable Forest of Fontainebleau, familiar to so many visitors to Paris. Fortunately the flames were subdued by a large force of soldiers, but in one place an area of something like 250 acres had already been destroyed.

* *Methods of Seed Analysis.* By C. B. Saunders. The National Institute of Agricultural Botany, Huntingdon Road, Cambridge. Price 1s. 1d., post free.

Mr. S. Barker.—Mr. S. Barker, the Duke of Newcastle's gardener at Clumber, Worksop, will be known, at least by name, to most of our readers, for he ranks amongst the most skilful cultivators of indoor fruits in this country, and he has many successes to his credit at all the chief shows up and down the country. Visitors to the Shrewsbury show, which was held on the 15th and 16th inst., and especially professional gardeners, were delighted to see that Mr. Barker had again entered the lists in the fruit classes, after being absent from the show as a competitor for six years, and he again won the first prize for the champion table of dessert fruit of thirty dishes, an honour which may be regarded as the blue ribbon of the fruit-growing world. Besides being first in this class, Mr. Barker also won many prizes in the Grape classes, thus repeating his successes of 1917, the last occasion when he exhibited at Shrewsbury. Mr. Barker's name is equally well known at other important shows, such as those of York and Wolverhampton, as well as the Royal Horticultural Society's autumn fruit exhibition. This clever gardener first chose farming for his



MR. S. BARKER.

profession, for he comes of an agricultural stock, but he soon left farming for horticulture, and whilst in his teens was engaged in Grape growing at the Vineries, Littleover, Derby. He was also later employed in Messrs. Robert Owen's Nurseries, at Marden, at Mr. Philip Ladd's Nurseries, at Swanley, at the Horticultural College, Swanley, and at Winslade Gardens, Exeter. He was subsequently appointed plant foreman and Rose grower at Blenheim, Woodstock, under Mr. Whillans, where he remained two years, leaving to take up the position of foreman in Lord Burton's Gardens at Rangemore. There he remained under Mr. Bennett for six years, until he was appointed gardener at Clumber, in 1899. Although Mr. Barker's reputation is so high as a cultivator of indoor fruits, he has won many prizes for other subjects, including indoor Carnations and hardy fruits. His skill as a Grape grower is shown by his winning the prize in the chief class for Grapes at the R.H.S. autumn fruit show for five years in succession, that is, from 1911-1917, the show being discontinued in 1914, owing to the outbreak of war. The cultivation of choice indoor fruits has always been regarded as the highest test of the skill of a gardener, and although the opportunities for growing and exhibiting are not what they were before the war, we are glad to know that there are still gardeners like Mr. Barker who can grow and show fruit of the finest possible quality.

Appointment.—Dr. George H. Pethybridge, formerly head of the Seed and Plant Disease Division of the Department of Agriculture and Technical Instruction for Ireland, has been appointed mycologist to the Ministry of Agriculture and Fisheries for England. Dr. Pethybridge's work on Potato diseases is well known, and, being a man of very sound judgment, the appointment will meet with the general approval of growers.

National Dahlia Society.—The annual show of this society will be held in the R.H.S. Hall on Wednesday, September 5, when a splendid display is anticipated. Schedules and particulars may be obtained from the Hon. Secretary, Mr. A. C. Bartlett, 318, Kew Road, Kew.

Display of Nursery Stock.—A writer in the *National Nurseryman* of America draws attention to the value of railways for displaying nursery stock to the public. He states: "Many of the railroads have recognised the value of beauty along their ways, and millions of dollars have been spent to make things pleasing, apart from their usefulness, and it can readily be conceived that the railroad has great potential possibilities in helping the nurseryman to display his goods. A well-conceived plan, devised for co-operation with the railroads, would serve the double purpose of beautifying the railroad's right-of-way and so benefiting the railroad and travelling public, and would also be the best possible means of publicity for the nurseryman." English travellers who have seen and admired the beautiful displays of Messrs. Sutton and Sons at Reading, Messrs. James Carter and Co. at Raynes Park, Messrs. Allwood Bros. at Wivelsfield, and others which could be equally commended, will agree with the American writer that much more could well be done in this way, to the advantage alike of the nurseryman and the travelling public.

Potato Imports.—Imports of Potatos registered during the week ending 28th July consisted of 3,364 tons from France, 2,800 tons from Holland, 392 tons from Spain, 287 tons from the Channel Islands, 198 tons from the Irish Free State, 117 tons from Belgium, 50 tons from Italy, and 15 tons from the Canary Islands, a total of 7,223 tons, against 6,881 tons during the previous week.

Agricultural Credits Act, 1923.—The Agricultural Credits Act, which received the Royal Assent on the 31st ult., provides the following credit facilities for agriculturists. Section 1 empowers the Public Works Loan Commissioners to lend money to "approved associations" for the purposes of making advances on mortgages, also to lend money direct to borrowers, subject, in both cases, to certain conditions. The amount secured by the mortgage must be repayable within a period of 60 years, and must not exceed 75 per cent. of the value of the land, as ascertained to the satisfaction of the Public Works Loan Commissioners at the date when the advance by the Commissioners is made. In the case where the repayment extends over the full period of 60 years, the rate of interest and sinking fund will be approximately 5½ per cent. It should, however, be borne in mind that these facilities are limited to those farmers who agreed to purchase their holdings not earlier than the 5th day of April, 1917, nor later than the 27th day of June, 1921, and that the land comprised in the mortgage must be wholly or mainly agricultural land. Those eligible for, and desirous of taking advantage of, the facilities offered by this section, can do so by making formal application to the Farmers' Land Purchase Company, 1, Great George Street, Westminster, S.W.1, or to the Secretary, Public Works Loan Board, Old Jewry, E.C.2. Under Section 2 the Minister of Agriculture is empowered to promote the formation of Agricultural Credit Societies, having for their object, or one of their objects, the carrying on of the business of combining the credit of their members, so as to enable them, with the assistance of advances from the Minister of Agriculture,

Digitized by Google

to make loans to their members, repayable within a period not exceeding 5 years, for such agricultural purposes as may be approved by the Minister. These societies will be required to register under the Industrial and Provident Societies Acts, 1893-1913, to adopt rules approved by the Minister and the Chief Registrar, and will be entitled, subject to Treasury regulations, to apply to the Minister of Agriculture for advances up to a limit of £1 for every £1 share held by their members. A set of model rules has been drawn up, and copies will be obtainable from His Majesty's Stationery Office, Imperial House, Kingsway, W.C., at an early date. The relevant Treasury Regulations will also be obtainable from the same source. The share capital of such societies will consist of an unlimited number of £1 shares, on which 5s. per share shall be paid up on allotment. There is no limit placed on the number of shares that any member may hold, but every member must hold at least one share. A member may make application to his society for loans up to the limit of £5 for each £1 share held by the member provided that this sum does not exceed one-tenth of the total share capital of the society for the time being issued. Those interested in the matter, or desirous of forming a society or of ascertaining whether a society is in process of formation in their locality, should communicate with the Secretary, the Ministry of Agriculture and Fisheries, 10, Whitehall Place, S.W.1. Section 3 of the Act extends the facilities offered by the Improvement of Land Acts. The owners of agricultural estates, who wish to undertake permanent improvements such as the erection or extension of farm buildings and cottages, the making of roads, sewers, drains, etc., or the erection of silos, can obtain full particulars from the Lands Improvement Company 1, Great George Street, Westminster, S.W.1, which operates under the Improvement of Land Acts.

Appointments for the Ensuing Week.—Wednesday, August 29: Mitcham, Tooting and District Horticultural Society's meeting; Sandy and District Horticultural Society's show; Derbyshire Agricultural and Horticultural Society's show; Dunbar Flower Show; Helensburgh and Gareloch Flower Show; Lanark Flower Show. Thursday, August 30: Royal Oxfordshire Horticultural Society's show; Sandy and District Horticultural Society's show; Ayton Flower Show; Dundee Flower Show (three days). Saturday, September 1: Bannockburn Flower Show; Blackburn and District Horticultural Society's meeting; Dalrymple Flower Show; Selkirk Flower Show; Douglas (Lanark) Flower Show; Cambuslang Flower Show; Duns Flower Show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Cambridge Botanic Garden.* Our readers will be glad to learn that the new garden here progresses favourably under the praiseworthy exertions of Mr. Murray. He has planted the new ground with as complete a set of trees and shrubs capable of bearing our climate as can well be procured. He has removed from the old ground specimens of all the herbaceous plants which were growing there, and he has further circulated printed lists of such hardy herbaceous plants as he has not yet procured, with a request that those who may be able and willing to supply any of them, would return the list marked, for the purpose of enabling him to make a selection from one or other accordingly. As the time for removing hardy perennials is near at hand, he is very desirous of receiving these return lists, of which as yet we learn only a very few have been sent him; and we are sure, when we mention the trouble and interest Mr. Murray is taking in getting together as perfect a collection of hardy plants as the case may admit, we have only thus to make his desires known to have them attended to. *Gard. Chron., August* 19, 1848.

THE BULB GARDEN.

A NEW HYBRID LILY.

It cannot be said that Lilies have been much improved by the art of the hybridist; on the contrary, the Lily has, in this respect, been the most neglected of all garden plants. Within recent years, however, some attention has been given to the crossing of Lilies, and in consequence we have a whole range of hybrids between Martagon and Hansonii, but the best known Lily hybrid is undoubtedly L. testaceum (syn. excelsum), better known as the Nankeen Lily. This hybrid is said to be the result of crossing L. candidum and L. chalcedonicum, but its origin, curiously enough, remains a mystery. The Lily illustrated in

FIG. 40.—LILY WHITE KNIGHT, A HYBRID BETWEEN L. TESTACEUM AND L. CANDIDUM.

Fig. 40, named White Knight, was raised by crossing L. testaceum with its parent, L. candidum. The flowers, borne on tall, stately stems, are of a pure glistening white, with golden anthers. The newcomer resembles L. testaceum in form, foliage and habit; in fact, in everything but colour. *Herbert Cowley.*

IRISES.

WHICH IS THE ORRIS ROOT?

The Iris generally sent out from English nurseries as the "Orris root" is Iris florentina, but the editorial note (see *Gard. Chron.* of August 11, page 81) leaves the impression that this product is obtained from Iris germanica and Iris pallida, and not from Iris florentina. The difference is, I think, a question of nomenclature, as Iris florentina is sometimes regarded as a form of Iris germanica even though there are grave doubts about the specific rank of Iris germanica.

Writing of Iris florentina in *The Genus Iris*, Mr. W. R. Dykes states:—"The variety is well known in gardens, where it flowers in May with I. germanica. Hitherto it has been given specific rank, but it is difficult to separate it by any character except colour from I. germanica, with which it agrees in its inflorescence, in the character of the spathes, in the narrow leaves that attain some length before midwinter, and in the formation of the tube and ovary. The similarity between the two plants had already struck me, and my impression of their identity was confirmed last year (1911) by the flowering of a plant which I had obtained from Florence through the kindness of Messrs. Barr and Sons. It occurred among a batch of plants that were obtained as specimens of the source of "Orris Root," and, besides showing that Iris germanica and I. pallida are used indiscriminately for that purpose, they also provided an exact purple counterpart of I. florentina. This Florentine example of I. germanica had slightly more scarious spathes and longer, narrower falls than those of the purple form most commonly known in English gardens. These two characters are typical of the variety florentina, as is also the slender stem."

We may take it from this that I. florentina and its purple counterpart are used in the supply of Orris Root. There is a misprint in my note on page 81. For the "propagation" of Orris Root please read "preparation" of Orris Root. *Herbert Cowley.*

The Week's Work.

THE FLOWER GARDEN.

By C. Turner, Gardener to Emily, Lady Ampthill, Ampthill Park, Ampthill, Bedfordshire.

Taking Cuttings.—The precise date for beginning to propagate next year's stocks of soft-wooded plants will vary in different localities, according to the season, while the quantity to be dealt with must also be taken into account. To prevent too much denuding of the beds at one time, the work of taking cuttings should, where many plants have to be raised, be spread over two or three occasions. Beside taking cuttings, it is advisable to retain some of the old plants as stock specimens when clearing the beds on the approach of frost, potting or boxing these plants as may be most convenient. This should be adopted in the case of practically all tender bedding plants.

Cuttings of Shrubs.—In some gardens it is a rule to insert a few or many cuttings of various kinds of shrubs during the next few weeks. All the hardier types will do quite well dibbled in rows in the open ground, while the more delicate may have the protection of a cold frame, or, failing such a provision, a wall or fence would provide some protection. See that all cuttings are made firm in the soil and also watered.

Watering Wall-Plants.—The hot, dry weather has rendered this work imperative, especially where the soil is of a light and porous nature. Newly-planted subjects in particular should be looked to, and any that are finishing their growth. In prolonged dry spells even strong growing plants, such as Rambler Roses, show the need of water by the foliage becoming mildewed and the lower leaves turning yellow.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to J. A. Berners, Esq., Woolverstone Park Gardens, Ipswich.

Pot Vines.—Vines in pots may shortly be transferred to a sheltered position out-of-doors, where they will receive the benefit of full sunshine to mature the canes. The pots should be plunged, or otherwise protected from bright sunshine and drying winds. It is desirable to preserve the principal leaves in a healthy condition for as long as possible, and to this end the roots will require to be watered carefully until the foliage ripens and falls. Later, the lateral growths may be gradually reduced to divert the whole energy of the vine into the main bud.

Care of the Roots.—When removing the old soil great care must be exercised to prevent any fibrous roots being damaged. As the roots are cleared bind them up in wet stable litter and mats, to prevent them from drying out. When replacing the roots any damaged portions should be removed by means of a sharp knife. Lay out the roots regularly throughout the border, placing some of the strongest near the top, say, 7 inches to 9 inches below the surface, and as each layer of roots is placed in position, damp them before adding a fresh layer of soil. If the soil is reasonably moist, inside borders will require no water until the house is closed. An outside border will naturally receive sufficient moisture from the autumn rains, and in the latter case it is advisable to guard against an excess of moisture by covering the border with shutters, corrugated iron sheets, or spare lights, the last for preference, as they permit the sun's rays to pass through and warm the soil. During the time the work is proceeding, and for a week or two after its completion, shade the vines on bright days, keep the house close, and syringe the vines several times a day if the weather be bright and sunny. When the foliage has recovered from the check caused by root disturbance more air may be given, and syringing gradually discontinued.

PLANTS UNDER GLASS.

By John Coutts, Assistant Curator, Royal Botanic Gardens, Kew.

Souvenir de la Malmaison Carnations.—Plants which were propagated by layering some time since should be ready for lifting and potting. Before lifting they should be thoroughly soaked at the roots the previous day; 48-sized pots are usually large enough for these newly-rooted layers. The potting compost should consist of good mellow loam, and little or no leaf-mould should be added to it; instead of sand old mortar rubble may be used to render the compost open and porous, as all Carnations enjoy lime in the soil. The potting compost should be rammed fairly firmly, and the plants stood in cold frames, which should be kept fairly close for a few days, and shaded during bright sunshine.

Winter or Perpetual-flowering Carnations.—In most gardens this type of Carnation has taken the place of Malmaisons. Where they are stood out-of-doors means should be taken to protect them from heavy rains, as an excess of moisture is almost sure to lead to an attack of rust; and the only sure way of preventing or curing this is to keep the plants fairly dry at the roots. On no account should any moisture be allowed on the foliage, as this is a sure means of starting and propagating the disease. Certain varieties, such as Carola, should never be stood in the open, as they are almost certain to get rust. In any case, all the plants should be placed under cover towards the end of the present month. Plants of earlier-flowering batches, that have filled their pots with roots, should receive some approved fertiliser, of which there are numbers specially compounded for Carnations. Good guano is, however, a suitable general manure for all classes of plants. Successional batches of plants should be potted on as they require it.

Browallia Jamesonii.—If cuttings of this Browallia are inserted at this time, the resulting plants will, if they are grown steadily, make good specimens in 8-inch or 10-inch pots for next year. This plant needs full exposure to all the sun possible, and is a fine subject for planting out in a sunny greenhouse.

THE KITCHEN GARDEN.

By R. W. Thatcher, Gardener to Mark Firth, Esq., Carlton Park, Market Harborough, Leicestershire.

Celery.—This vegetable should be given special attention this month, as the plants are growing freely. All side shoots should be kept picked off. Dust the foliage occasionally with old soot on dull and showery days, if possible. Brown patches in the leaves should be removed by the hand, as these harbour the Celery maggot, and if the maggot is allowed to increase it will soon disfigure a whole row. Soot is not only a fine stimulant for Celery, but will help to keep this pest in check. If heads are required for early use, blanching may be commenced, which takes about six or seven weeks. The plants should first be watered copiously with diluted liquid manure on the previous day, and then a few inches of soil placed around the stems, taking care that none enters the hearts, or the latter will become deformed. The best method of blanching early Celery, however, is by bands of stiff brown paper, about 6 inches wide, tied around the plant as growth proceeds. It saves much labour, the roots may be watered while blanching is proceeding, and it is obvious that much finer produce is thus obtained. Strawy manure placed along the rows will greatly help to conserve the soil moisture, which will be a great advantage if the weather in August and September is very hot.

Celeriac.—This vegetable will not require much attention now, beyond keeping the plants well watered in hot weather, and stirring the surface of the soil with the Dutch hoe.

Asparagus.—Keep the Asparagus beds clean by hand weeding, and dust them with Asparagus manure, which the autumn rains will wash down to the roots. The strongest growths should be supported if they are likely to be blown down by strong winds.

Outdoor Tomatos.—Tomatos growing out-of-doors should have all side shoots picked out, and the foliage slightly reduced to allow sun and air to reach the fruit. When the plants have set four or five trusses, they should be stopped, as they will not ripen more fruits than this properly. Do not allow the plants to suffer for want of water.

HARDY FRUIT GARDEN.

By A. J. Hartless, Gardener to Major J. F. Harrison, King's Walden Bury, Hitchin, Hertfordshire.

Wasps and Earwigs.—Fruit growers who have had to contend with aphides and other insect pests early in the season are now troubled with wasps and earwigs, which are injuring their Peaches and Nectarines. It is some years since we have been so bothered with earwigs. We have used muslin bags for some of the fruits, but even these the earwigs have, in some cases, bored a hole through. In regard to wasps, farmers and others look upon wasps as an inevitable visitation, with the result that gardeners and fruit growers have to do the necessary destruction of the nests. Although all property owners should do their fair share in the destruction of these pests, no grower can afford a further loss of crops this year. Wasps have even attacked Apples here in early August.

Watering and Hoeing.—Trees that are cropping should not be allowed to suffer for want of moisture and watering, and feeding should be resorted to. Hoeing the surface soil should be done constantly. Impoverished trees may be given a dressing of a good fertiliser. A good plan, if the trees are enfeebled through repeated overcropping, is to cut the branches of standard trees hard back in the autumn or winter. The new growths will, if properly thinned and trained, soon produce larger and better fruit. The extension system may be applied equally to Apples and Pears. The gathering of fruit should be done carefully to avoid bruising.

THE ORCHID HOUSES.

By J. T. Barker, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

Newly-potted Cattleyas.—Cattleyas that have been potted recently should be treated in precisely the same manner as those that are not in need of it, and it is quite interesting to observe the development of fresh roots in the new material if the latter is kept on the dry side. When repotting any of these plants, it should be remembered that over-potting is an evil, and should be guarded against; the smaller the pot the better the safeguard against injury from excessive watering at the roots. In repotting this family, it will be found that there is great diversity in the nature of the roots, owing to the great variety of parentage in the different hybrids. The thick rooters are generally strong growers, and are capable of filling a larger receptacle with roots than those which make roots of a finer nature. The latter comprise some of the weakest and most delicate growers, and should be placed in the smallest receptacle possible. If potted and treated as advised, they will enter upon a long season of rest, so far as growth is concerned, and will break away in the spring with renewed energy, and produce their beautiful flowers freely. During the winter they should be grown in a dry, airy atmosphere, in a temperature of about 60°, with sufficient water to prevent them shrivelling. Cattleya Dowiana and its variety aurea, also its numerous hybrids, which produce their flowers during the autumn are growing freely, and should be placed at the warmer end of the house in order that the flowers may develop properly. After growth is completed, and the flowers are over, the plants should be treated as advised for C. Warscewiczii. Air and light are essential to the well being of this large family of plants, hence the necessity of keeping the glass of the houses in which they are grown clean, and especially in smoky districts. Cleansing the roof-glass both inside and out is work that will be well repaid for the trouble.

HARDY FLOWER BORDER.

DICENTRA SPECTABILIS.

This well-known plant, commonly called Bleeding Heart or Lyre Flower, is frequently forced for early floral decoration as a pot plant. Although fine examples are frequently met with in old cottage gardens, it has come to be regarded as unsuitable for ordinary outdoor cultivation. It was received originally from Siberia, and is therefore quite hardy, but requires a sheltered spot where cold winds cannot injure the young foliage, and so planted that the sun, in the event of frost, will not reach the young growth before it is thawed, or it may be severely damaged.

D. spectabilis is by far the best and most useful garden species, and in rich, well-drained soil will reach to a height of 18 inches or more, the several graceful stems laden with heart-shaped, pendulous flowers of a rich rosy tinge—hence the common name of Bleeding Heart.

The flowers are produced in May or June, and are continually opening for weeks. A variety was introduced some years ago, named alba, but it is of much weaker growth, and, as the blooms are not white, but of a pinkish hue, it does not justify its title. A pure white form would be valuable, and will probably come in due course.

The species eximea is very hardy. It is much smaller than spectabilis, and grows as freely as a weed. It is quite at home in a stiff soil, and passes unharmed through each winter. A thriving colony may easily be obtained from the planting of a single root, and the profusion of its red flowers makes it a desirable plant, although it lacks the grace of D. spectabilis. D. Cucullaria is known as the Dutchman's Breeches. This species is suitable for the rockery, being dwarf in habit; it bears white and yellow flowers.

All the Dicentra may be planted in autumn, and are, perhaps, better recognised under their old name of Dielytra. *T. D. T.*

NOTICES OF BOOKS.

Dwarf Conifers.*

This handbook is the work of an enthusiastic amateur, who both by practical experience and extensive reading is well qualified to add an original chapter to the history of Conifers of abnormal growth. In his garden at Knapton, near Abbeyleix, Mr. Hornibrook had the most varied collection of dwarf Conifers in existence. This collection, the amassing and study of which was a labour of love for many years, is now unhappily dispersed, but most of the larger specimens have been transplanted to Glasnevin, where they are flourishing on a grassy slope beside the rock garden. The book is exhaustive on both the practical and theoretical sides, no fewer than 460 different varieties of dwarf Conifers being described, as compared with 160 forms mentioned by Beissner, the latest authority. The origin and history of each variety is accompanied by a description sufficiently explicit to distinguish it; and in the case of any rare form not in general cultivation, an indication is given of where a plant of it can be found. Twenty-five well-chosen illustrations show the fascinating appearance of some of these pigmy trees.

Mr. Hornibrook's practical hints on the cultivation of his favourites will be read with pleasure by most gardeners. He recommends that dwarf Conifers should be grown either by themselves on the grassy slope of a hill or, better still, amongst ordinary flowering plants in rock gardens. The most ideal situation is an old sandstone quarry, in every chink or cranny of which a tiny Conifer was planted by him, and left to its own devices; and the effect now is indescribably charming. He grows them wherever there is room on lawns and on rockwork. He also grows a certain number in pots, which may be transplanted at any time of the year. These pots may be sunk in odd spots of the rockery, where alpines in flower at the moment are improved by the contrast. The annual growth of dwarf Conifers is so slow and sure that one can plant them freely amongst flowers, with a knowledge that they will not encroach. They are, of course, admirably adapted for small gardens, where ordinary trees are totally out of place.

Mr. Hornibrook's account of the great variety that reigns amongst dwarf Conifers deserves quoting in full:—"The little trees are found in many shapes; tiny fastigiate columns, compact cones, round ball-like shrubs; pyramids broad and narrow, and little bushes with flat tops; others with round, umbrella-like tops; low round or humped cushions. Bushes regular and irregular, with neat, compact, evenly arranged branchlets and foliage, and with the same twisted and contorted like a tangled head of hair.

"They also differ greatly in colour. Every shade of green will be found among them, likewise foliage of glaucous grey and blue, foliage all gold or silver, or splashed with either. Shrubs with young shoots, all white; shrubs which, while retaining their leaves, change their colour in winter. One must select coloured varieties with care, rejecting any that are not clear in colour or distinct in marking. Of glaucous blue forms, Juniperus virginiana var. Kosteri, Cupressus Lawsoniana var. Fletcheri, Abies concolor glauca compacta; and of golden foliaged forms, Juniperus chinensis var. aurea, Thuya occidentalis 'Rheingold,' and Chamaecyparis pisifera filifera aurea may be selected."

The scientific interest of the subject is not neglected. Natural dwarf trees are grouped by Mr. Hornibrook into three classes—first, such as have arisen in the seed-beds of nurseries. Some Conifers vary enormously from seed, and in certain species new forms are constantly appearing, showing variation in colour, height and habit. In other species dwarf forms are of rare occurrence. This tendency to vary and not vary is significant and deserves further study. The second class of dwarf forms result from environment. Self-sown seedlings of Conifers at high altitudes and in exposed situations become stunted in growth, and sometimes become prostrate shrubs, like a form of Juniperus virginiana, found growing wild on the sea cliffs of Maine. Plants of this, 18 inches high, have prostrate stems, which spread into dense mats 15 feet across. Such forms tend to revert to normal when cultivated in sheltered sites on good soil; while dwarf varieties, which originated as seedlings, usually retain their habit irrespective of age or situation. The third class of dwarf trees originate from a sport on a branch of an otherwise normal tree, and are propagated by cuttings or grafts. Witches' Brooms, with their strange conglomeration of branches, are a prolific source of these sports.

Minute directions are given as to modes of propagation. All varieties may be propagated by grafts; but this method should not be adopted, except as a last extremity, because grafted dwarfs usually grow stronger than those on their own roots, and are frequently affected by the characters of the stock. Grafted plants also frequently revert to normal. Most Conifers can be easily propagated by cuttings; in fact, Mr. Hornibrook has struck Taxus, Abies, Picea, Pseudotsuga, Tsuga, Sequoia, Cupressus, Thuya, Thujopsis and Juniperus. The only genera that he has failed to strike from cuttings are Pinus and Cedrus. He roots cuttings in sharp sand, both in autumn and spring, using either a single shoot of the current year's growth with a heel, or else a small branch with its branchlets; and a good percentage of both strike. Layering may be adopted when cuttings are hard to obtain or are not likely to strike readily. *A. Henry.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 5, Tavistock Street, Covent Garden, W.C.2.

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters, and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

SWEET WILLIAMS.

IT is not always convenient to grow the same kind of plant year after year, and among those left out of our arrangements in these gardens for some time past is the Sweet William. This season, after the lapse of some years, it is again being grown. In the dwarf Scarlet variety a marked improvement is seen in the brilliance of colouring; the dwarf Pink, Auricula-eyed variety, which comprises many fine forms, is very beautiful, and there are also mutable forms: a crimson-centred form, with white edge, is also grown. Besides these I call to remembrance pure white, dark crimson (also with dark foliage), and many double varieties, which were found useful for sending to London in the season, few flowers standing better when cut than these.

All the Sweet Williams are useful for massing. Many years ago, on calling on an old friend—Mr. Moorman, then at Victoria Park—the flowers which left the most vivid impression on my mind were Sweet Williams, grouped in very liberal masses. Even where there is not space to group different colours separately, they may be mixed with perfectly satisfactory results. William Cobbett, it may be recalled, was so greatly enamoured of the Sweet William as to regard it as the most beautiful of hardy flowers. Generally it has been depreciated for its lack of fragrance, its "homely cottage smell," as Clare describes it, but it certainly is scented, and pleasantly.

Although there is no record of the Sweet William earlier than the end of the sixteenth century, it is not unlikely that it was grown long previously. Names recorded by Lyte and Gerarde — Colemeniers, Tolmeniér, London Tufts, London Pride, Johns, and Sweet Johns —"the John so sweete of smell"—could hardly come into general use in a year or two, and this is borne out by the remark of the latter that they were "esteemed for their beauty to decke vp gardens, the bosomes of the beautifull, garlands and crownes for pleasure." Moreover it was a favourite with the poets—the "Sweet William small" of Cowley—and it was one of the flowers in Drayton's chaplet of flowers:—

"Sweet William, Campion, Sops-in-wine,
One by another neatly."

And how nicely Horace Smith makes it into a trisyllable:—

"In borrow'd lustre seem'd to sham
The Rose or red Sweet Wil-li-am."

By Parkinson's time varieties were sufficiently distinct to receive separate descriptions, names, and paragraphs, and he clearly separates the Sweet William from the Sweet John. He notes that "The Sweete John hath his leaves—narrower than Sweete Williams, set by couples, at the joynts of the stalkes—at the top, whereof stand many small flowers like unto small Pinkes—more deeply jagged than the Williams—of a small or soft sent." The scent of the Johns was all along regarded as better than that of its bigger contemporary. One of Parkinson's varieties was in colour a "murrey purple like velvet," and Rea describes this as the red velvet Sweet William. But there seems to have been slight, if any, improvement in the plant till well into the eighteenth century.

Miller, with others, mentions the variegated Sweet William, which is the same as our Auricula-eyed form, of which there is a very good coloured figure in *A Complete Dictionary of Practical Gardening*. The Sweet John seems to have gone out of cultivation more than a century ago, unless it is still retained in strains of dwarf Sweet Williams. It may be worth mentioning that in the old references to these plants "sweet" is employed as an adjective, Williams, for instance, being the name, and *sweet* is used to distinguish the plant from *wild* Williams.

It is scarcely needful to note anything about the cultivation of these flowers, only that I find the plants grow large enough for any purpose when the seeds are sown in May, and they continue in flower longer when transplanted into flowering position in autumn rather than in spring. It is possible to preserve any special plant if the spikes are removed before seed is formed, and the basal shoots are assisted by the application of some rich, fine soil, which promotes the formation of roots; such shoots may be "slipped" and planted in autumn.

Probably more interesting than the species are the hybrids that have been derived from it. The first heard of was Fairchild's Sweet William, better known as the mule Pink, and several instances are recorded of such hybrids in the eighteenth century. One of the very finest is the Dwarf Double, known also as Murray's and Ware's, concerning the history of which I have been unable to obtain any information but that it has long been known in Scotland. The flower heads are only six to nine inches in height, the colour bright crimson, and the plant is increased in autumn from self-rooted shoots. It is a true mule. The two following are probably lost to cultivation: Grievei, the parentage being a Sweet William and a laced Pink, and Lindsayi, from a Sweet William and Dianthus alpinus. In 1901 the hybrid named Lady Dixon was exhibited in London; this is a reputed cross between a Sweet William and a Carnation—a cross which some people regard as impossible. These are all difficult to keep alive.

Mr. C. Elliott, in the interesting note on Dianthus Atkinsonii (see p. 70), is almost certain that a Sweet William is one of the parents. Of this there is no record so far as I am aware. I have not seen the plant for very many years. The following extract from *The Book of the Carnation* contains all that I know of its origin. "This is one of the most gloriously beautiful of the mule Pinks, and is supposed to have been the offspring of D. chinensis. It was raised about the year 1845 by Mrs. Atkinson, of Bacton Hall, Norfolk. The flowers are blood-red, one and a half to two and a half inches across, borne on slender stems over a foot high. It has never been known to produce seeds (I have had seeds sent me, but the plants were another thing altogether), and flowers so profusely that, like Napoleon III., it is difficult to perpetuate, or in many soils to preserve, as after flowering the plant is apt to die." Plants not permitted to flower, however, produce cuttings. *R. P. Brotherston, Tyninghame Gardens, Prestonkirk.*

GARDEN NOTES FROM S.W. SCOTLAND.

REPORTS of extreme drought in the south afford strange reading for us north of Tweed, inasmuch as we have had abundant rain throughout July and the first week of August. The proverbial Lammas floods were punctuated on the 2nd and 3rd of that month by the most violent south-easterly gale that anyone now living can remember in that month. The flower garden was a sorry sight in the morning—all the more so for the damage wrought upon the Madonna and Nankeen Lilies, which were in fine flower, several stems being blown clean out of the ground. L. regale was knocked about, but the stems of that species and of L. pseudo-tigrinum (a very fine thing, deserving a more satisfactory name) have a wiry consistency that resists storm better than those of greater succulence.

If we have not got entirely free from the dread fungus, Botrytis cinerea, we may claim, to use a phrase of somewhat ambiguous reputation, "to have the situation well in hand." The general crop is free from the fungus, although here and there are clumps of Madonna and Nankeen Lilies severely affected in places where the foliage was damaged by rough winds. The most obstinate case is that of L. chalcedonicum; but I do not despair of ensuring that brilliant Lily against infection by a course of treatment that has proved effective with the others. That treatment proceeds on the assumption that the fungus is not the primary agent in the disease, but the symptom and concomitant of impaired vitality in the plant. Failure of vigour in animals and plants is well recognised as an invitation to parasitic attack. An unhealthy dog becomes lousy; a brook trout, the very type of lustre and energy when in health, becomes the prey of leeches and copepods when its health is affected by an injury or old age; Dasyscypha calycina, that minute fungus which has rendered it futile to plant the European Larch in a considerable part of Great Britain, may be detected in Continental Larch forests, but never prevails to injure the trees, indicating that some adverse condition in parts of Great Britain has lowered the Larch's power of resisting the parasite. Small colonies of it may be found on the Japanese Larch in this country, but the extraordinary vigour of that species sets the pest at defiance.

So it is, in my belief, with Lilies. If means can be found to keep them in vigorous health the gardener may snap his fingers at Botrytis. I attribute the measure of success we have attained to a liberal use of wood ashes. In planting the bulbs we set them in a nidus of sharp sand and wood ash in equal proportion and spread a good mulch of the same material over them annually. The potash in the ash acts as a stimulant to growth, while the particles of charcoal serve as an antiseptic and as an obstacle to slugs. Care must, of course, be taken to keep the ash dry until it is applied, because the potash is readily soluble, and a single heavy shower of rain suffices to wash it out of the heap. It may be noted that the percentage of potash in the ash of small branches and foliage is considerably higher than in that of timber. Professor Henry Greenish kindly undertook for me to ascertain the percentage of potash in the ash of dried Bracken. His report may be summarised in his own words: "For practical purposes you may assume that 50 tons of the dried Fern would yield an ash containing one ton of potash." This was the result of testing Bracken cut in July. In a subsequent letter he informed me that the Fern yielded a higher percentage of potash when cut in September. Do not let me be understood to prescribe wood ashes as a specific remedy for Botrytis. The spores of that fungus are always present, ready to take advantage of any weakly plant as a nidus. All I wish to submit is that enormous quantities of the ash are wasted through neglecting the precaution of securing it before it is ruined by rain; that it is a valuable stimulant for all bulbous plants; that it is a waste product in every garden, and that its application to Lilies here has been followed by a marked diminution of Botrytis.

Two species of Lily have flowered here this summer for the first time, namely, L. Burbankii, a reputed hybrid between L. pardalinum and L. washingtonianum—a ruddy orange Martagon with crimson anthers, and L. Duchartrei—Farrar's "marble Martagon," silvery white, flushed with rose and mottled with violet. Both are Lilies of merit, and their present vigour seems to imply a good constitution.

The Himalayan Cyananthus lobatus has always proved refractory here. Time after

Digitized by Google

time it has been planted, seldom surviving more than one of our dripping west-country winters, and invariably disappearing in a second one. Farrer's Cynanthus has behaved very differently. Two little plants were given to me last year. They were stuck in at the foot of a retaining wall, one facing south, the other west. I forgot all about them till one day in August a gleam of blue from a tangle of Saxifraga aizoides caught my eye. Methought it was a Gentian; but on clearing away the Saxifrage, there was a nice mat of Cyananthus nine inches wide, with half a dozen expanded blooms, and plenty more to come. The other plant has done equally well. The flowers are smaller than those of C. lobatus, but of the same glistening blue. *Herbert Maxwell, Monreith.*

INDOOR PLANTS.

KALOSANTHES (CRASSULA) COCCINEA.

This is one of the most brilliant greenhouse plants in cultivation, and is useful for many kinds of decorative work. The flowers are very fragrant, red or scarlet in colour, and are borne in trusses at the extreme points of the shoots, so that every cluster of flower is very prominent and shows itself to great advantage under any circumstances. It is a first-rate plant in every respect, and will grow and flower without much attention. Established plants will thrive and flower freely in the temperature of a comparatively cool greenhouse in 4-inch and 5-inch pots; they do not do so well if overpotted. The plants, being succulents, do not require a great deal of water when well established in their pots, but during the two or three months of their active growth they require more water, with plenty of sunlight and air, free from draughts. If planted in the beginning of June, the brilliantly coloured flowers make a striking display for six to eight weeks in outdoor beds during July and August.

Cuttings root freely in slight bottom heat; they should be watered sparingly until rooted, for, being succulent plants, they are liable to rot if given too much moisture. A good time for taking cuttings is during August and September; those inserted early form plenty of roots before the winter. The best cuttings are made from the tops of the shoots that have not flowered; all the old shoots, when cut back, will also make good cuttings. Insert the cuttings singly in small pots, give water to settle the soil, and place the pots, when rooted, in a cool frame or on the shelf in a greenhouse, but do not shade them. During the winter the plants require to be kept in a temperature about 40° to 45°, and they need very little water, especially during the depth of winter.

In the spring, when the plant commences to grow, give them a little more than the ordinary greenhouse temperature for a few weeks, and pinch out the tops to encourage them to produce more shoots, which will in due course grow and form fine specimen plants. Often more shoots develop than are required, and in this case the weaker ones should be removed to give more vigour to the others that remain; four to six shoots on each plant are sufficient, according to its strength. When the plant commences to grow, it should be repotted in rich compost, consisting of light, turfy loam, with a little leaf mould and silver sand added. The pots should be well drained. After potting, continue to give the plants a little fire-heat for a short time in order to have them in full vigour by the end of May. The earlier in the summer they finish their growth the more time is available for the ripening of the shoots and formation of their flower buds. After flowering, the plants should be cut back to within 2 inches to 3 inches from the base; a succession of shoots will then be obtained for flowering. The old, cut-back plants may be grown on, and, if repotted in the spring, will flower freely during the summer

CRASSULA FALCATA.

Crassula (Rochea) falcata is a pretty, succulent plant, but very seldom met with at the present day. It is an old favourite, almost forgotten, a very attractive and striking plant, having corymbs of bright orange-crimson flowers freely produced on dwarf plants growing in small pots and requiring very little trouble or attention. It is a most suitable subject for growing in a small greenhouse on a shelf or stage near the roof-glass. It will also thrive and flower in cottage windows, provided it has plenty of light and air. Like all succulent plants, this Crassula requires very little water during the winter, when a temperature of about 40° to 45° suffices. This Crassula is increased by cuttings, and should be treated similarly to Kalosanthe.

KALANCHOE FLAMMEA.

Kalanchoe flammea is a beautiful greenhouse plant introduced from East Africa in the 'nineties of the last century, and, when it flowered for the first time, was considered to be one of the best indoor plants that had been introduced of late years, and a future was predicted for it equal to that well-known Crassula coccinea, but for some unexplained cause it is seldom met with in cultivation at the present day. It is a most remarkable plant, bearing large clusters of brilliantly coloured, orange-scarlet flowers that are carried well above the foliage, and remaining in bloom for several weeks; when cut, the inflorescences remain in good condition in water for eight or ten days. This plant will thrive and flower freely in a comparatively cool greenhouse in which the temperature is about 50° to 55°. Exposure to the light is essential. This Kalanchoe is exceedingly useful for the decoration of the greenhouse, conservatory, dwelling-rooms, and table decoration. It is easily propagated from cuttings taken from the base of the plant after flowering. The plant will flower in about eighteen months from the time of inserting the cuttings, and will bloom freely in 3-inch to 6-inch pots.

All succulent plants root freely from cuttings placed under hand-lights with slight warmth, and require but very little water. When growing in the spring, they require more moisture and plenty of air free from draughts, with abundant sunlight. *John Heal, V.M.H.*

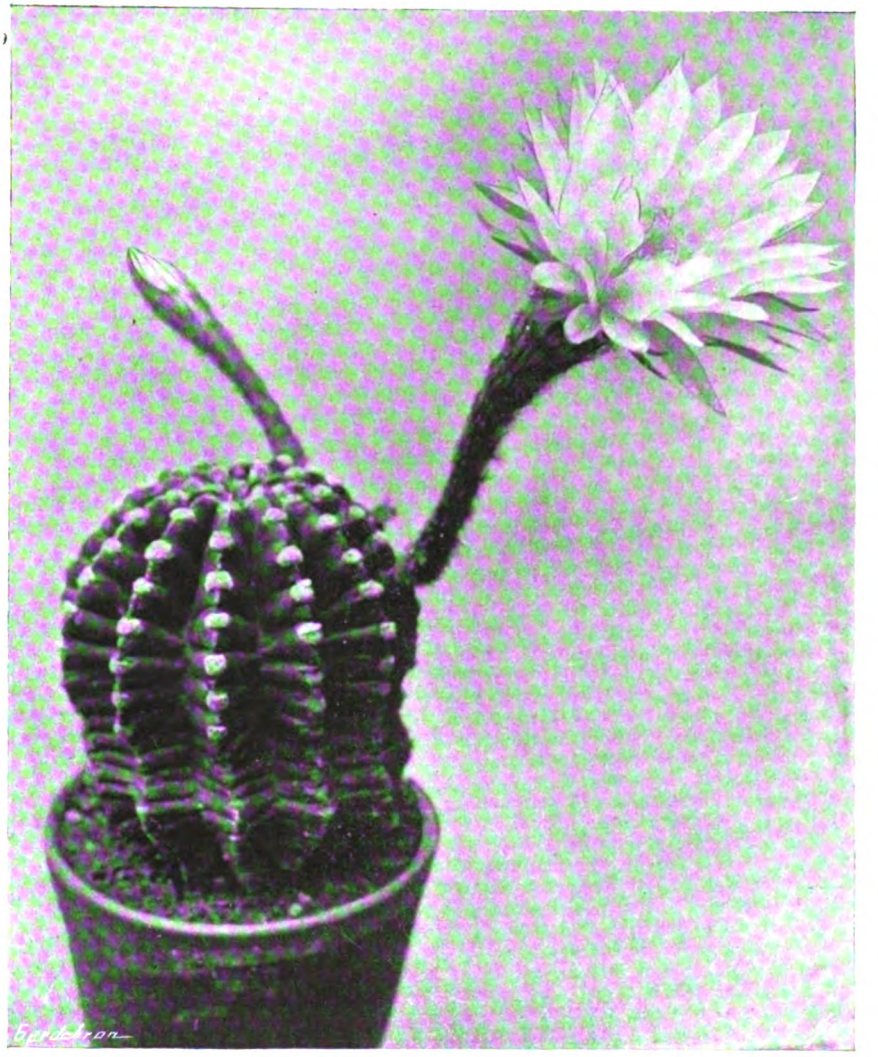

FIG. 42.—CEREUS SCHELHASII.

PLANTS NEW OR NOTEWORTHY.

CEREUS SCHELHASII.

Purchased for Glasnevin from Messrs. Seaward in 1920, Cereus Schelhasii flowered recently, and is one of the most attractive species of the genus, although little seems to be known of its origin. The plant is about eight inches high, cylindrical in form, with twelve prominent ribs. From the summit to about half-way to the base the ribs are furnished with small, dense cushions of grey tomentum, from amongst which project slightly, short, sharp, blackish spines; with age these spines and tomentum disappear. The flowers are of beautiful shell-pink colour, with a tube about six inches long, and furnished with numerous dark hairs.

Labouret in his *Monographie des Cactées* gives as a synonym Echinocactus Eyriesii var. glaucus, *Bot. Reg.*, Vol. 24, t. 31, but the plant there figured is more globular in form with apparently longer spines, whilst the tube of the flower is green, the outer whorls of the flower green and the inner ones white. *J. W. Besant, Glasnevin Botanic Gardens.*

ORCHID NOTES AND GLEANINGS.

DISAS.

Over one hundred and fifty species of Disa distributed throughout Africa have been recorded, the species inhabiting South Africa only being known in gardens, and of these species, while a few have proved excellent subjects under cultivation and have given the most satisfactory results in the hands of the hybridist, many have proved refractory, and by far the greater part have not been introduced. Disa forms one of the most important sub-tribes of the Ophrydeae, and its members comprise Satyrium, in which the lip is the important feature in the flower, being large, superior, galeate and spurred. In Disa proper the arrangement is reversed, the large dorsal sepal being uppermost, galeate, and the most important feature in the flower, while the petals, which are usually inconspicuous, are situated beneath the dorsal sepal.

Disas may be separated into two main classes —those which include the blue Disas of the D. graminifolia section, which form new tubers, while the old ones gradually decline after flowering; and the practically evergreen section, which has for its central figure D. grandiflora (uniflora), these, while depending mainly on their tubers, progress by stolons forming new growths and tubers.

Disa grandiflora, as it will always be known in gardens, and the central figure in garden Disas, known in its native habitat and also in gardens as "Pride of Table Mountain," was flowered for the first time in Europe in June, 1825, by Mr. Griffin, of South Lambeth; as the specimen was sent him from Cape Town, the species will soon attain its centenary of introduction. Since that time, whilst being a joy to some who have succeeded in meeting its requirements, it has been a source of disappointment to many. The vigour of the plants and the profuse manner in which they produce their large, brilliant, scarlet flowers in the hands of some prove that there is nothing delicate in the constitution of the species if suitable treatment be accorded. Where Disas are treated as Orchid house plants all the year round they collapse in time, but when grown in more airy conditions and a greenhouse temperature with a reasonable amount of sunlight, they are not difficult subjects. Mr. Burkinshaw, one of the most successful growers of Disa grandiflora, records that in the winter of 1894 his plants experienced two or three degrees of frost, which damaged their leaves, but they developed fifty or more spikes of unusually large and brilliant flowers. Others have had similar experience, but in the management of Disas, while adhering to greenhouse treatment in winter, frost should be kept out with a good margin. Mr. Burkinshaw and others recommend greenhouse treatment and a moderate supply of water until February, when a more liberal supply of moisture should be given them, rain water being used when possible until the flowering is over. The best month in which to repot Disas is September. Disa has always been a favourite genus with me, and having many South African correspondents, I took pains to interest some of them in these Orchids with a view to the introduction of those beautiful species which were known only by descriptions and figures, and especially those of the D. grandiflora section. One of my earliest ventures was a doubtful success. A friend had written me about the beauty and variety of D. grandiflora in a certain locality, and I asked him to send me some tubers. He interpreted the request liberally and forwarded a large, glazed Wardian case which contained some still wet slices of South Africa, but only a few pieces of Disa in a very bad condition. My friend's idea was that Disas could be grown best if their native soil was available to start them. I have seen the same practice carried out with other species, which invariably failed, and I conclude that a change in the surroundings is better in all particulars when the subject is removed to a new home.

The introduction of those two charming species, Disa racemosa and D. tripetaloides, which, hybridised with D. grandiflora, have given us the many beautiful hybrids which now adorn our gardens, came as the reward of long endeavour. My two best correspondents were the late Mr. W. Tuck, of Grahamstown, and Mr. Jas. Hall, then of Port Elizabeth, both of whom knew the locality of these species, although the names D. secunda, D. venosa and D. racemosa were confused. After a time both started on the mission, and Mr. Tuck sent D. racemosa as we know it, but Mr. Hall sent a few D. racemosa as D. venosa, and the charming species D. tripetaloides as D. racemosa. It remained for Mr. N. E. Brown, of the Kew Herbarium, to put the matter right, which he did in his description of Disa tripetaloides in *Gard. Chron.*, March 23, 1889, p. 360, from a plant I took him, and in which its complicated nomenclature is clearly defined. The species was afterwards illustrated in *Gard. Chron.* June 21, 1890; D. racemosa was previously illustrated in the issue for May 12, 1888, p. 593.

With the exception of a plant of D. racemosa which Mr. W. Watson brought from the Cape to Kew, the above mentioned importation is the sole material from which our garden plants of these two species, and the many hybrids, have originated. Mr Hall gave as their habitat van Stadtens Gorge, and was enthusiastic about the beauty of the rocky rivulets beside which the plants were growing.

It may be useful to mention how these plants were packed, for there are others of the beautiful class yet to import, and it is to be hoped someone will take the trouble to secure them. Strong growing tubers with leaves were selected and placed six or seven together in a thin covering of the moss growing near them, and no moisture was given beyond what the living moss contained. The little bunches of Disa were then placed in layers in a small deal box, which was sent off at once, and the plants came as fresh almost as when they were collected. The explanation of the success is that they were packed where collected with their natural moisture, no water was added, and they were sent off as soon as possible. On arrival they grew as though they had not been disturbed. It is above all desirable that these and other rare species should have their place in gardens secured by raising them from seed. *James O'Brien.*

NOTES ON THE CULTIVATED PLANTS OF THE REPUBLIC OF SALVADOR.

(*Continued from p.* 101.)

Nymphaea ampla, the only native Water Lily of Salvador, is a white flowered species which occurs in a few of the lakes. Malvaviscus arboreus, so often seen in hothouses, is a common native shrub, but in its native state it is not a showy plant. One species of Fuchsia (F. parviflora) grows as a low shrub upon the higher volcanoes. Its flowers are small and inconspicuous, but the fruit is sweet and of pleasant flavour. Plumeria acutifolia and P. rubra are frequent and prominent trees or shrubs that deserve mention. Their white, red, or variegated corollas are used for stringing garlands, which are employed for decorations upon altars and in homes, especially on the Day of the Cross—the third of May—which might well be called a festival of flowers. Upon this occasion it is the custom to erect in every home a cross which is decorated elaborately, especially with flowers and greenery. In preparation for the celebration flowers are brought from the country into the markets in vast quantities, so that it is possible to form a good idea of both the cultivated and wild kinds.

A noteworthy Salvadorean plant is Ipomoea arborescens, a tree Morning Glory, as large as an Apple tree, with smooth white bark and clusters of pure white flowers. The common Lantana (L. Camara) abounds in hedges and thickets, and in its wild state is of little beauty, although there are sometimes seen forms which have handsome Cherry-red blossoms that are sufficiently conspicuous to attract attention. Petrea arborea, of the same family, is an unusual vine which makes a fine display in cultivation, with its long racemes of blue flowers. Calycophyllum candidissimum is a native relative of the Mussaendas, to which it bears strong resemblance; one lobe of the calyx is expanded into a showy white blade, and during the long blossoming season the tree is an almost solid mass of white.

Hedges are generally employed in Salvador in place of fences for separating fields and enclosing property. The plants utilised for the purpose are of the most diverse kinds, and in general little attention is paid to the hedges after they have once become established. Although when first planted usually only a single kind of shrub or tree is employed, in the course of a few years they become so filled with other trees, shrubs, and coarse herbs that it is often difficult to determine what species was originally planted. There are many miles of hedges all over the country formed of an offensively armed Cactus, Pereskia autumnalis, which forms a dense growth and is often thirty feet high. The Cactus hedges are impenetrable for most animals, but they possess no other virtue, and they waste a large amount of ground, besides being dangerous to stock and to travellers along the roads. The heavy columnar trunks of another Cactus, Lemaireocereus Eichlamii, also are used, set closely side by side, to enclose dooryards and other small areas. A favourite hedge plant is a shrubby Nettle, Urera baccifera, whose hairs cause intense pain and considerable inflammation when they come in contact with the human body. Hedges of Pineapples and of a closely related plant, Bromelia Pinquin, are frequent and answer their purpose well. An endemic species of Euphorbia (E. adinophylla) is often employed, likewise Jatropha aconitifolia and J. curcas, and I have seen a particularly neat hedge, carefully trimmed, formed of Piper tuberculatum, a shrub of dense growth and lustrous, dark green foliage.

A good many exotic trees are cultivated for ornament. Two varieties of Bamboo are grown in all parts of the Republic and have become thoroughly naturalised. Their stems are utilised for many purposes, especially for the construction of the least pretentious dwellings. Casuarina equisetifolia is planted, also the Breadfruit, Artocarpus communis; the Indian rubber tree, Ficus elastica, which like its native congeners is one of the most satisfactory tropical shade trees; Magnolia grandiflora, native of the United States, of which I saw only a few individuals; Camphor and Cinnamon trees and Allspice (Pimienta officinalis); the Horseradish tree, Moringa oleifera, so abundant everywhere in tropical America; Albizzia Lebbek; Brownea coccinea, native of northern South America and of Costa Rica, with Rose-like clusters of vivid pink blossoms; Cassia Fistula; the gaudy Flame-tree, Delonix regia, which is a feature of nearly every park; the Tamarind, whose pods are used for the preparation of beverages and for flavouring ices; Parkinsonia aculeata, a spiny tree with green bark and a profusion of sulphur-yellow flowers; Eucalyptus Gunnii; and Ochroma velutina.

In the towns a common shade tree is the Australian Silk Oak, although for what reason it is chosen is hard to determine, for it affords scant shade and has no obvious merits. For shade in the Coffee plantations Leguminous trees are preferred, and those most planted in Salvador are various species of Inga. A Coffee plantation with a single kind of shade has a superior appearance, in strong contrast with those in which trees of all kinds and sizes are planted. The Inga trees bear long pods which contain an edible, juicy, white flesh about the seeds. Among the exotic trees one of the most beautiful is Eugenia malaccensis, which is of somewhat rare occurrence. It has remarkably handsome foliage, but is itself not particularly showy when in flower, for the flowers are all developed upon the inside of the crown and are not visible from without; but the petals fall upon the clean soil underneath and form the most lovely carpet of purple-pink. *Paul C. Standley, Assistant Curator, Plant Division, U.S.A. National Museum, Washington.*

(*To be concluded.*)

TREES AND SHRUBS.

PLAGIANTHUS LYALLII.

I recollect seeing this charming shrub for the first time in Kew some fifteen or sixteen years ago. It was growing against a brick wall, and was a very fine specimen indeed. I saw it again some years later, but it had suffered very much in the interval and showed no signs of flower.

On first seeing it I ordered a plant, which has grown in my gardens ever since; it has not a few times been cut to the ground by severe winters, but has always sprouted up again. By some oversight it was not planted against a wall, and though I saw its green leaves year after year, I had given up all hope of its flowering until a few days ago I was attracted by quite a wealth of its charming, white, Cherry-like flowers, and these were especially numerous at the back, where it was flanked by a high Yew hedge, on which side the bush could not get by any chance a ray of the sun from one year's end till the other. I cannot account for its blooming this year, as last season was cold and wet, whilst the earlier part of this so-called summer was one of the worst in my recollection. Certain it is, if it requires the protection of a wall it is not for warmth nor to ripen the wood, as my plant amply demonstrates.

The soil must be very poor, as the Yew roots of the adjoining hedge are very greedy, whilst the plant likes a rich loamy soil. P. Lyallii is a native of New Zealand, where it grows some thirty feet high, whilst with me in Renfrewsire it is only some ten to twelve feet. *Formakin.*

THE AVONDALE FORESTRY STATION.

(*Concluded from p.* 104.)

Of the Spruces only two species have turned out satisfactorily, Sitka Spruce and the ordinary European variety. In the plot containing the former species the trees were mixed with an equal number of Japanese Larch and planted at four feet apart, but suffered badly during the first five or six years from spring frosts. The general result of these frosts was that the Japanese Larch slowly gained on the Spruce, many of the latter being stunted and checked in their growth. In 1917 the Sitka Spruce were considered past recovery, many of them being completely leaderless, and resembling bushes rather than trees. The idea was favoured of growing a mixed crop of Larch and Spruce, side pruning or removing the former in places where the Spruce were most promising, and allowing the latter to die out in the least flourishing parts. The result of this thinning and pruning was so striking, however, that it was gradually extended from year to year, the Spruce recovering in the most remarkable manner, as soon as light had been admitted. In the third year after thinning, normal leaders two to three feet long were being made. The quantity of Larch removed from this plot, consisting of two acres, has been 1,754 poles, containing 2,373 cubic feet. These figures show that a mixture of Japanese Larch and Sitka Spruce can, under favourable circumstances, prove extremely profitable. The Sitka Spruce, while not being a good shade bearer, is possessed of extraordinary powers of recovery, after being to all appearance entirely suppressed.

Of all species common Spruce has produced the most uniform crops, and as this tree has gradually changed its function of a nurse tree into a main crop, four or five sample plots in excellent condition are present. The best growth has been made on sandy loam near the river Avonmore. This plot consisted of three-fourths common Spruce, and one-fourth Colorado Douglas Fir, but the latter are entirely suppressed. The planting distance was 3½ feet, or 889 Douglas Fir and 2,667 Spruce to the acre, practically equal to a planting distance of four feet for the latter. The Spruce has reached a height of 35 to 40 feet, with a volume of 1,200 cubic feet per acre.

Amongst the Pines the greatest growth has been made by Pinus insignis, which is now 40 to 50 feet high, with a quarter girth measurement of six to ten inches, but the crop is very irregular owing to planting failures. Corsican Pine has proved the most satisfactory crop as regards regularity, form of stem, and rate of growth, being 20 to 30 feet in height, with a quarter girth of three to five inches.

Of the various Larches planted, only two are satisfactory, Japanese and European. A pure crop of the former originally planted with Banks Pine in equal numbers at four feet apart, the latter dying out at an early age, now contains 820 cubic feet on half an acre, and a height of 30 to 35 feet. This plot has not been thinned, and the 681 stems still present are remarkably uniform in size throughout, having an average quarter girth of 3¾ inches. No tree can be regarded as suppressed, and the fact that the original number planted is still on the ground shows that a planting distance of about six feet is the most economical for this particular species. European Larch has done well wherever planted, although canker has been prevalent, and in some plots every tree is affected. In common with the experience gained in most parts of the British Isles, thinning has had a marked effect in promoting recovery from this disease.

Oregon Douglas Fir in a plot of about two acres was planted with common Larch in a low-lying situation, and suffered severely between 1905 and 1911 from spring frost. The Douglas Fir were put in at seven feet apart and filled in with Larch to 3½ feet. Between frost and canker the Larch either died out or became suppressed at an early age, leaving the Douglas Fir with no other competitors than neighbours of their own species. This would probably have been satisfactory had spring frost not disfigured the tops of the trees to such an extent that all vestige of a leading shoot was often destroyed for a year or two, and forked and crooked stems resulted. A further trouble originated in the soft and rapid growth resulting from the sheltered situation, and preventing the straightening of the shoots in late summer and autumn. The combined results of these several disadvantages have been that the crop is of a rougher character than would have been the case under more favourable circumstances. As time goes on, however, there is every probability that the trees will improve in form, and that the timber will be clean enough to satisfy all reasonable requirements. *A. Henry.*

HARDY FRUIT GARDEN.

POLLINATION OF CHERRY, APPLE AND PEAR BLOSSOM.

CHERRY.

Most varieties of Cherries are generally in bloom together for a certain time, and it will be found that the early varieties usually commence to blossom very gradually, whilst the mid-season sorts come into bloom more rapidly, and the late varieties most rapidly of all. It is very important in Cherry orchards that the varieties which have been found to pollinate one another should be planted in close proximity, and it has been found that amongst others the following form good crosses, namely :—Waterloo with Amber Bigarreau, Early Rivers with Turk, Early Rivers with Knight's Black, and Governor Wood with Amber Bigarreau.

APPLE.

In the case of the Apple, where five stigmas are found to overtop the stamens, the stigmas, as a rule, mature before the anthers. In some varieties self-pollination takes place to a limited degree, owing to pollen falling upon the stigmas when the flowers bend sideways towards the light. Cross-pollination, however, is absolutely essential to ensure fruit of high quality, and there is little doubt but that it is beneficial and a factor likely to induce much larger crops in all cases.

For really effective cross-pollination between any two varieties of Apple, the time of flowering should overlap. During recent years commercial growers especially have come to favour large plantations of one variety of Apple, with the result that they have found the cropping very irregular. It is inadvisable to plant more than four rows of any one variety without providing one or two rows of another variety which will be in flower at the right time to provide pollen for cross-pollination purposes.

In the case of plantations where it is not advisable or possible to plant fresh trees, much may be done by top working the trees in every fourth or fifth row with scions from some variety which has been proved to be capable of acting as a suitable pollinator.

There is a great difference in the time of flowering of some varieties of Apples, and it would, for example, be quite useless to plant Royal Jubilee, which is a very late bloomer, to fertilise early flowering varieties, such as Irish Peach, Beauty of Bath, Cox's Orange Pippin, or Stirling Castle.

Few varieties of Apples are entirely self-sterile, but under this heading one must include William Crump and Edward VII.

The large culinary variety, Rev. W. Wilks, has set very heavy crops with its own pollen in my garden.

The idea which is somewhat prevalent that wind plays an important part in the pollination of Apples and Pears is totally incorrect.

PEAR.

In the case of Pears, the stamens are considerably longer than the styles, and when the flowers open the ripe stamens remain curled inwards, whilst the stigmas are ripe and ready for pollination. It therefore follows that cross-pollination by insects is of the very utmost importance. It is advisable to plant varieties which are in flower approximately at the same time in order that insects may carry the pollen from one tree to another. In the case of Pears, the weather is really the main deciding factor as to whether the subsequent crop is likely to be heavy or light. The following Pears include a few of the best varieties, and show those which would readily cross with one another.

Beurré d'Amanlis (early) with Louise Bonne of Jersey (mid-season). Williams' Bon Chrêtien (early), with Beurré Hardy (mid-season), or with Pitmaston Duchess (late). Fondante d'Automne (early) with the late Catillac. Conference (mid-season), with Verulam (late). Marie Louise (mid-season), with Winter Nelis (late).

In the orchard adjoining my garden, Duchesse d'Angoulême flowers earlier than in many places, and is responsible for fertilising Williams' Bon Chrêtien, with the result that very heavy crops are obtained year after year. *Enthusiast*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante, pp. 71-76.)

(*Continued from page* 107.)

ENGLAND, E.

Norfolk.—The fruit crops in general are poor. Sudden extremes of temperature during spring, including cold, harsh winds at the blossoming period, must be held mostly responsible for the present deficiency. Later, severe attacks of caterpillar and aphis, in conjunction with the prevailing drought, weakened and stunted growth to an alarming degree. All small fruits and even Strawberries were also much affected by these conditions. Our soil is of a light, sandy texture, with a chalky and gravelly subsoil. *David McIntosh, Easton Hall Gardens, Thetford.*

——This is a lean year for fruits. The trees, with the exception of Pears, flowered well, but the long-continued spell of cold, sunless weather, with many frosts, even until the end of June, were disastrous. Plums and Cherries failed to stone satisfactorily. It is really surprising that Apples withstood such an amount of cold. The only varieties which suffered were Allington Pippin, King of the Pippins, Newton Wonder and Peasgood's Nonesuch. Insects have been very troublesome, notwithstanding continued spraying. Our soil is very light, with a non-binding gravel subsoil. *Isaiah Johnson, Catton House Gardens, Norwich.*

Suffolk.—The prospect for fruit-growers this year is very disappointing. All kinds of fruit trees blossomed freely, but the combined effects of frost, aphis and drought have practically cleared the trees of fruit. The Apple crop is the only redeeming feature. A few varieties, such as Lord Grosvenor, Warner's King, Lane's Prince Albert, and Bramley's Seedling carry a sprinkling of fruit. *E. G. Creek, County Education Office, Shire Hall, Bury St. Edmunds.*

MIDLAND COUNTIES.

Bedfordshire.—The fruit crops are amongst the worst on record. Aphis and in fact all kinds of pests have been most troublesome, in spite of constant spraying. Pears of every variety are a failure, as also are Apricots, the latter being damaged by the bad weather in early March. Peaches and Nectarines both promise well, also outdoor Figs. Red Currants, Raspberries and Gooseberries are excellent, but Black Currants "ran off" badly. Royal Sovereign and The Duke Strawberries were splendid. Admiral and Laxton's Latest promised well, but needed rain. Apples of all varieties promise well. The hail-storm in April pitted some fruits on the exposed side, but there will be plenty to give us a good crop. Wall Plums are fairly satisfactory, but trees in the open are not very promising. The season is a fortnight late. *W. G. Warner, Chicksands Priory, Shefford.*

——Alternate years here usually give us a bumper crop of Apples, and we should have had a good crop this year, for there was plenty of bloom, but adverse conditions have ruined the prospects. Plums are a failure, and I recently saw Plum trees in several small gardens with scarcely a fruit on them. The first half at least of 1923 will long be remembered by gardeners for its lack of early warm rains, cold, drying winds, and its many practically sunless weeks. *Chas. Turner, Ampthill Park Gardens, Ampthill.*

Buckinghamshire.—It is a most disappointing season for fruit in general, and even in sheltered positions the trees are carrying exceptionally light crops. The spring frosts were so severe that three parts of the blossom was destroyed whilst in the "bud" state. Trees of all descriptions are badly blighted, whole orchards having the appearance of having been swept as by fire; much of the wood has been killed outright, and in the case of Gooseberries and Currants many of the bushes are already quite dead. Our soil is a heavy, retentive loam, resting on clay, and the natural drainage is bad. *W. Hedley Warren, Aston Clinton Gardens, Aylesbury.*

——The Aylesbury Vale Prune Damson crop is a failure, and the prospects of the other fruit crops in this county are poor. Serious damage was done by frosts and cold winds during May and June, whilst moisture and sunshine were noticeably absent until the end of June. Insect pests have done considerable damage to fruit trees, also the fruit, but the recent heavy rains have cleansed the fruit and greatly benefited the trees. There was very little blossom on Pear trees, and the crop of Pears is almost nil. Gooseberries were, in some cases, plentiful, but in exposed positions the crop was much reduced by frosts. Of Apples there are fair crops, although some damage has been done by Apple aphis. *Philip Mann, Education Sub-Office, Aylesbury.*

——With the exception of bush fruits, the fruit crops here are only moderate. The inclement weather in the early spring—a succession of hailstorms and frosts, when Pears and Plums were in flower—had disastrous effects on what appeared to be normal crops of these fruits. Strawberries also were badly damaged by severe late frosts. The soil here is a heavy loam resting on clay. *F. Reid, Dropmore Gardens, Maidenhead.*

——The fruit crops this year will long be remembered in this district as one of the worst ever recorded. Apple, Plum, and Pear trees flowered profusely, but the climatic conditions were much against development of the fruit in its early stages. Cold north-east and easterly winds checked free growth and facilitated attacks of aphis, which in many cases nearly defoliated the trees. In spite of repeated sprayings insect pests appeared to get the upper hand. Our soil is very stiff on heavy clay, and after last winter's continuous rains is practically unworkable. *G. F. Johnson, Waddesdon Gardens, Aylesbury.*

Cheshire.—The fruit crops in these gardens are a sorry spectacle. Apples, except for Lord Grosvenor and King of the Pippins, are a failure. Pear trees, with the exception of Glou Morceau, following the heavy crop of last year, failed to blossom. Plum trees never bloomed more profusely, but frost prevailed during the blooming period, and most of the fruit dropped prematurely. Denniston's Superb, The Czar and Pershore are the only varieties carrying a crop. Black Currants, Red Currants and Raspberries are blighted owing to frost at blossoming time and subsequent cold and dry winds, and carry very light crops. Gooseberries and Strawberries were the best crops of the year, but below the usual in both quantity and quality. Peaches were never more severely attacked with leaf curl, which resulted in the fruit being starved from want of nourishment. The crop, however, is sufficient to need thinning. *T. A. Summerfield, Alderley Park Gardens, Chelford.*

——The crops of Apples and Pears are patchy; here and there occur trees with full crops of both these fruits. The sunless autumn and weakness resulting from overcropping last season, together with the unfavourable weather in May, when frost occurred on twelve mornings during the month, led to these unfortunate results. A lot of Plum bloom was pollinated before the frost came. We are in a low, damp locality. *Alfred N. Jones, Marbury Gardens, Northwich.*

——Some varieties of Apples are carrying good crops of clean fruit, other varieties have not a fruit on them. Pears are practically a failure, and the same is true of Plums and Sweet Cherries. Morello Cherries are an average crop and clean. Gooseberries, Red and Black Currants and Strawberries were all very satisfactory. Raspberries were an average crop; the cold winds damaged the foliage when the canes were commencing to leaf. All trees and bushes were covered with blossom, but the cold, wet autumn of 1922 was so unfavourable for ripening the wood that good crops could hardly be expected. Early in the spring we were threatened with an attack of green-fly, but spraying with Quassia

Digitized by Google

extract killed the pest, and the foliage is now clean. Our soil is a heavy, red loam on a sub-soil of sand. *James B. Allan, Tirley Garth Gardens, Tarporley.*

——The poor fruit crops are due in a large measure to a month of wet, cold and almost sunless weather, followed by late frosts. There are a few varieties of Apples which have good crops, such as Annie Elizabeth, Gascoyne's Scarlet, Lord Suffield, Keswick Codlin and Fearn's Pippin. There are hundreds of Pear trees in this district without any fruit, and in many gardens Gooseberry bushes had not a single berry on them. *James Atkinson, Torkington Lodge Gardens, Hazel Grove, nr. Stockport.*

——The fruit crops are the most disappointing on record. There was a plentiful supply of bloom, and an early promise of satisfactory crops of most kinds of hardy fruits, but cold east winds during the first three weeks of April, followed on the 24th of that month by snow showers and eight degrees of frost—when Apples were in full bloom and Pears just set—had a most damaging effect on the crops. The trees are, in many cases, badly infested with green fly, and made but little growth until the end of June. Peaches and Nectarines in unheated houses have not set so well as on former occasions—due, I conclude, to the want of sunshine in 1922. *N. F. Barnes, Eaton Gardens, Chester.*

Derbyshire.—The fruit crops are not good. Pears are almost a failure, and Apples are much under the average crop, except a few early varieties, such as Irish Peach, Worcester Pearmain and Devonshire Quarrenden, all of which have fair crops. All later varieties of Apples are very lightly cropped. Plums, except on wall trees, are almost nil. Sweet Cherries were very poor, but Morello Cherries were a fair crop, although much under the average. Gooseberries, Raspberries and Currants were average crops, and the berries were of good quality. Strawberries were very late. The soil here is light and gravelly, with a subsoil principally of clay. *James Tully, Osmaston Manor Gardens, Ashbourne.*

(*To be continued.*)

HOME CORRESPONDENCE.

Fragrant Tulips (see p. 99).—Tulip Prince of Austria is a fragrant Tulip not mentioned by your correspondent. This Tulip is one of the best varieties for general purposes, is cheap, a good forcer, sturdy grower, popular colour, and grown extensively for market. *Fred. W. Jeffery.*

The Plague of Aphides.—Everything in these gardens has been badly affected with Aphides. Three remedies were tried, (1) nicotine, (2) Quassia extract and soft soap, and finally (3) katakilla. The first two did not seem to be effective, so I tried the last on some Red and Black Currants which had not been sprayed and were very bad; the first spraying killed the aphis. I then tried it on Red and Black Currants which had previously been sprayed with nicotine, on which the aphis were as bad as ever. Again this spraying cleared the pest. The bushes previously sprayed were a good way from the latter, so these had no chance of contaminating those sprayed with nicotine. I have since used katakilla on Plums, Pears, Cherries, Currants, Chrysanthemums, Roses and Broad Beans. All had been previously sprayed several times with nicotine and Quassia extract with the exception of the Broad Beans, but, after spraying with katakilla, I found it the most effective of all. I cannot account for the failure of the nicotine extract and Quassia, as previously I found both most effective. Both were used at full strength, and curiously the nicotine was quite effective on Peaches and Nectarines. I recommended katakilla to several people who were troubled with aphis, and they were all pleased with the results. I had been told that there was a danger of scorching with this preparation, but have failed to see any on anything that has been sprayed with it. I do not think there is any danger if one is careful not to spray when the sun is shining on the trees. Ladybirds were very late in appearing this year. *W. G. Warner, Chicksands Priory Gardens, Shefford.*

The Runner Bean.—In reference to "Notes from a South Devon Garden," by your correspondent, Mr. R. Irvin Lynch, V.M.H., Torquay (see p. 84), on the above subject, I may give my experience of growing the Runner Bean as a perennial for over forty years and with the best results. I am growing three-year-old plants this year, and I have grown them up to seven years old. The advantages claimed are (1) that the old roots produce Beans quite one month in advance of seedlings—a great point from a market point of view—and the first pods in many cases actually rest on the soil; (2) the flowers set better in a dry period, six or more Beans being fit to gather at one time from a single truss of bloom, while seedling plants are dropping their flowers wholesale; (3) I find no better material for exhibition for early shows, the pods being straight, uniform in length, and freely produced till late autumn. We usually make our last gathering about November 5. My method is to dig up the roots, just as one would lift Dahlias, and store them in the same way in a dry and frost-proof place until spring, then start them in boxes, like Dahlias, and plant them out in trenches when two or three inches of growth have been made. The plants are staked and protected with a few branches if nights are frosty. I plant at one foot apart the first year, and increase the distance to two feet as the roots grow older, because the growths increase in number each year. *C. Capp, Old Abbey Gardens, Leiston.*

——Mr. J. Irwin Lynch's statement that the tuberous roots of Runner Beans will give a crop the second season is well known in this part of Ireland, and they are grown fairly commonly in co. Dublin gardens a second season, to produce an early crop of pods; I have practised this method for some years. Like the Dahlia, in our favoured climate, the Scarlet Runner Bean needs very little protection in winter, a few inches of coal-ashes being all that is necessary, and the roots do not always get that, but I invariably find them the better for being lifted and replanted in the spring. Scarlet Emperor treated in this way, with but merely a good layer of weeds in the trench, no manure being obtainable, is now bearing profusely in my garden. *K. Dublin.*

Text-book of Forest Botany.—In his review of *An Elementary Text-book of Australian Forest Botany*, on p. 99 Professor Henry states that "no suitable text-book on forest botany for the use of students and foresters in this country has yet been published." Professor Henry has overlooked the fact that a work of this description, entitled *Trees: A Handbook of Forest Botany for the Woodlands and the Laboratory*, was produced by the late Professor Marshall Ward, of Cambridge, the fifth and concluding volume of which was published in 1809. *A. D. Richardson, Edinburgh.*

The Ornate Gentians (see p. 85).—I was much interested in Mr. Clarence Elliot's note on the Ornate Gentians, and I was wondering if there might be good and poor-growing strains of Gentiana sino-ornatus. When making the rock garden here in 1921, I put four plants, all from different sources, in a group at one end of the moraine; three of them gradually dwindled away; the fourth has grown very strongly, and is now covering about four square feet of ground. This particular plant flowered very freely last season, lasting in bloom for a very long period, and looks like doing so again this year. G. Farreri we lost, but I have tried it again. This species does not appear to be very robust at present. I was wondering if others have had a similar experience with this very beautiful Gentian. *Evan G. Jones, Shalesbrook Gardens, Forest Row, Sussex.*

SOCIETIES.

ROYAL HORTICULTURAL.

August 21.—The fortnightly meeting on Tuesday last was not largely attended, doubtless because many of the Fellows are enjoying their holidays, but the exhibition was very interesting, the various floral groups making a bright display. The principal subjects shown were Gladioli, Roses, Carnations, Dahlias, Verbenas, Phloxes, Tritomas, and miscellaneous border flowers. The number of Orchids shown was surprisingly few, probably the fewest at these meetings since the war. A few novelties were forthcoming, principally in the floral section, and of these several Dahlias were selected for trial at Wisley, whilst one new plant received a First-Class Certificate and three others Awards of Merit.

Choice indoor fruits were staged by Mr. J. A. Nix, whilst a meritorious collection of vegetables was exhibited by Messrs. Barr and Sons.

Orchid Committee.

Present: Frederick J. Hanbury, Esq., F.L.S. (in the chair), Messrs. Jas. O'Brien (hon. secretary), Gurney Wilson (assistant secretary), Arthur Dye, Fred. K. Sander, S. W. Flory, Richard G. Thwaites, W. J. Kaye, Pantia Ralli, E. R. Ashton, H. T. Pitt, and J. Cypher.

There were only two exhibits. A small selection of hybrids was shown by Messrs. Flory and Black, Slough, for which a vote of thanks was given. The collection included two good forms of Cattleya Hardyana alba; Laelio-Cattleya Glorita (C. Rex × L.-C. Thyone) with Primrose-coloured sepals and petals, and good Tyrian-purple lip with fine gold lines from the base; and Brasso-Cattleya Ida Blenheim variety (B.-C. Pluto × C. Dowiana) in colour tawny yellow, with pretty rose-veined lip having a yellow disc.

Messrs. Sanders, St. Albans, showed Cypripedium Godefroyae punctatissimum, probably the largest and best shaped C. Godefroyae. The large flowers are white with heavily blotched lines of deep claret colour, the lip being white with a few violet spots.

Floral Committee.

Present: Messrs. H. B. May (in the chair), H. J. Jones, D. B. Crane, F. J. McLeod, A. Turner, Chas. E. Pearson, W. P. Thomson, W. B. Gingell, H. R. Darlington, S. Morris, H. V. Warrender, J. B. Riding, J. Jennings, Wm. Howe, T. Stevenson, J. Heal, T. Hay, G. Reuthe, W. J. Bean, Jas. Hudson, J. W. Barr, Reginald Cory, W. G. Baker, W. Cuthbertson and Gerald Loder.

Dahlias.

The Joint Dahlia Committee, composed of the members nominated by the Royal Horticultural Society and the National Dahlia Society, met for the first time this season to consider the merits of a large number of seedlings. The following were selected for trial at Wisley next year:—

Gloria.—A very large and handsome decorative variety of rich crimson colour, flushed with maroon. It appears to be free-flowering.

Gossamer.—A large Cactus variety, made up of narrow florets of delicate pale mauve colouring, which is nearly white in the centre of the bloom.

Martin.—A shapely Cactus variety of good exhibition form, yellow in the centre and flushed on the outer florets.

Miss Edith Jones.—A very long-stemmed Cactus variety of rich yellow colour, which becomes heavily stippled with rose on the mature florets.

Periscope.—A rosy-purple Cactus variety of starlike form and borne on long stems.

Doris Trayler.—A beautiful decorative Dahlia of large size, borne on long stems and of rich velvety-crimson colour, heavily flushed with maroon.

A. E. Amos.—A pretty Cactus Dahlia with narrow segments; the incurving florets are of a dark coral-red colour.

John W. Woolman.—A large Cactus variety set squarely on long stems. The broad florets,

Digitized by Google

which incurve somewhat, are pale yellow when young and become lightly flushed with age. The above were shown by Messrs. J. Stredwick and Son.

Rosie.—A very beautiful miniature Paeony of shining rosy-mauve colour. As this name has already been used, the variety must be renamed.

Joyce Goddard.—A garden Cactus variety of dazzling scarlet colour, with a golden base to the florets

Betty.—A valuable Pompon of good compact form and pale lilac colour.

Gold Cup.—Another very good Pompon, but of bright yellow colour. This and the three preceding varieties were shown by Messrs. Jarman and Co.

Hindhead Star.—A very decorative variety of buff-yellow colour, tipped with rose-pink. This and the following were shown by Messrs. J. Cheal and Sons.

Vesuvius.—A dazzling miniature Paeony-flowered variety of scarlet colour, heavily shaded with crimson.

Haslemere Star.—This is an improved Southern Star, but of brighter and more attractive appearance.

First-Class Certificate.

Chimaphila maculata.—Although only a few inches high, this is a very uncommon and fascinating plant. The lanceolate evergreen leaves are toothed, and when young are Pea-green, with a sparkling white band along the midrib and veins; with age the leaves darken, but are still highly decorative. The corymbs bear two or three pendulous, white, fleshy flowers of somewhat Hoya-like appearance, and delicious Hawthorn fragrance. This little evergreen was introduced from North America in 1762, and was figured in the *Bot. Mag.* as Pyrola maculata. Shown by Mr. G. Reuthe.

Awards of Merit.

Dianthus Allwoodii Clarkson Pink.—This is a delicately beautiful variety of this well-known free-flowering type, and the flowers are larger and more shapely than usual. The colour is a soft pale pink. Shown by Mr. G. Miller.

Montbretia Cecil.—A very good yellow-flowered variety which has plenty of substance in the petals. The flowers are of rather more than medium size and well disposed on the spike. Shown by Mr. S. Morris.

Rose America.—As the name suggests, this is of transatlantic origin. It is a very fine, shapely H.T. Rose, well filled with large substantial petals, and borne on long, erect stalks. The colour is a pleasing pink, darker in the centre of the blooms, which have a delicious fragrance. Shown by Mr. Elisha J. Hicks.

Other Novelties.

Besides the above, which received awards, there were several very interesting novelties. Rudbeckia purpurea elegans, shown by Mr. Amos Perry, is a distinct improvement on the species. The petals are broader, of richer colour and better disposed around the disc. Lonicera Hildebrandtiana was represented by several branches bearing long, yellow flowers. This was sent by Mr. M. Hodden, West Porlock, Somerset, and appeared to have been grown out-of-doors. Mr. Hodden also showed flowers of the uncommon Bomarea multiflora. Buddleia variabilis var. narhoensis was again submitted to the Committee, and this time by Mr. Lawrenson, Newcastle, who also showed Origanum vulgare. Mr. Charles Turner sent excellent branches of Erythronia crista-galli well furnished with large, coral-red, Pea-shaped flowers, and Clerodendron foetidum bearing heads of bloom rather larger than usual. Gladiolus Poppy, shown by Messrs. Lowe and Gibson, is a variety of striking colouring. The sparkling scarlet flowers have purple and white markings on the lower segments

Groups

Gladioli again formed a considerable portion of the floral exhibits in the hall. Messrs. R. H. Bath, Ltd., had an exceedingly attractive collection, which included large vases of Prince of Wales, White Giant, Willy Wigman, and the deep scarlet Clémenceau of the large-flowered hybrids, with many Primulinus varieties, notably Souvenir, rich yellow, and Salmon Beauty (Silver-Gilt Flora Medal).

A large collection arranged by Major Churcher attracted a deal of attention. In the centre there were artistically arranged bowls of Sedan, Alice Tiplady, Woodcote, Altair and Peronnes. On either side were smaller vases containing a large variety, of which Martha, scarlet and maroon, Montezuma, crimson and purple, and Magic, lilac flushed, were very uncommon (Silver-Gilt Banksian Medal). Messrs. Lowe and Gibson showed Gladiolus Zanthia of rich orange shade, Altair, Red Fire, of glowing colour, and St. Thomas, a new American variety of brick-red colour with rosy maroon lip (Silver Banksian Medal).

A goodly collection of commercial varieties was displayed by Mr. Alfred Edwards (Silver Flora Medal). A length of tabling was well filled by Messrs. Kelway and Son with very good spikes of such varieties as Crown Jewel, Grover Cleveland, Snowdon, Lady Rosemary Portal and Lady C. Combe (Silver Floral Medal).

An excellent collection of Montbretias was well set up by Messrs. Sutton and Sons against the wall by the entrance. They had large stands of Queen Mary, Henry VIII., Una, Carminea, Tangerine and other splendid sorts, which were associated with an enormous quantity of profusely flowered Phlox Drummondii and Verbenas; both of these annuals were shown in a wide range of lovely colours (Silver-Gilt Banksian Medal).

Roses were staged in better condition than at recent meetings. The Rev. J. H. Pemberton made good use of Vanity, Mermaid, Souvenir de Claudius Pernet, Los Angeles and many other sorts (Silver Flora Medal). Messrs. Chaplin Bros. included Isobel, Irish Fireflame, Innocence, Christine and Golden Ophelia in their collection (Silver Banksian Medal). In a smaller collection Messrs. D. Prior and Son showed F. G. Longmans, a free-flowering, pale orange-coloured variety with deep green, shining foliage (Bronze Flora Medal).

Dahlias in larger quantities than a fortnight ago foreshadowed the coming autumn. Messrs J. Cheal and Sons had a very representative collection, which included many good varieties of all types, even including the show and Fancy Dahlias. Their Novelty, a Collerette with extra ray florets of scarlet colour, and small straw coloured quills, is very attractive. Messrs. Carter Page and Co. had many of the highly decorative small Paeony-flowered varieties, and these included Flos, Alma, Ladybird and Olivia. They also showed a good selection of other types (Silver Flora Medal).

General border flowers were shown in seasonable variety and in quantity. Mr. M. Prichard had Montbretias, half-hardy Lobelias and other genera with a quantity of Gladioli (Silver Flora Medal). Mr. W. Wells, junr., included good varieties of Delphinium and herbaceous Phlox (Silver Banksian Medal). Mr. Amos Perry staged many double-flowered Hollyhocks, Kniphofias, Rudbeckias and Helianthus with some of his splendid hardy Ferns (Silver Banksian Medal). Messrs. Isaac House and Sons again showed their perennial Scabious (Silver Banksian Medal), while Mr. F. Gifford had good spikes of Delphiniums (Bronze Flora Medal).

In an exhibit arranged by Mr. G. Reuthe there were well-flowered branches of Eucryphia cordata and several species of Ceanothus. Mr. G. G. Whitelegg had Delphiniums, dwarf Campanulas and a few border Pinks. Mr. Klinkert sent Topiary specimens, and Messrs. L. R. Russell, Ltd., showed a good variety of Clematis, Pittosporums and other shrubs.

Greenhouse Carnations were staged by Messrs. Allwood Bros. and Mr. C. Engelmann (Silver Banksian Medals).

Fruit and Vegetable Committee.

Present: Messrs. J. Cheal (in the chair), W. Lobjoit, Geo. F. Tinley, S. B. Dicks, W. F. Giles, J. Wilson, A. Bullock, E. Neal, A. Metcalfe, F. Jordan, G. Reynolds, Ed. Beckett, W. Bates, S. V. Taylor, W. H. Divers and A. N. Rawes.

A fine, late-fruiting seedling Red Currant, sent by Messrs. Daniel Bros., who stated they had received it from a customer, was recommended for trial at Wisley. It is said to be a chance seedling, and is apparently of much merit. Messrs. Daniel Bros. also exhibited their new Black Currant named September Black, which received a First-Class Certificate in August, 1921.

A Silver-Gilt Hogg Medal was awarded to J. Nix, Esq., Tilgate, Crawley (gr. Mr. E. Neal), for a collection of Grapes, Peaches, Nectarines, Figs and Pears. The Grapes were very heavy bunches of the variety Black Hamburgh; there were in all sixteen bunches having an aggregate weight of forty pounds. The Grapes had been grown in a vinery without fire-heat since April, and the rest of the fruit had received no fire-heat at all. They included excellent Early Grosse Mignonne, Thomas River and Bellegarde Peaches, River's Early Orange Nectarines, Brown Turkey Figs and William's Bon Chrétien Pears.

Messrs. Barr and Sons showed a collection of vegetables for which a Silver-Gilt Knightian Medal was awarded. The quality was exceptionally good in this most difficult season, and the various dishes were arranged in the best exhibition style. They included most kinds in season, notably dishes of Long Purple Aubergines, Scarlet Emperor and Prize Winner Runner Beans, New Red Intermediate Carrots, Frogfield and Ailsa Craig Onions, Harbinger Cabbages, New White Marrow Parnsips, and Tall Red Celery. Beside these there were Lettuces, Beets, Cucumbers, Kohl Rabi, Marrows, Globe Artichokes and Turnips.

READING AND DISTRICT HORTICULTURAL.

Last year the Reading Gardeners' Association, the Reading Corporation Allotments' Committee and the Reading Allotment Holders' Association combined together to hold a show with the two-fold object of encouraging horticulture among the allotment holders of Reading, and to benefit the funds of the Royal Berkshire Hospital. The result was the largest competitive show held in Reading and a cheque for £195 8s. for the hospital. Following on this success it was decided to form an Association, and the show was held on Wednesday, August 11, in grounds placed at the Committee's disposal by Mr. Oliver Dixon. From a horticultural point of view, it was a magnificent success, the entries in most classes being exceedingly numerous and the quality, notwithstanding the unfavourable season, especially good. There were 106 competitors in the various classes, representing 556 entries. Among the principal prize winners in the open classes were Mr. C. E. Keyser, Aldermaston Court (gr. Mr. F. Green), who was first for a collection of 9 kinds of vegetables, first for a collection of 6 kinds of fruits, and first for both Black and White Grapes; Mr. H. Hirst Foxhill, Reading (gardener), who excelled for a miscellaneous group of foliage and flowering plants, for Plums and for 12 vases of herbaceous perennials; Major Krabbe, Calcot Grange (gr. Mr. A. W. Gower), who won five first prizes, (a) for a collection of 6 kinds of vegetables, (b) for a collection of Potatos, (c) for Runner Beans, (d) for culinary Apples, and (e) for 6 vases of herbaceous perennials. Mr. H. R. Beeton, Hammonds, Checkendon (gr. Mr. J. Wynn), also won five first prizes for a decorated dinner table, for Peas, for long Carrots, for 6 vases of garden Roses, and for a basket of flowers respectively. Mr. Keeble, Coley Park, Reading (gr. Mr. D. Turner), showed the best Onions and Peaches, and was placed second for a collection of fruit. Mr. Pretty, Elmhurst, Reading (gr. Mr. A. H. Fulker), led for Antirrhinums and Tomatos.

In the Allotment Holders' Section Mr. R. Butler, of Spring Gardens, Reading, scored a great success in winning the first prize for a collection of six kinds of vegetables in competition with ten others, his produce and staging being equal in every respect to that in the open classes. He also secured first prize for six Onions in a class of 29 entries. Mr. J. Bartlett was very successful in this section, securing first prize for a collection of Potatos,

Digitized by Google

first prizes for kidney white, kidney coloured, round coloured, and second for kidney coloured Potatos. There were 77 entries for single dishes of Potatos and 13 entries for a collection. There were also 25 entries for round Beet, 18 for Shallots, 24 for Marrows and 20 for Lettuces.

Major Lubbock, of Pangbourne (gr. Mr. J. B. Lowe), staged a magnificent non-competitive collection of Sweet Peas. The Reading University College Horticultural Department (Mr. A. J. Cobb) put up a most tastefully arranged collection of vegetables, whilst the Chalk Hill Nurseries, Ltd., Reading, occupied one end of the principal marquees with bays of Mimulus, hardy herbaceous perennials and Zonal Pelargoniums.

KING'S WALDEN BURY FLOWER SHOW.

Ideal weather favoured this annual show, which was held on August 8. On the same day new pleasure grounds were opened at King's Walden Bury, and this doubtless was partly responsible for the large number of people, about 2,000, who visited the show. The exhibits were arranged in two tents. Table decorations were again very good, there being eight tables in the open class, and six arranged with wild flowers and grasses by children. Vegetables in the cottagers' classes were very good.

Several non-competitive exhibits were shown. Messrs. Cutbush and Son put up a large miscellaneous group of plants and herbaceous flowers. Messrs. Harkness and Sons displayed a stand of Roses, and Mr. J. Thompson also showed Roses. Mr. Wheeler, Hitchin, had an effective display of Roses and Sweet Peas. Messrs. Kitchener, Hitchin, exhibited Gladioli, which were much admired. A large collection of vegetables, fruit and Sweet Peas were exhibited from King's Walden Bury Gardens.

NEWPORT AND DISTRICT GARDENERS'.

The annual meeting of this society was held on the 8th inst. Mr. J. Harris (Ffrwd Vale) presided. The officers were elected for the coming session. Mr. C. Basham, The Garth, Bassaleg, was appointed President; Mr. A. W. Davis, Woodland Park Nurseries, Chairman; Mr. J. Hopkins, Vice-Chairman; Mr. H. G. Garland, Hon. Secretary; Mr. W. Lewis, Assistant Secretary; and Mr. J. Jackson, Treasurer. After the business of the meeting was conducted, Mr. Edward Harris stated that the Rose show held on June 28, at Bron-y-gaer, in aid of the local hospital, resulted in a profit of £133 19s. 9d. in aid of the local hospital funds.

NORTHAMPTON MUNICIPAL HORTICULTURAL.

The eighth annual floral fête and exhibition of the above Society was held in Abington Park on August 7 and 8, and proved a great success. Chief interest centred in the competition for the three Wren Silver Challenge Cups, each of the value of 50 guineas. A noteworthy exhibit of vegetables was staged by Messrs. J. Carter and Co., and was awarded the Society's large Gold Medal. Messrs. Thomas Perkins and Sons, of Northampton, exhibited a grand collection of miscellaneous plants, fruits and flowers, for which a large Gold Medal was awarded. A delightful rockery was also exhibited by this firm, for which a Gold Medal was awarded. Messrs. Ellison, of West Bromwich, gained a Silver Medal for an excellent exhibit of Ferns and Cacti.

The competition in the trade class for a group of Roses, 20 ft. by 4 ft. 6 in., was very keen. Mr. A. S. Dunton, of Wolverhampton, who won the Cup last year, was again successful. Messrs. Henry Morse and Son, Eaton, Norwich, were second, and Mr. George Burch, Peterborough, third, respectively. Mr. E. W. King, Coggeshall, Essex, won the Wren Challenge Cup offered for the best exhibit of Sweet Peas. Mr. A. S. Dunton won the second prize in this class. Mr. G. Wall, of Bath, won the Cup offered for Carnations, for the third year in succession, and it now becomes his own property. Mr. C. Engelmann, Saffron Walden, followed closely, with an exhibit of much merit.

For a group of flowering and foliage plants arranged in a space of 200 square feet Mr. W. A. Holmes, Chesterfield, won the chief award with a charming exhibit. Messrs. H. E. and W. Lack, Wellingborough, gained second prize with a fine display.

In the classes for floral table decorations the first prize was won by Mr. W. Holmes; 2nd, Messrs. H. Moore and Sons, Eaton, Norwich; 3rd, Mr. T. D. Wren, Northampton (gr. Mr. A. D. Wright).

In the amateur classes Miss Elsie Curtis, Abington Park, Northampton, gained two first prizes. In the class for thirty-six Roses, distinct, Messrs. Hugh Dickson, Ltd., Belfast, won the first prize easily with a grand exhibit; 2nd, Mr. George Burch; 3rd, Messrs. Peach and Stone, Newport Pagnell. For eighteen Roses, distinct, Messrs. Hugh Dickson, Ltd., again excelled, with Mr. Burch again second, and this order was maintained in the class for twelve Roses, distinct. For twelve vases of Sweet Peas Capt. R. B. Brassey, Cottesbrook Hall (gr. Mr. J. G. Quinn), was placed first. Hardy perennials were best shown by Messrs. Thomas Perkins and Sons, Northampton; 2nd, Messrs. Peach and Stone. Capt. R. B. Brassey won the chief prizes in the fruit classes, and he also won the Bostock Challenge Cup for a collection of vegetables, in which Mr. C. Kitchener, Olney, was second.

ROYAL CALEDONIAN HORTICULTURAL.

August 7.—The ordinary monthly meeting of this society was held at 5, St. Andrew's Square, Edinburgh, on this date, Mr. W. G. Pirie, Vice-President, in the chair. A paper on "Some of the Scarcer Alpines," by Mr. William Austin, Comely Bank Nursery, Edinburgh, was read by the Secretary. Mr. Austin dealt with alpines which are quite hardy, chiefly with the newer Rhododendrons and Primulas, and his remarks in the main consisted of cultural and other details necessary for their successful growth.

The exhibits consisted of a collection of Begonias, Gloxinias, Pelargoniums and Carnations from Messrs. Dobbie and Co., Ltd. (awarded a Gold Medal); Dianthus Napoleon III., from Mr. W. Lamont, Edinburgh, and an unnamed hybrid Gooseberry from Mr. Coventry.

REPLY.

In reply to the query by *J. E.* on p. 78 I may say that about Hereford, this year, there has been an unusual prevalence of Trifolium minus, the small yellow Clover, both on lawns and pasture. In some places the former, where not closely mown, were quite yellow with the blossoms. As it seemed possible that a good dressing of sulphate of ammonia might do good, I was interested in a large, full-sized croquet lawn which was to have had this dressing, but, as only half was to be used for lawn tennis, a "double dose" of the sulphate (about 2 oz. per sq. yd.) had been given to this half; the contrast was very distinct, for the treated half showed hardly a Clover plant, whilst the other was distinctly yellow. Hereabouts, there is no difficulty in getting Clover to come up; one dressing of basic slag has brought to the fore any number of Clover plants without any seed being scattered. It is not unlikely that *J. E.* may maintain his Clover by this means. I lately assisted in dressing a lawn in Guernsey in which objectionable patches of T. repens had appeared, but it is too early to report any result at present. It may be added that, before the dressing was applied, the Clover patches were well raked up repeatedly, and the mower was run over the lawn in order to remove as much of the Clover as possible. *H. E. D.*

ANSWERS TO CORRESPONDENTS.

Begonias Dropping Their Buds and Leaves: *J. B. W.* Without knowing all the circumstances it is difficult to understand why your Begonias should drop their flowers and buds, but it is no doubt due to some cultural error. You state that in some plants the stout stems rot off; this points to their being kept in a close, moist atmosphere, and such conditions would account for the flowers and buds falling. During the summer months Begonias enjoy plenty of air, and certainly do not require a heated house. Dryness at the roots would also cause the flowers to fall. We assume you refer to tuberous-rooted Begonias, though you do not state the kind.

Caper Spurge: *Stevo.* The plant is Euphorbia Lathyris, the Caper Spurge, frequently found wild in various parts of the country, and sometimes grown in gardens for its seeds, which are pickled and used as capers. These, however, are not the true capers, the latter being the flower buds of Capparis spinosa.

Culinary Pea for Naming: *Cornubia.* The pod resembles the variety Glory of Devon in shape and colour. It is impossible for us to name varieties of Peas from a single pod, and you did not even state the height of the variety or the colour of the haulm. Glory of Devon is a pale-podded variety, with dark stems, and grows about three feet high.

Fig Tree Diseased: *C. F.* The Fig leaves and fruits are affected by the fungus Cercospora Bolleana. All diseased leaves and fruits should be collected and burnt. If the trees are sprayed with diluted Bordeaux mixture, it will help to check the disease, but in very bad cases the best thing to do is to root up and burn the trees and plant clean stock in fresh soil.

Gardeners' Hours: *W. H. G.* The condition of your employment as regards overtime is governed by the terms of your engagement. It is customary for gardeners sometimes to work overtime, as this is necessary on certain occasions when work is pressing, but it is usual to make compensation for such extra time. With regard to bothy duties, these should also be agreed to at the time of the engagement. If a head gardener insists on a member of his staff working overtime, there is no other course but to conform to his wishes or seek other employment.

Grapes Shrivelled: *F. T. S.* The Grapes reached us in a very bad condition, most of the berries being mildewed, due doubtless to the very hot weather. The brown, shrivelled condition of the stalks of the fruits suggests shanking, but the condition of the berries may be due to insufficiency of moisture in the border last autumn, and in the spring when growth was active. Examine the border to ascertain its condition of moisture, and take care not to keep the roots too dry in the resting season.

Horse Radish, Trees, and Flowers: *M. O. O. Hastings.* (1) Horse Radish may be exterminated by trenching the ground 2 feet deep or more and patiently picking out all the roots. Any pieces that spring up the following year should be allowed to grow until the crops have been gathered, when they can be dug out. We have found no difficulty in getting rid of Horse Radish where the ground is not occupied by trees or shrubs. (2) Trees that thrive in chalk soil are Pyrus Aria, P. latifolia, P. Aucuparia, Green, Copper, and Purple Beeches, Acer Pseudoplatanus, A. campestre, Ulmus stricta (Cornish Elm), U. stricta Wheatleyi (Jersey Elm), Prunus Avium (Wild Cherry), and Pinus sylvestris (Scotch Pine). (3) Herbaceous plants for chalk are Galega Hartlandii, Coronilla varia, Gypsophila paniculata, Lychnis coronaria, L. chalcedonica, Geum Mrs. Bradshaw, Anchusa italica, Dropmore var., Chrysanthemum maximum Mayfield Giant, Anthemis tinctoria

Digitized by Google

or any variety of it, Aquilegias, most Campanulas, such as C. persicifolia and varieties, and Gaillardias. Suitable rock plants are Alyssum saxatile, dwarf Campanulas, Helianthemums, Arabis albida, various Cerastiums, Hypericums, Iberis, Tunica Saxifraga, Nepeta Mussinii, Thymus Serpyllum, etc. (4) Cow, horse, pig, and hop manure, as well as all rotted garden weeds and rotted leaves that will supply humus and hold moisture in summer are suitable. (5) There are two places of the name of Newmarket, and there does not seem to be a nurseryman of importance at either. Herbaceous plants could be obtained from Messrs. R. H. Bath, Ltd., Wisbech, Cambridgeshire; and trees from Mr. R. C. Notcutt, Woodbridge, Suffolk. A nearer firm, perhaps, is Mr. G. Willers, Trumpington Road, Cambridge. (6) If you trench the garden soil 2 feet deep, you will have little difficulty in growing bulbs or any of the above plants. Keep the best or darkest-coloured soil on the top, and work strawy manure in the bottom spit to keep the soil there open

Moss on Lawns: *T. T.* The moss sent is one of the hair mosses, namely, Polytrichum juniperinum. It thrives in damp soils, shady situations, and such as are sour through water remaining upon them for a long time after heavy rain, especially in winter. Peaty soils are also favourable to it, and that means the soil is sour, and perhaps poor in plant food. If water is inclined to stand upon any part of the lawns it would be well to put in some drains, consisting of earthenware pipes of narrow bore, and only twelve inches deep. The rest consists in feeding the grass with top-dressings of good soil. Winter is the most convenient time to do this, when lawns are not being much used. Sift some old potting soil or anything similarly good and rich. To every barrow load of the sifted soil add a six-inch potful of newly slaked lime, and a four-inch potful of superphosphate of lime. About a gallon of old, well-rotted manure to every barrow load of soil would greatly improve it. A light dressing of this material could be given in November and another at the beginning of March. In the meantime the grass might be stimulated now with a dressing of lawn sand, and another light one a month later.

Mulberry: *T. R.* The Mulberry belongs to the Natural Order Rosaceae. The flowers form an aggregation on the common torus, so that each pip is a distinct fruit. In the Pineapple and the Mulberry the leaves of the flowers and the entire inflorescence become fleshy, and form what is known as a collective fruit.

Names of Plants: *R. R.* 1, Cupressus pisifera var. plumosa; 2, Cimicifuga simplex; 3, too withered to identify; 4, Sequoia gigantea; 5, Cedrus Deodara; 6, Cupressus Lawsoniana; 7, Galega officinalis var. *W. D. and S.* 1, Geranium pratense; 2, Stachys germanica. *P. A. H.* We cannot undertake to name florists' flowers. *A. J. D.* Dierama pulcherrimum. *K. F. F.* 1, Coronilla Emerus; 2, Leycesteria formosa; 3, Spiraea canescens; 4, Chrysanthemum Parthenium. *A. S. R.* 1, Sedum album; 2, S. reflexum; 3, S. rupestre; 4, S. roseum. *A. B. H.* 1, Anemone pennsylvanica; 2, Sisyrinchium iridifolium (yellow); 3, appears to be a strong form of S. grandiflorum, or hybrid of it, but would like more information as to its origin. *T. W.* Polygonum aviculare (annual).

Tomatos Withering: *J. B.* The shrivelling of your Tomato fruits points to the plant being unable to obtain sufficient moisture to counteract that lost by transpiration. The primary cause of the trouble is not to be found in the fruit itself, but in the plant. It is probable that root action is exceptionally poor as the result of unsuitable soil conditions or some disease.

MARKETS.

COVENT GARDEN, Tuesday, August 21, 1923.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.

POT PLANTS.

Remarks.—Many stands in this department are empty, which is not unusual for August. The most attractive of the white, pink and bronze Chrysanthemums are in 24 and 32-sized pots. White Heather in 48's and 60-sized pots are also a good decorative line, and find a ready sale. Some fine plants of coloured Crotons are also on sale, in addition to other foliage plants.

CUT FLOWERS.

Remarks.—Similar conditions prevail in this department as those given last week. Some of the outdoor blooms, and especially Asters and Sweet Peas, are showing the effects of the dry weather of the past few weeks. At present the supplies are equal to the moderate demand. The present weather appears most suitable for Statices, of which the supplies continue to be heavy. They include S. sinuata in blue, mauve, pink, white and yellow colours; S. latifolia and S. incana. Lilium longiflorum and white and pink L. lancifolium maintain a moderate price. Carnations are not to be recommended, the majority being very inferior in quality, and until the new crop commences they will not be much in demand. A few blooms of the best quality find a ready sale. Several sorts of Roses are arriving in a very unsatisfactory condition, and vary in price from 6d. per dozen to 2s. 6d. per dozen. Chrysanthemums are becoming more attractive; some good quality blooms of Sanctity, Countess (white), Mercedes (yellow), also some medium-sized bronze blooms, and a few bunches of spray bronze are available. Of foliage, with the exception of Maidenhair, there is a plentiful supply. Smilax from Guernsey in particular greatly exceeds the demand.

GARDENING APPOINTMENTS.

Mr. D. Crombie, for the past four years and three months Gardener to E. R. Moxey, Esq., West Court, Finchampstead, Berkshire, and late Gardener to F. Rendle, Esq., The Grange, Ascot, Berkshire, as Gardener and Bailiff to J. H. Walker, Esq., Great Martins, Sherlock Row, Twyford, Berkshire.

Mr. R. L. Bowering, for the past four years Foreman to Mrs. Walker Munro, Rhinefield House, Brockenhurst, as Gardener to F. B. Rendle, Esq., The Grange, Ascot, Berkshire. (Thanks for 2s. for R.G.O.F. Box.—Eds.)

SCHEDULES RECEIVED.

Sheffield Chrysanthemum Society.—Thirty-sixth annual show, to be held in the Artillery Drill Hall, Edmund Road, Sheffield, on Friday and Saturday, November 9 and 10.—Secretary, Mr. F. B. Hyde, 42, City Road, Sheffield.

Birmingham Chrysanthemum Society.—Fifty-ninth Annual Show, to be held in Bingley Hall, on Tuesday, Wednesday and Thursday, November 6, 7, and 8, 1923.—Secretary, Mr. A. Noakes, 148, Bristol Street, Birmingham.

Metropolitan Vegetable and Flower Show.—Annual show, to be held in the Royal Horticultural Hall, Vincent Square, Westminster, on September 7 and 8.—Secretary, Mr. R. Sudell, 124, Walworth Road, S.E.17.

Derbyshire Gardeners' Association.—Sixteenth annual exhibition of Chrysanthemums, etc., at the Drill Hall, Derby, on Friday and Saturday, November 9 and 10.—Secretary, Mr. C. W. Flanders, 45, Powell Street, Derby.

CATALOGUES RECEIVED.

J. R. Pearson and Sons, Ltd., The Nurseries, Lowdham, Notts.—Bulbs and Garden Sundries.

Leighton, 36, Renfield Street, Glasgow.—Bulbs, Forcing Plants, Trees and Shrubs, etc.

Wm. Paul and Son, Waltham Cross.—Bulbs, Camellias, Spring-flowering Plants.

W. Smith & Son, Ltd., Aberdeen.—Bulbs.

T. Smith, Daisy Hill Nursery, Newry.—Bulbs, etc.

A. Dawkins, 408, King's Road, Chelsea, S.W.10.—Bulbs.

Cooper, Taber and Co., 90 and 92, Southwark Street, S.E.—Bulbs (wholesale).

James Carter and Co., Raynes Park.—Bulbs and Lawn Grasses.

Stewart and Co., 13, South St. Andrew Street, Edinburgh.—Bulbs.

Foreign.

John B. Vanderschoot, Hillegom, Holland.—Bulbs.

The Manuring of Fruit Crops.

Systematic investigation of the system of manuring most calculated to evoke large yields of fruit is, of necessity, difficult and tedious. Experiments, to be of use, must be carried on for a number of years—in the case of top fruit for many years—and must be so planned that when results are obtained those results may be of general application. The need for such investigations is manifest. Previous attempts made both in this country and abroad to ascertain the proper manurial treatment of different kinds of fruits have led to conclusions which are by no means concordant. Nor are the conclusions reached by practical experience much more definite. Growers who practise manuring of fruits are probably agreed that bush and small fruits generally should be treated liberally, and that top fruits should be manured sparingly. They are also probably agreed that liberal dressings of quick-acting nitrogenous manures are more likely to provoke rapid and soft vegetative growth than to induce increased yields of fruit. Here and there men of long experience and of inquiring mind have worked out methods of manuring which give excellent results, but even so the question remains whether these methods are of universal or even of general applicability. As is the case with so many horticultural problems which await solution, that of manuring fruit is by no means a simple one. Kind and variety of fruit, nature of stock on which it is grafted, physical and chemical nature of soil, mode and extent of pruning—all have to be taken into consideration before experiments likely to lead to sound conclusions may even be started. It is therefore a matter of satisfaction to know that the fruit station at Long Ashton has recently taken up this subject, and proposes to make a thorough investigation of it. It scarcely need be said that we must wait for some years before any results of importance can be obtained, and therefore those who study the first interim report of the investigations at Long Ashton* will expect no more than a few indications of the kind of results likely to be obtained when the experiments have run their course. The method of experimentation adopted at Long Ashton is one which, though it is not likely to appeal to those who expect immediate results which may be applied directly by the fruit grower, is calculated in the long run to supply the foundation on which a rational system of manuring of fruit trees may be based. The method is the old well-tried one of sand culture. Instead of introducing numerous complications due to the chemical and physical peculiarities of ordinary soil, the plants are grown in sand, to which may be added the different mineral substances that plants require. By the use of this method it is possible to supply either a complete manure or one from which one or other of the essential mineral substances required by plants is withheld. No doubt when the experiment has progressed a little the pot experiments will be supplemented by field experiments, and the value of farmyard manure will be compared with that of artificials. The most interesting of the results—none of which, of course, may be regarded as final—which have been obtained during the first year of the experiment is that which indicates that one and the same mineral substance may have different effects on the shoot and root of one and the same plant. This is the case with lime. When lime is withheld from the nutrient solution supplied to the root, the growth in length of the shoots is unimpeded—in fact, may even be greater than in plants which have received all the mineral substances they require—but on the other hand the withholding of lime results in a marked under-development of the root system. Another observation of interest concerns the extent to which leaf scorch develops according to the kind of manure applied. By withholding supplies of nitrogenous manures leaf scorch is prevented, but of course the plant so starved suffers in other respects. When the rooting medium contains no potash, scorch is at its worst. Lack of this element results also in poor growth of the shoot—plants (Apples) grown without potash making not much more than half the stem growth made by those supplied with a complete nutrient solution. And with potash, unlike the result obtained with calcium, the poorness of stem growth was not compensated by vigour of root growth—the growth of the root in a medium devoid of potash being less than that which occurred in any other of this series of experiments.

As might have been expected, plants (Apples) starved of nitrogen lost their leaves early, and this whether they had been starved of other mineral materials or only of nitrogen. The plants adequately supplied with nitrogen compounds kept their leaves longest except, curiously enough, those which lacked calcium salts. In the interests of those of our readers who may peruse this interesting report we would suggest that in further instalments the author should indicate on each occasion when he uses a serial letter to denote an experiment what special manurial treatment has been meted out to the plants referred to under that letter. This would save the reader the trouble of referring back to the key of the experiments given on an earlier page. Of experiments with other fruits there is at present but little to be said, although it is worth pointing out what is certainly confirmed by experience, that Strawberries benefit markedly by dressings of phosphatic manures and show the benefit in the season of application.

* "Pot Experiments in the Manuring of Fruit Crops," by T. Wallace. *Annual Report of the Agricultural and Horticultural Research Station, Long Ashton*, 1921.

Supplementary Coloured Illustration.—Of the two varieties of Pears depicted in the coloured plate which accompanies the present issue, probably the best known to growers is Beurré Clairgeau, for not only is this variety grown freely in gardens, but it is also extensively cultivated for market purposes on account of its handsome, showy appearance, and the freedom with which the tree crops. It was raised by a gardener of the name which it bears, in the Rue de Bastille, Nantes, and was distributed by M. de Jonghe, of Brussels. The other variety, Maréchal de Cour, is of much finer quality, and Hogg describes it in the *Fruit Manual* as one of the finest Pears in cultivation. The size and appearance are shown in the plate, for the fruit is reproduced natural size; under exceptional cultivation the fruits may grow much larger than the one illustrated, and Mr. R. D. Blackmore records a specimen weighing eighteen ounces. The season of this fine Pear is the end of October and beginning of November. Those who intend to plant Pears this autumn would do well to include a tree or two of this excellent variety, which was raised by Dr. Van Mons about 1840.

Imperial Fruit Show.—Efforts are being made to induce retail fruiterers and florists throughout the country to make a special feature of their window displays during the period in which the Imperial Fruit show will be open to the public, October 26 to November 3. Arrangements are being made for special posters to be printed and distributed to fruiterers, through local associations, pointing out that "this window is being specially dressed in connection with the Imperial Fruit Show week." So far Manchester, Rochdale, Liverpool, and the London and Home Counties area are taking steps to make this effort effective, while at Liverpool a window dressing display will be organised, but no prizes offered. We understand that the *Daily Mail* has offered two fifty-guinea gold cups to be won outright at the Imperial Fruit Show. One cup is for the best exhibit of home grown fruit, and the other for the best exhibit of Canadian grown fruit. To meet the complaint made in former years—that there were few facilities for purchasing fruit at the Imperial Fruit Show—the Committee has arranged that one extra box may be added to the number laid down for each entry in the commercial competition. These extra packages will be emptied by the judges for examination, and the contents may be sold afterwards in the exhibition hall, to the general public, either singly or by weight.

Chinese Influence in Horticulture.—The *Garden Magazine* of America is publishing an interesting series of articles by Mr. E. H. Wilson the well-known plant collector, and in the August issue of that journal some interesting historical notes are given on the influence of the Chinese on gardening. He states that we have no knowledge of the first intercourse between China and the nations of the Levant. In the first century of the Christian era Chinese armies penetrated so far westward as the Caspian Sea, and Chinese sway was maintained there for at least a couple of centuries. Probably during this period the Walnut (Juglans regia) and Vine (Vitis vinifera) were brought from that region into

Digitized by Google

China, and such fruit trees as the Peach and the Apricot carried to Persia, together with silk and other Chinese articles. The wealth of China reached the peoples of Persia and the Levant, but how much intercourse there may have been is not known. In A.D. 65 a deputation was sent to India to obtain the sacred books and authorised teachers of Buddhism which the Emperor intended to publicly introduce into China. This religion has exercised an all-powerful influence over the peoples of China, Korea, and Japan, inculcating and fostering a love for flowers. Buddha himself made famous the Bo-tree of India (Ficus religiosa), and his disciples in succeeding generations and in other lands have done the same for other trees like the Ginkgo (Ginkgo biloba), a Linden (Tilia Miqueliana), Juniperus chinensis, Thuja orientalis, such shrubs as Paeonia Moutan and such herbs as Nelumbium speciosum. From China, Buddhist apostles carried to Korea, and from Korea to Japan, a great many flowers still favourites in all three lands. Further, they introduced cereals, vegetables, and fruits, and did much to improve the material life of the people.

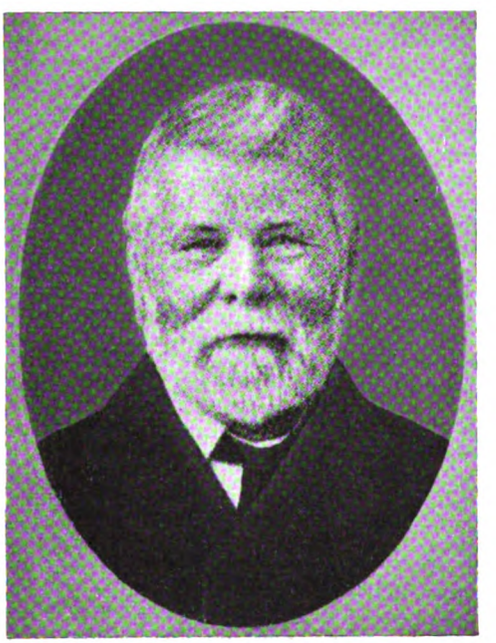
New Belgian Plant Import Regulations.—The Ministry of Agriculture and Fisheries is informed that the Belgian Government has recently issued a decree whereby the importation of Potatos, and fruits or plants of Tomatos and Aubergines, will only be allowed provided that the consignments are accompanied by official certificates of the freedom from the Colorado Beetle of the district where the produce was grown. In the case of Potatos, the certificate must also include a statement that Wart Disease does not exist within twenty kilometres of the place where the tubers were grown, and if the disease exists between five-and-twenty kilometres of that place the consignment must be examined by a Government inspector and certified as free from the disease. The Ministry is prepared to arrange for inspections where necessary, and for the issue of the certificates required by the Belgian Government. A charge of 1s. for each certificate will be made when no inspection is entailed; where inspection is necessary the charge will be at the rate of two guineas per inspector per day, with a minimum charge of one guinea.

Feltham Garden Suburb.—Feltham, in Middlesex, one of the largest outer suburbs in the west of London, has for a long number of years been intimately associated with horticultural pursuits. Readers will remember that Messrs. T. S. Ware and also Messrs. James Veitch and Sons formerly had extensive nurseries there, while at present Messrs. Watkins and Simpson have a large trial ground at Feltham, and Mr. A. W. Smith and the Messrs. Baker have extensive market gardens there. A project is now on foot to develop some two hundred and twenty acres of land as a garden suburb; this land forms part of the security of the debenture holders of Whitehead Aircraft (1917), Ltd., and the project has received the sanction of the Court. The scheme includes the erection of about 1,800 houses, in addition to shops, public buildings, and factories, but ample open spaces will be arranged for, while the old mansion at Hanworth Park, together with its surrounding formal gardens and grounds, is to be used as a club house for the residents.

Horticultural Societies in Ontario.—We gather from a recent publication*, issued by the Department of Agriculture, that there are no fewer than 1,605 horticultural societies in the favoured province of Ontario, and these are federated into the Ontario Horticultural Association, which has held an annual Convention for the past seventeen years. The total expenditure of these societies during the year 1922 amounted to $123,489, of which sum $70,046 was expended in the purchase of seeds, bulbs and plants and on civic improvements. The total membership rose from 37,357 in 1921 to 42,535 in 1922. Legislative grants are made in favour of these societies, and the total receipts under this heading came to $19,246, while municipal grants and donations came to $19,172, and the income from members' fees totalled $42,535. At the Convention held in Toronto in February of this year, interesting and instructive papers were read on: "The Planting and Care of Town and City Home Gardens"; "Nut Culture"; "Successful Cultivation of Melons, Tomatos and Asparagus"; "Cut Flower Arrangement"; "Notes on the Newer Gladiolus"; "Gladiolus primulinus Hybrids"; and "Hardy Lilies."

* *Seventeenth Annual Report of the Horticultural Societies for the Year* 1922. Ontario Department of Agriculture. Clarkson W. James, Toronto.

Mr. R. P. Brotherston.—After a period of service covering no fewer than forty-nine years, Mr. R. P. Brotherston is retiring from the management of the gardens at Tyninghame, Prestonkirk, East Lothian. Mr. Brotherston had the advantage of a training in gardens in England as well as in Scotland, but naturally served his apprenticeship on his own side of the border—at Newtown Don, Kelso, the residence of Lady Eleanor Balfour, under Mr. Thom. Lady Balfour was a keen gardener and took a great interest in the young man who was destined to become a prominent personality in the horticultural world. Later, Mr. Brotherston served for five years under that fine old gardener and florist, the late Mr. James Douglas, when the latter was in charge of the gardens at Loxford Hall. Subsequently he became head gardener in an establishment at Wimbledon, and while there was a prominent member of the famous gardeners' society which held its meetings at Wimbledon House gardens, where Mr. Ollerhead was then gardener. In 1874 our friend and coadjutor was appointed head gardener to the Earl of Haddington, at Tyninghame, where, with the encouragement and appreciative support of his noble employer, has carried out much excellent work. During his lengthy and faithful service Mr. Brotherston has greatly altered the gardens at Tyninghame, introducing many old-fashioned features, such as trim hedges, clipped trees, a covered Apple walk, grass paths, Rose and Honeysuckle walks, a herb garden and extensive herbaceous borders. The old flower garden has been altered little in design, but Mr. Brotherston has varied the planting of it from year to year and always successfully. As our readers are aware, Mr. Brotherston adds to his extensive horticultural experience a wide knowledge of horticultural books, and for this he is greatly indebted to the Earl and Countess of Haddington, whose library was ever at his disposal. We doubt whether any living gardener has had such a thoroughly pleasant horticultural career as Mr. Brotherston. He has been treated with the utmost kindness and the greatest possible consideration by his employers, and when several years ago he desired to "make way for a younger man," he was pressed to remain, and only now has he been persuaded to put off his harness; but he is to live in the village near the scene of his life's work, where he hopes to continue his interesting and pleasing literary notes and surround himself with a colony of his favourite flowers—a hope which we trust will be realised and its fulfilment enjoyed for many years to come.



MR. R. P. BROTHERSTON.

Early Floral Paintings.—In an article by Sir Arthur Evans on the excavations at Knossos, published in the *Times* on Wednesday last, he describes some of the unique paintings—dating about 1600 B.C.—which have been discovered, stating that not only are the bright colours still preserved, but the variety of naturalistic detail goes beyond anything yet brought to light among Minoan remains. Many kinds of flowering plants are represented. The Crocus is much in evidence, including clumps of Crocuses of rose colour and blue on undulating zones of orange and white respectively. Among plants which have been painted in association with variegated rocks are Madonna Lilies, Pancratium maritimum, Irises, flowering Peas or Vetches, Labiates, stellate blooms (in one case oddly combined with bell-shaped buds), flowering Sedges, Ivy and other climbing plants, and Briar Roses. Beside Olive sprays there are what appear to be egg-shaped red and yellow Plums. In one part the rocks are overgrown with wild Peas, and on the other side there climbs up a Rose bush in full bloom, by far the earliest representation of this flower. The corolla is composed of six petals of a golden-rose colour, with the centre dotted red. The rock garden appears to be complete, including the jet of a fountain, with falling spray.

The Alberta Wheat Crop.—The Wheat crop in the Canadian province of Alberta is expected to yield 143 million bushels—over double the yield of 1922. The average crop this year is 24 bushels to the acre. Arrangements are being made to export the Wheat on co-operative lines direct to Liverpool buyers.

The Baxter Exhibition.—There was much to interest the horticulturist in the exhibition of Baxter colour-prints which was held from August 14 to 23, at Messrs. Puttick and Simpson's Galleries, Leicester Square, for Baxter was a pioneer in the process of printing in "natural" colours, as opposed to the crude conventionalities of earlier work. He was born at Lewes in 1804, but he came to London in 1827, and all his work was done there. What is now known as "three colour" printing was not then known, but Baxter, building up the required colours from a steel engraving of the original painting, produced wonderfully artistic effects, in some cases by the use of twenty or thirty different wood-blocks printed one after the other. The exhibition contained some thousand plates of all kinds and sizes, most of them of a popular nature, many being used to illustrate popular music, waltzes, etc. "The Little Gardeners" is a pretty subject, showing two children gathering trails of Roses. Baxter excelled in the art of providing for his public what they required, and finding that pictures of children were in demand, he used such subjects freely. "Gathering Apples" is another illustration of this, showing a group of children with a ladder, clearing an Apple tree of its fruit, a Tudor cottage in the background completing the scene. Number 75 is a scroll of Convolvulus flowers, slightly conventional, intended as a title page for a publication called *The Artist*: and the same flowers form the subject for another title page illustration, this time for *The Agricultural Annual*, 1836. No. 73, which is a very rare print, entitled "The Conqueror of Europe," is an illustration of an Auricula for the *Horticultural Journal*, also issued in 1836. Numbers 174 and 175 are both book illustrations for *The Flower Garden and the Greenhouse*, by Charles Mackintosh. The first, entitled "Greenhouse

Digitized by Google

Perennials," shows very good reproductions of four plants—Boronia pinnata, Epacris grandiflora, Geranium (sic), and Kennedia prostrata var. rubicunda. The second, which bears the legend "Greenhouse Shrubs," illustrates Euphorbia fulgens, Hovea Celsi, Tacsonia pinnatistipula, and Erythrina Crista-galli. Numbers 184 and 537 show two examples of the same print—a group of three different varieties of Hollyhocks; the colours are not very brilliant, but the detail is good. Number 67 is a pretty little print of Claremont gardens in 1848. A "Cluster of Passion Flowers and Roses" appears in two or three exemplars, and is pleasing, though as in the case of the Hollyhocks, the colours are not sufficiently brilliant. It would appear that, although Baxter made many improvements in the inks he used, either some of them were a little fugitive, or they were applied in varying intensity in different editions, as there are very distinct differences observable where two or three examples of the same plates are shown.

Appointments for the Ensuing Week.—Sunday, September 2: Wakefield Tulip Society's meeting. Tuesday, September 4: Royal Horticultural Society's Committees meet (two days); Sevenoaks Gardeners' Chrysanthemum Society's meeting; Royal Caledonian Horticultural Society's meeting; Greenock Flower Show (two days). Wednesday, September 5: National Dahlia Society's show; Glasgow and West of Scotland Horticultural Society's show (four days); Lewes and District Horticultural Society's meeting. Thursday, September 6: Blackheath and Lewisham Horticultural Society's show; Dalry (Ayrshire) Flower Show; Manchester and North of England Orchid Society's meeting. Friday, September 7: Alloa Flower Show; Cleland Flower Show; Darvel Flower Show; Metropolitan Vegetable and Flower Show in Royal Horticultural Hall (two days). Saturday, September 8: Crieff Flower Show; Avonbridge Flower Show; Barrhead and District Flower Show; Cambuslang Flower Show; Kilburnie Flower Show; Dollar Flower Show; Gairloch Flower Show; Innerleithen and Traquair Flower Show; Milngavie Flower Show; Brentford Allotment Society's Show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Allotments.* Seeing that on all occasions you advocate the allotment system as a means whereby the poor man is benefited, perhaps a short account of Sir Edmund Filmer's allotments will not be uninteresting. His allotments are in three different parts of the parish, in all sixty allotments of a quarter of an acre each; the rent of one division is 7s., the other two are 5s. 6d. each; the rent is paid once a year, when each man receives a receipt for the same in the shape of a good dinner and two quarts of ale. Prizes are given in each division of allotments for those in the best order; the prizes are equal for each lot; it stirs up emulation amongst them, and is the means of making their gardens more profitable. A horticultural show is held, open to the allotment tenantry and cottagers of East Sutton and neighbourhood; here they all compete on equal terms; the prizes are given in all kinds of ironmongery, cooking utensils, and tools; this is an admirable plan of giving prizes, because it enables them to get some good, useful articles they otherwise would not buy, and it gives them more satisfaction, as is seen by the delight and thankfulness they show on receiving them from their kind patron and benefactor. Their show this year, which was last Wednesday, was far superior to the one last year; the prizes were very liberally given; fifty-one prizes were distributed amongst them, and some of them got some very useful and handsome presents; their prizes varied from 1s. 6d. up to 13s. each. *M. T., Gard. Chron., August 26, 1848.*

Publications Received.—*Horticultural Standards.* 1923. Obtainable from Mr. Charles Sizemore, Secretary, American Association of Nurserymen, Louisiana, Missouri. Price 25 cents.—*The Flora and Folk Lore of Shakespeare.* By F. G. Savage. E. J. Burrow and Co., Ltd., Regent House, 93, Kingsway, W.C.2. Price 7s. 6d. net.

NOTICES OF BOOKS.

Trees and Shrubs.

A VALUABLE work on trees and shrubs by Count Ernst Silva Tarouca and Dr. C. Schneider, has recently been published.* Dr. Schneider is well known to students of hardy trees and shrubs, by his *Handbuch der Laubhölz Kunde*, one of the great standard works on the subject. That is almost purely a botanical work; the new one written in association with Count Silva Tarouca is a more popular book, designed for the use of cultivators. It deals exclusively with broad-leaved trees and shrubs, and follows a similar work on Conifers. After opening essays on the use of trees and shrubs in parks and gardens, on evergreens, on those with variegated or coloured foliage and fine autumnal tints, and other subjects of general interest, a dissertation on the genera and species is given. The arrangement is alphabetical, and brief descriptions of all the more important plants are furnished. The book is most profusely illustrated, almost every page containing one or more reproductions of photographs, besides a large number of full-page coloured plates. To those who can read German this work is of particular value and interest.

* *Unsere Freiland Laubhölzer.* By Count E. S. Tarouca and Dr. C. Schneider. Holder-Pichler-Tempsky, Vienna; and F. Freytag, Leipsig.

THE ROSE GARDEN.

ROSE AMERICA.

THE beautiful new Rose named America (see Fig. 44), which received the Royal Horticultural Society's Award of Merit on the 21st ult., is a variety of first-class merit, possessing not only beauty of form and delightful colouring—glowing rose-pink—but a wonderful fragrance, a quality that many of the newer Roses lack. It was raised by Mr. E. G. Hill in the United States of America, in which country its merits have been fully recognised, for in addition to being awarded two silver medals it has received numerous prizes at flower shows in U.S.A.

FIG. 44.—ROSE AMERICA; R.H.S. AWARD OF MERIT, AUGUST 21, 1923. SHOWN BY MR. ELISHA J. HICKS.

The variety is said to bloom from May until the advent of frost. The plant makes a shapely specimen, producing clean, upright growths, and every shoot is said to produce a perfect flower. It is a seedling from Ophelia and has the same habit as its parent. Mr. Elisha J. Hicks, who is distributing the new variety in this country, is of opinion that it will become as popular as Mme. Abel Chatenay, Lady Hillingdon, and Ophelia. Although pink Roses are numerous, this novelty is quite distinct, and its beauty is enhanced by the darker colour in the centre, which is revealed as the outer petals fold back. The stems are stout and long, making the new variety suitable for market purposes, for which we predict it has a future.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

Odontoglossum crispum.—This popular Orchid and the hybrids of this section are often repotted towards the end of August, but in view of the exceptionally hot weather of the past few weeks the present time will be more suitable for the operation as the cooler conditions outside and the heavy dews at night will be favourable to the plants becoming established quickly. Plants on which the new growths have attained the length of several inches, and are about to produce new roots, should have attention first, to be followed by others as they reach the desired stage until the work is completed. Do not overpot, or it will be two seasons before the plants produce good spikes, and be careful not to break the roots. Remove the old, rootless, and leafless pseudo-bulbs. Should it be desirable to increase the stock of any of the plants from which the back pseudo-bulbs have been removed, these, if set in a box or pan, and placed on a layer of live Sphagnum moss, will soon make new growths, when they may be transferred to small pots. Every opportunity should be taken to increase the stock of all choice varieties. Work the material carefully in between the roots, and do not push all the roots to the bottom of the pots. The compost should not be pressed too firmly within the pots, as the roots are not capable of penetrating hard substances. A suitable compost consists of equal parts of peat, A1 fibre, and Sphagnum moss, with a slight addition of clean, broken leaves in the rooting medium. Thrip should be searched for and every means taken to destroy the pest when it is detected by fumigating with a suitable insecticide.

HARDY FRUIT GARDEN.

By A. J. HARTLESS, Gardener to Major J. F. HARRISON, King's Walden Bury, Hitchin, Hertfordshire.

Raspberries.—With the removal of old fruit stems, the new canes will have a better opportunity of becoming ripened. Pull out all superfluous and sappy growths, and keep the plantation free of weeds. Autumn-fruiting varieties will be now proving their usefulness. They, too, make suckers freely, a few of the stronger ones of which may be retained for planting elsewhere.

New Plantations.—It will now be necessary to consider what trees will be required for planting during the coming months, and they should be selected and orders placed with the nurserymen as soon as possible. The selection of site is an all-important factor, especially in an orchard of large size. Trees should be planted on the high ground, provided it is sheltered from cold north and east winds. The nature of the soil, too, needs careful consideration, also the natural drainage, and where this is in fault artificial drainage should be resorted to. It sometimes happens that in preparing the stations for fruit trees in advance of planting, they form water traps; and unless the soil is loosened at the bottom the trees will become subject to canker. However, the practice of planting trees above the level of the ground will tend to obviate this trouble. As time permits, preparations should be made for enclosing the ground against cattle and rabbits. The number of drainage pipes (if required), stakes for tree supports, etc., should be estimated for. If the site is on pasture, the grass should be cut as low as possible. It may be desirable to leave the grass for a year or so, breaking up the ground only where the trees are to be planted. Trees should be allowed at least six feet space free of grass, for it is now well established that grass roots are very detrimental to the growth of young fruit trees, and a cultivated area of the size advised admits of manuring and mulching the roots.

THE KITCHEN GARDEN.

By R. W. THATCHER, Gardener to MARK FIRTH, Esq., Carlton Park, Market Harborough, Leicestershire.

Winter Onions.—Make a liberal sowing of Onions in drills made one foot apart. If the ground is dry, water the drills before sowing the seed. Make the ground very firm and rake the surface finely. As soon as the young plants are through the soil, dust them in showery weather with old soot, and hoe the ground between the rows to promote healthy growth and to keep down weeds. Two good varieties for autumn sowing are Giant Red Rocca and Lemon Rocca. Onions transplanted last March should all be lifted by now, carefully dried and stored for present use. The small, silver-skinned varieties grown for pickling may be lifted and dried as advised for the others.

Rhubarb.—As soon as the foliage of Rhubarb has died down sufficiently, it may be removed and the beds given a liberal top-dressing of well-rotted manure, which should be forked into the soil next spring. This annual autumn top-dressing is essential if fine sticks are required and the plants to be kept in a strong, healthy condition

General Remarks.—The first half of the year, at least in the Midlands, has not been remarkable for any great rainfall, and the absence of sun during June has caused all vegetables to be very backward. Evaporation, therefore, was very slow, which in a way was fortunate; but seedling Beets, Carrots, Beans, etc., hardly seemed to grow at all. Since the advent of warmer weather, they have made good headway, assisted by copious waterings about twice a week, and constantly stirring the surface soil by the Dutch hoe.

PLANTS UNDER GLASS.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Veltheimia.—Plants of Veltheimia viridifolia and V. glauca that have been dried off during the summer should now be started. If in good condition at the roots, it is only necessary to give them a good watering and then remove some of the surface soil and substitute fresh compost. If it is necessary to repot them, all the old soil should be shaken away, and dead and decaying roots removed, as well as any decaying matter at the base of the bulbs. Veltheimias do quite well in any good potting compost. Like most South African bulbs, they succeed quite well in a cool greenhouse. In the case of newly repotted plants, water should be very carefully applied until they have made some top growth and a quantity of new roots. This is a good rule to observe with all newly potted bulbous plants. Where stocks do not exist, dry bulbs may be purchased at this time.

Nerines.—These bulbous plants usually commence flowering about this time, the earliest being N. Fothergillii major, and the display is kept up for some time by the later-flowering hybrids. Plants which have been kept dry for the summer should now be well watered. Unless they are in bad condition at the roots, repotting is not necessary, as they usually flower best when the pots are crowded with bulbs. If repotting is necessary, all the old soil should be shaken away, and all dead and decaying roots trimmed off. As they are usually retained in the same pots for a number of years, they should be given a rich compost, consisting of good, medium loam, mixed with a 6-inch potful of bone-meal to every bushel of soil, and sufficient clean, coarse sand to render the mixture porous. Very little water should be applied to the soil until the plants have made a quantity of new roots. Nerines only require the protection of a cold frame, or a light, airy greenhouse, during all stages of their cultivation, during autumn, winter, and spring, which is their growing period. They should be grown in a light, airy position close to the roof-glass, and must not be allowed to suffer from neglect in watering and feeding the roots.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

The Early Vinery.—After the crop is removed from the early vinery the vines are often neglected, but it is necessary to pay strict attention to details to obtain future success. Borders well filled with roots should not be allowed to become dry; indeed, occasional applications of manure, either natural or artificial, will enable the vines to store in the embryo buds material for a vigorous start next year. Superfluous laterals should be checked early, shortening the fruiting laterals gradually, in order that the basal buds may derive all possible benefit from sunlight. It is important that the foliage should be clean and free from red spider, and once the crop is cleared there should be little difficulty in eradicating this pest. If the vines are troubled with mealy bug, remove the loose bark on the spurs, and forcibly syringe the vines to dislodge the bugs. In localities where the rainfall has been heavy, with a corresponding lack of sunshine outside the borders will be wet and cold, and if they are mulched matters will be worse, therefore the mulching material should be removed, and the surface lightly pricked over to allow the warm air to penetrate the soil and reach the roots.

Vine Borders.—Vines which have failed to make satisfactory growth or finish their crop will generally be found faulty at the roots. In such cases the borders should be carefully examined to find out if the mischief occurs there. If the soil is in bad condition, and the roots unhealthy, the best plan is to renew the borders entirely. Where the roots are growing both in outside and inside borders, it is advisable to renew one border at a time, if the condition of the soil is not too serious, as there will then be less check to the vines. It is advisable to undertake this work before the foliage ripens, as there is then an inducement to the vines to throw out fresh roots to supply sap to the foliage and buds. Every possible preparation should be made to carry out the work expeditiously. Good fibrous loam of a medium texture should be chopped up roughly, mixing with it some old mortar rubble or broken plaster, wood ash, or charred garden refuse, and crushed bones. The rooting medium for vines should be so composed that water will pass freely through it, for once there is stagnation the vines will suffer. Place freshly cut turves, grass side downwards, over the drainage material. A depth of 2 feet 6 inches of soil should be allowed, and if the border is more than that depth add more drainage.

THE FLOWER GARDEN.

By C. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Border Violets.—Plants intended for blooming out-of-doors require divesting of their runners, just the same as those intended for growing in frames. If backward in growth, apply a dusting of old soot between the rows, and hoe it in—for choice in showery weather.

Rambler Roses.—The bulk of Rambler Roses have finished flowering, and the work of thinning the shoots may be commenced. The amount of pruning should be in accordance with the strength and character of the variety dealt with. Where young wood is plentiful, free thinning out and pruning may be done; in some instances every particle of old growth may be dispensed with. On the contrary, a scarcity of new shoots must, in cases where there is a large space to fill, be made good by the retention of the best of the older wood, which will give a display of bloom another year, though not equalling, of course, that from healthy young stems. On occasions the Rambler type of Rose is used to beautify rough banks or fill odd corners—in which cases the plants should be allowed to tumble about in a free and natural manner, no thinning being required beyond the removal of dead wood, a little of which naturally accumulates in the course of a few years.

PUBLIC PARKS AND GARDENS.

THE QUARRY PARK, SHREWSBURY.

THE spacious Quarry Park at Shrewsbury is well known to many gardeners, for in it is held the Shropshire Horticultural Society's Floral Fête, which this year was visited by 100,000 visitors on the second day.

Noticeable features of The Quarry are the avenues of lofty Lime trees, over 200 years old, and considered to be among the finest in Britain. Three avenues, crossing the park at various points, merge into the semi-circular avenue skirting the Severn, which, forming a loop, flows along the lower frontage of the park. The Shropshire War Memorial, the replica of a classic temple, within which is a life-size bronze figure of St. Michael, stands at the end of the central avenue, which is 400 yards long and perfectly straight. From the centre of this avenue, looking from end to end, the view is particularly impressive. On the high ground above the Severn, opposite the end of the avenue leading from Quarry Place, are the buildings of the famous Shrewsbury School.

Within The Quarry is "The Dingle," with lake, islands, and fountains. Numerous flower beds are cut out in the turf and planted with a variety of subjects which collectively produce a very gay effect. Two central circular beds are filled with fine foliaged plants, Eucalyptus, Acacia, Ricinus, Zea Mays, Agave americana, with a centre plant of Chamaerops humilis, an edging of Echeveria, and panels of blue-flowered Nemesia and Petunia. There is a red, white and blue bed planted with Dahlia Coltness Gem, a trailing blue Lobelia, and standard plants of a white and green-foliaged Fuchsia. Other combinations include pink Antirrhinums, with pink Ivy-leaved Pelargoniums, tuberous-rooted Begonias, and Dactylis glomerata variegata; Roses interplanted with Gladiolus, Lobelia cardinalis and Alyssum maritimum.

Other flower beds contain Pelargonium Paul Crampel, flowering freely, and the heat on the show days brought out the fragrance of the Heliotrope, which, as standards and bushes, is planted in quantity. In the borders above the retaining wall surrounding The Dingle Phloxes and other hardy herbaceous plants are now in their full beauty. *Fred. W. Jeffery, Dalserf, N.B.*

THE Marquis of Lincolnshire has presented to the Borough of High Wycombe three and a half acres of woodland, grotto and waterfall in Daws Hill Park, for the public enjoyment. A very large gathering of the public witnessed the ceremony when Lord Lincolnshire handed the title-deeds to the Mayor at the Town Hall on August 22. The cascade is approached by a charming pathway to be used as a public promenade. It was constructed in 1801, and the walks, pleasure grounds, and plantations were laid out by "Capability" Brown, under the direction of the Earl of Shelburne. On the same occasion as the presentation of Lord Lincolnshire's munificent gift, the historically interesting "Rye Mead," extending to about thirty acres, was transferred from the Charity Governors to the Town Council of High Wycombe.

ORCHID NOTES AND GLEANINGS.

DISAS.

(*Continued from p.* 118.)

ON p. 118 I referred to Disa grandiflora and its hybrids, also D. racemosa and D. tripetaloides. I will now deal with others in cultivation.

DISA CRASSICORNIS, LINDL. (known to many as D. Megaceras, Hook., *Bot. Mag.* t. 6,529), is one of the most desirable species to establish in gardens and one in which the possibilities in the hands of the hybridist, who has acquired such proficiency in the D. grandiflora section, are incalculable.

It is a strong grower in its own home and the small lots which have been received in Great Britain gave hope at first by flowering occasionally, but the plants ultimately died, and it is probable that the species is not now in gardens. I have seen it flowering well at Glasnevin Botanic Gardens, Dublin. I have also succeeded in flowering it, and it has bloomed in several gardens, but I think has never lived long. I have had it sent from high altitudes on the Drakensberg several times, those who collected the few plants always reporting that it was not plentiful, though very strong growing. The following extract from a letter received from the late Mr. W. Tuck, of Grahamstown, will help to show that this desirable species should be amenable to culture:—

"Disa crassicornis is a fine, handsome-leaved plant, with tall stems of fine white or cream-coloured flowers spotted inside with purple, and having curious, stout, funnel-shaped spurs. The flowers are about two inches across, and so delightfully fragrant that they may be found by the sense of smell when they cannot be readily seen for the other vegetation in the highland district where they are sparsely distributed. The hilly region where it grows is covered with snow every winter, black frosts occur, and I have seen icicles hanging about all day up there in the shade. D. crassicornis grows in the clefts of the rocks, and also in the low bush in strong red loam."

Mr. John Marshall, from his upland cattle farm on the Boschberg, when sending me three or four strong plants, also reported in the same terms, and referred to the delicate fragrance even from unseen flowers. The particulars given suggest that there should be no difficulty in growing the plant, but although I found advantage in potting them in yellow loam fibre and a little Sphagnum moss, only the strongest bloomed and then declined.

DISA ERUBESCENS, RENDLE, is a most desirable, showy species, well known from specimens collected at high altitudes (Nyassaland, 5,000 feet; Mount Ruwenzori, 6-7,000 feet). Wild specimens show that it is a strong species and about one foot in height, and bears erect spikes of five to eight flowers, which, though smaller and different in shape than those of D. grandiflora, have much of the bright colouring of that species.

Tubers of D. erubescens were sent to Kew by J. M. Purvis, Esq., and one flowered there in March, 1906. The dorsal sepal is one and a quarter inch long, rich orange, spotted with crimson. The spreading, lateral sepals are scarlet. The short petals are coloured at the tips light orange.

It does not appear that the species has been received in any other gardens, and opportunity should be taken to import it again. Although inhabiting tropical Africa, the high altitude at which it is found places it in the same class as the Cape species.

DISA LONGICORNU, LINN., a charming blue Disa, was discovered by Thunberg in 1773 high up on Table Mountain. The plant is of low growth, the tubers being furnished with bright green leaves and producing spikes of one or two handsome, lilac-blue flowers, which seem disproportionately large for the small stature of the plant.

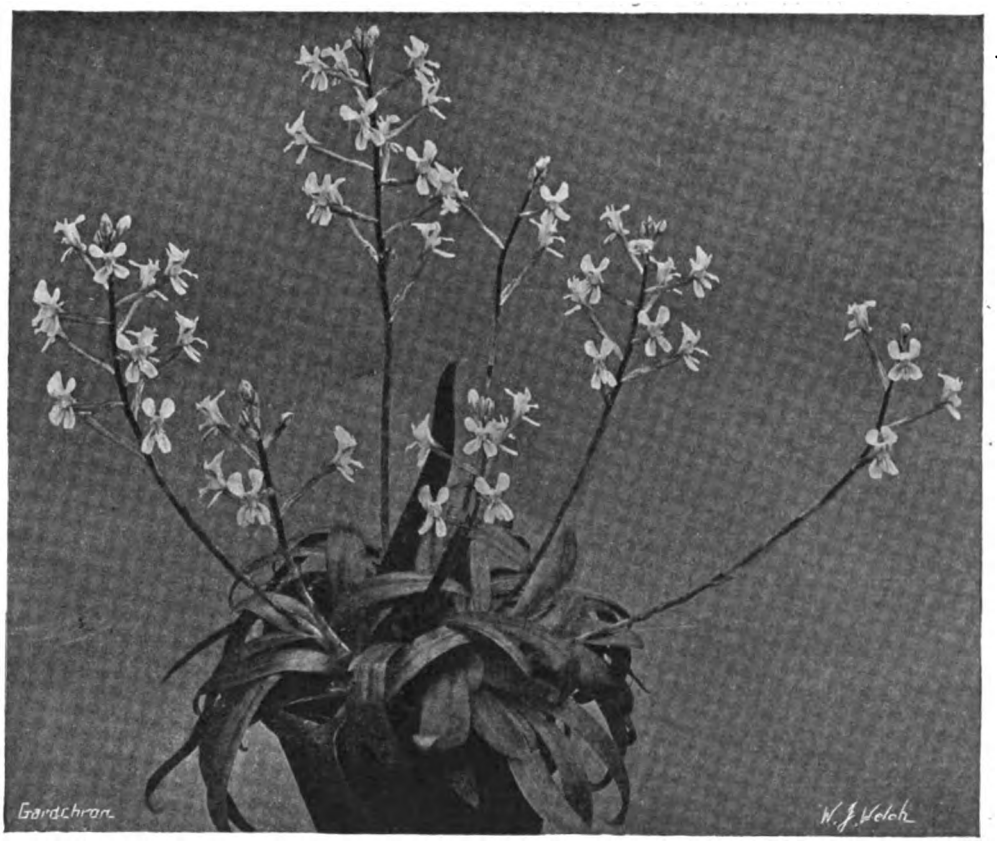

FIG 45.—DISA SAGITTALIS.

D. longicornu invariably grows in moss-covered ledges and chinks in the rocks above rivulets. It has been frequently imported, and flowered in this country.

DISA SAGITTALIS, Sw. (see Fig. 45) is a very pretty species with six-inch sprays of six to twelve pretty, pure white flowers with occasional thin lavender-blue lines. It is one of the easiest to grow, and is at present in a thriving condition in several gardens in this country.

DISA CORNUTA, Sw.—Mr. Jas. Hall, in writing of this pretty and fragrant species, stated "in habit and the production of its dense heads of flowers I would liken it to a Hyacinth, and from what I see of it in its home I should say that it would be as easy to grow as the Hyacinth."

In 1887 Mr. Smee, of Wallington, showed several plants of D. cornuta at the Royal Horticultural Society's meeting, which had been flowered in the open garden. It bloomed well at Glasnevin, producing dense spikes of pretty yellow flowers with showy, hooded, upper sepal of purple colour. It was frequently seen before 1914, but I have not seen it recently. *James O'Brien.*

MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.*

No. 20.—THE SALWEEN-IRRAWADDY DIVIDE.

AT dawn, on October 21—a sweet, clear, dewy dawn—the minimum thermometer showed 44° F. We breakfasted early, and started at 8.30 a.m., descending immediately to the torrent, a few hundred feet below, by a steep and hazardous path.

At once we found ourselves in the depth of the rain forest. For the next few hours the going was thoroughly bad. Up and down slippery, notched logs, balancing on ledges and tree trunks, scrambling over boulders and cliffs, grasping anything which presented itself—roots, lianas, rocks—we proceeded perilously. I grew accustomed to the taste of my heart in my mouth. The sweat poured from us.

Under these circumstances, since we had at all costs to go on, on, on, it was not possible to see much of the forest, beyond the fact that it was a forest. The dim light, the concentration of mind necessary to stand up and keep moving, and the roaring water alongside, all added to one's confusion of mind. It was mentally overwhelming, but it was also grand and solemn beyond belief. That one was in the rain forest, that the trees were burdened with a vast epiphytic flora, and laced together with creepers, and that the herbaceous undergrowth (notably Ferns and Urticaceae) surged waist-high, was as much as one could be certain of. Now and again I observed the clean, shining trunk of a stamineum Rhododendron (surely the series should be called Oxyphyllum?) or the large, oval leaves of a Magnolia, the fissured bark of an Oak, or the fallen fruits of a Schima or a Walnut. Occasionally a lance of sunlight split the dense canopy, and struck the nodding scarlet flowers of an Aeschynanthus or the sleek foliage of some Zingiberaceous plant. But for the most part I struggled up this remorseless yet fascinating stairway, myopic in the green haze of moss and Ferns and foliage, striped with dark tree trunks in a world of noise.

Nevertheless, we mounted rapidly. Whatever might be said in censure of the hunter's path, at least it did not deviate. It went straight up the valley, over any and every obstacle. One thing was certain—without a guide, I could never have found the way, or, more accurately, should quickly have lost it. A native accustomed to these forests could, of course, have followed the track without difficulty, by signs too refined for me to notice. But mooning along, keeping even half an eye on the wealth of vegetation, as I tried to do, was fatal. My head was in a whirl. Half a dozen times I found myself off the path, wading waist-deep through the yielding undergrowth and falling into holes, and was rescued by the men.

After four hours of this, we halted for lunch. A subtle change had come over the forest. The trees had increased greatly in size. Birch, Maple, Picea, Larix, Pseudotsuga, and large-leafed Rhododendrons had replaced the warm temperate trees of the lower forest; the Indo-Malayan element had disappeared, and the mixed forest was largely Coniferous (see Fig. 46). Calculating from the barometer reading, and correcting for temperature, we were now 3,132 feet above the Salween River. Some of the trees were gigantic, and largest of all was a species of Pseudotsuga. It is from these immense trunks that the Lutzu fashion their canoes.

We allowed an hour and a half for lunch, and then continued the ascent over a chaos of granite blocks. The forest became more open and patchy. A wilderness of shrubs lined the river and filled the open spaces. Here and there sheets of meadow intervened, with herbs 10 feet high—giant Umbellifers and Compositae, Thalictrum, Strobilanthes, and others. But the meadow was already brown and decayed. A Nemocharis yielded ripe seed—N. pardanthina I suspect, N. tricolor I hope; not that

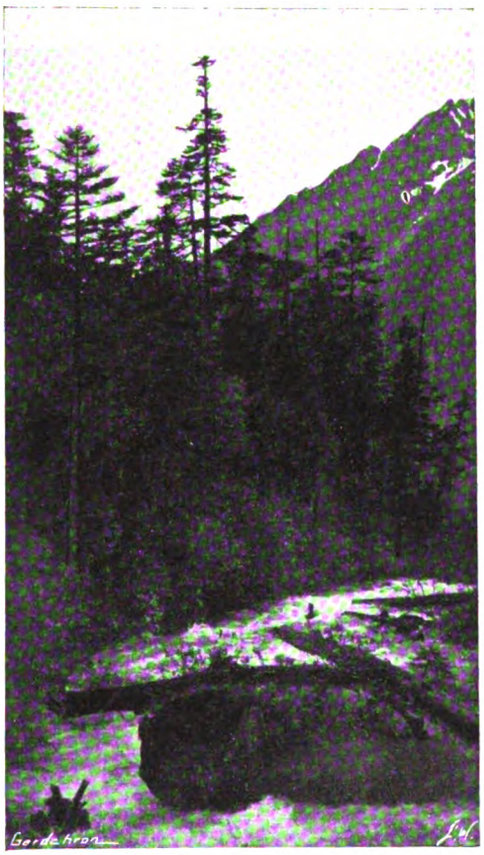

FIG. 46.—ABIES AND RHODODENDRONS BY THE STREAM; SALWEEN-IRRAWADDY DIVIDE.

there is much difference to the eye, at any rate, but it would be interesting to justify the latter species with a living example. My own views on the genus, with its several alleged species, I have already discussed.

Presently the valley opened out, and at 4 p.m. we halted, having marched just under six hours all told. Good quarters for the night were afforded by an immense block of granite, in the shelter of which we camped. I had time before supper to look about me and to collect seeds.

The valley just here was open and fairly level. The stream flowed more restrainedly over its granite gravel bed, and its high banks were lined with bushes, chromatic with autumn tints.

Conspicuous on the shingle flats were bushes of Rhododendron brevistylum (? K.W. 5428; one of the Heliolepis series); and on the great boulders was a low tangled bush, not rising 3 feet from the ground, with very hairy stems, petioles, and capsules (K.W. 5427). The long, stiff hairs at once suggest the Barbatum series; but the coppery-red indumentum of the under-leaf surface is reminiscent of Roxieanum, in whose favour I cast my vote—not having seen the flowers. In the shelter of the Bamboo brake, this species formed a sturdy bush 6 or 8 feet high; one wonders which attitude it will adopt in this country.

Another almost abundant species was one of the Neriiflorum series—a small, bushy tree with almost glabrous foliage and compact trusses of eight to twelve flowers (K.W. 5415).

Following a fine day, the night proved equally brilliant, the sky crowded with vivid stars. Our altitude was now 3,964 feet above the Salween, an ascent of 2,408 feet on the day's march.

The change of climate now began to make itself felt, and next morning the minimum thermometer showed only 39° F. The sky was still clear. We now found ourselves climbing from terrace to terrace, up an obviously glaciated valley. The "treads" of this giant stairway were covered with alpine meadow, divided by strips of Bamboo brake; the "risers" consisted of a confusion of boulders partly smothered under a dense growth of shrubs and trees.

On either side of us rose a sheer granite wall, bounding the valley. That on the left was the higher, and was furrowed at intervals by slots, down which stones slid and clattered; that on the right separated us from an upper parallel valley, down which flowed a glacier from the Gompa La. Through the gullies on that side we could see the flank of the glacier, a wall of ice high above our heads. Formerly it had spilled over into our valley and joined its glacier (now defunct); but since the general retreat of the ice, the floor of our valley had been lowered by water erosion, leaving the other glacier up in the air. As already remarked, all the glaciers on the east face of the Gompa La discharge into the one big valley.

To complicate the simple arrangement of "tread" and "riser," therefore, we had these huge cones of rubble shot down from the glacier on our right, athwart our path, besides a succession of streams. At one time we would be toiling up a "riser," jumping from boulder to boulder; at another, scrambling over a gravel cone, slit down the middle by a deep trench down which the torrent slurred: or forcing our way through a belt of Bamboo which rained dew generously down our backs; or wading up to our necks through a supersaturated meadow; or paddling across a torrent.

The forest, where forest still prevailed, consisted mostly of Picea, Pseudotsuga, Pyrus, Maple, and Birch, but trees were scattered over the landscape, forming a sort of park. There were also dense patches of scrub Willow, sere in leaf, and on the boulder beds a tangle of Rubus, Ribes, Enkianthus, Rhododendron and Vine, whose foliage was all the colours of the less refracted end of the spectrum; Clematis, Schizandra, and other woody climbers joined joyfully in the fray. There were Rhododendrons everywhere, but not in such massive formation as at Mu-li, though in far greater variety. Of them I shall have more to say later.

Presently we found ourselves on great bulging slabs of granite planed smooth by extinct glaciers. A small, ignoble Gentian was in flower here, and the clubs of a Lycopodium were conspicuous. Rhododendron sanguineum sprawled flat on the rock, though in the Bamboo thickets it chose to form a compact bush 3 or 4 feet high.

At 11.30 we halted for lunch and a rest, resuming at 1. Meanwhile the sky had become overcast, and an alarming drizzle set in. If the going had been difficult so far, it now became desperate. We could proceed by the stream no longer; the path—if an invisible track can be called a path—began to climb the mountain flank on our right, which consisted mostly of granite slabs as described. Unfortunately, they were sometimes covered with a veneer of bog, which slid away when I stepped on it. The result may be imagined. I collected seed of an Iris here (K.W. 5459), and also of a Primula.

The going did not improve. We paddled up steep stream beds through tunnels of Bamboo,

* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, 29, 1921; January 7, 21, March 11, 25, April 8, 22, May 6, 20, June 3, 17, July 1, 15, 22, August 5, 26, September 9, 23, October 7, 21, November 4, 18, December 2, 16, 30, 1922; January 13, 27, February 10, 24, March 10, 24, April 7, 21, May 5, June 2, 23, July 7, 21, and August 18, 1923.

Digitized by Google

climbed cliffs, and crossed several deep gullies. The rain changed to snow, and I grew seriously alarmed. All the peaks disappeared. Finally at 4.30 we halted in the last patch of Abies forest, high above the deeply eroded valley. It had been a good effort—seven hours' hard climbing, which accounted for another 2,621 feet. We were now 6,585 feet above the Salween.

The variety of Rhododendron met with during the latter part of the day was simply bewildering, and it was almost impossible to keep pace with them. They changed with ever-increasing rapidity as we ascended; and even the same species went through some protean evolutions, according to its habitat—this applies particularly to species of the Sanguineum and Haematodes type.

The capsules of the alpine species were mostly gaping, and I collected seed of half a dozen species, including a Saluenense (K.W. 5434) and a low-growing Haematodes (K.W. 5431).

Under the trees where we camped were several bark shelters, and these the men occupied; but I slept by the fire in my wee tent, for it was bitterly cold as soon as the sun disappeared. However, a brilliant sunset was succeeded by a splendid night. The arc of mountains at the head of our valley, with the pass we should have to cross on the morrow, was etched against the smouldering sky. Right above us towered the dark bulk of the Gompa La, its glacier gleaming like an iceberg. Dark clouds were sailing away over Burma, but below them flamed a broad bend of tawny sky. I sat by the fire for an hour after supper, writing my notes, then turned in dressed, for the cold did not encourage a casting off of garments. *F. Kingdon Ward.*

SNOWY FLY AND BIG BUD IN VANCOUVER.

THE Snowy Fly is found near the sea on the west coast of Vancouver Island under conditions which leave no doubt but that it is a native. In early summer all stages from the eggs to the mature flies are found on the underside of the leaves of Rubus spectabilis. Eventually the flies transfer themselves to the dense young foliage of Gaultheria Shallon and betray their presence by rising in swarms when disturbed. The perfect fly is not altogether snowy white; seen under the lens the upper pair of wings have certain brown marks, and these in some instances assume the shape of an arrow. It would seem as though the Snowy Fly had originally come from the warm south of Vancouver Island, maybe its northern limit in the open air. The pest appears identical with the white flies which infested Tomato plants in Britain forty to fifty years ago.

"Big Bud" is another pest which seems to have established itself on Vancouver Island without the aid of the white man. About eight years ago, and in the early winter, a plant of Ribes laxiflorum (a species belonging to the Ribesia or Currant division of the genus) was lifted from the forest of an uninhabited island in Barclay Sound. The following spring its unnaturally developed fruit buds indicated that something was wrong, and examination showed that the inflorescence was already destroyed in the buds, apparently by a minute grub which reduced the inside of the bud to a brown dust as in "big bud." The plant was cut to the ground and allowed to grow away from the root, and since then it has flowered normally.

Ribes laxiflorum is an interesting shrub with prostrate stems from 12 feet to 20 feet in length when growing in the shade; with orbicular five-lobed, cordate leaves, and erect racemes of brick-red, saucer-shaped flowers. Its fruit is glandular, bristly, globose, and wine-coloured. It grows near the coast from Alaska to the mouth of the Columbia River. Barclay Sound, Vancouver Island, is therefore near its southern boundary, and this record of it being infested with "big bud" may lead to knowledge of the geographical limits of this modern garden pest. *George Fraser, Ucluelet, B.C., Canada.*

LATE SUMMER FLOWERS.

BETWEEN the passing of the July flowers and the opening of those of autumn there is a gap of some five or six weeks when that portion of the garden devoted to hardy flowers is not very bright. It is not an easy matter in mixed borders to cater for all seasons well; in fact, the attempt entails much forethought and labour, otherwise the effect at no period is ever great. The easiest way out of the difficulty is to aim at securing the fullest display of bright colours in the months when the most appreciation is to be expected. In many establishments the owners are absent, but in others it is necessary to arrange for a good display for a few weeks to come. In such cases it might prove worth while to make the plants in season a feature, although it may have to be at the expense of earlier or later displays. Amongst the subjects for the period in question Gladioli are most dependable. There are several classes, but those recognised as autumn or large-flowering are the most in demand for border work, and varieties such as Golden West (orange-red), America (lavender-pink), Halley (salmon-pink), Enchantress (lilac), and good yellow and scarlet sorts, of which there are several, should be planted in groups of a dozen or so, such clumps being very effective. The Primulinus hybrids of Gladiolus, with their refined colours and graceful habit, are rapidly becoming popular. Unfortunately the hooded form does not reveal itself in all the hybrids which are included under the heading, but when recent varieties like Golden Girl, Nydia, White Buttercup and Myra become more plentiful, there will be no complaints.

The modern varieties of Montbretia are very beautiful. Since Star of the East was introduced great progress has been made with these flowers, and in the near future the Earlham Hall hybrids will rank amongst the most popular of early autumn flowers, but they need treating much the same as Gladioli to be a success; in fact, they are best started under glass and planted out.

Phloxes are invariably associated with Shrewsbury Show, the big event in the horticultural world finding them at their best. Not in every garden, however, are they an unqualified success, for only in the most favoured situations and in good soil is it possible to continue growing them profitably without propagating new stock from cuttings.

Pentstemons, especially those of the Southgate Gem class, are almost as valuable as Antirrhinums for bedding purposes, and there are several excellent tall growers which add to the display in the mixed border at this season. Dahlias have a lengthy season of flowering, and when well grown they are valuable assets to the garden in August. Of the various sections the freest and earliest are the single, decorative and star types.

Hollyhocks are worth grouping extensively, and by planting seedlings disease is less noticeable. Early-flowering Chrysanthemums in the mass are more a September than an August feature, yet varieties such as Carrie, Goacher's Crimson, Diana, and several of the newer singles, come in useful.

Amongst plants which lend variety to the mixed border, either as single specimens or in groups of three or so, Aster acris, a pretty shade of violet blue, is very useful. White is conspicuous in the late Ox-eye Daisy Alaska. Erigerons offer much variety, and of the later kinds Quakeress (lilac) and the newer mauve-pink, B. Ladhams, are both very showy. Sea Hollies in metallic blue are useful, and in Eryngium Oliverianum the heads are fine. Heleniums cover a long period, flowering from June to October, and adding considerably to the brightness of the border. For our purpose H. aurantiacum (2 ft.) and H. cupreum Crimson Beauty (2½ ft.) are dependable. Two good Sunflowers are to be had in Helianthus laetiflorus Daniel Dewar, and H. H. G. Moon.

Rudbeckia Newmanii has a neat, bushy habit, and the purple and brown flowers are very pleasing. Scabiosa caucasica, with its pale, bluish-mauve flowers, is never better than just now, and is well worth growing in quantity for cutting. The sea Lavenders and Statice latifolia, which produces cloud-like masses of lavender-coloured flowers of remarkable lasting qualities, are other good flowers for late summer. Thalictrum dipterocarpum is one of the most imposing border subjects, but unfortunately the plant is not quite hardy and requires, in many places, a sheltered position and light protection in winter. The foregoing is by no means a complete list of late summer flowers, but those enumerated are indispensable. *T. G.*

NOTES ON THE CULTIVATED PLANTS OF THE REPUBLIC OF SALVADOR.

(*Concluded from page* 118.)

As in most tropical countries, the variety of fruit trees is very great, but it must be admitted that the larger number of tropical fruits have little attraction for persons not accustomed to them, for too many have no other merit than sweetness. In Central America it is common to hear the native people say that a certain fruit is very good because it is so sweet. Most of the common tropical fruits are grown, such as the various kinds of Anonas, including the Soursop (A. muricata), whose enormous, spine-covered fruits, so heavy as to bend the branches to the ground, are used principally for flavouring ices and beverages; the White Anona (A. diversifolia), considered the best of its group; and the Sweetsop (A. reticulata). Avocados (Persea americana) are produced in abundance, but in quality they are not equal to those of Guatemala. Chrysobalanus Icaco bears a small, black, inspid, Olive-like fruit, similar to that of Simaruba glauca, which is a characteristic tree of the country.

All the Citrus fruits are cultivated, and Oranges of superior flavour are plentiful in the markets, being sold usually at about three cents per dozen. The Grape Fruit is rare, and it is probably too sour ever to become popular in Central America. The Lemon is seldom seen and its place is taken by the Lime. The Citrons, so common in the markets, are used in the preparation of a delicious confection of pleasing green colour. The Cashew tree (Anacardium occidentale) grows wild and is nearly always to be seen about dwellings. There are two varieties, with red and yellow peduncles, the fruits of which are much eaten, but are not especially agreeable to the palate. The roasted seeds are delicious, however, and are a good substitute for Almonds.

The Hog Plum (Spondias Mombin) grows with little or no attention, but the fruits of certain choice varieties are highly esteemed. The early Spanish explorers not inappropriately gave them the name of "Plum." for their fruits are closely similar in form and colour to those of the northern tree, and their flavour is much the same. The Mango is the favourite fruit of the Salvadoreans; the tree appears in every finca, affording refreshing shade, and unlimited quantities of Mangoes are consumed in their season. The Mamey (Mammea americana) is one of the most worthy of the common fruit trees, bearing a large, russet, globose or ellipsoid fruit, whose flesh suggests in flavour that of an Apricot or a cling-stone Peach. Two species of Passiflora are cultivated in the higher lands, and the fruit of one of them (P. ligularis) is of pleasant flavour and appearance. The Papaw (Carica Papaya) is very common, and is generally liked by those who make its acquaintance for the first time. Pomegranates are rare, but Guavas are so abundant as to become troublesome weeds. The Rose Apple (Eugenia Jambos) is a lofty tree with deep green foliage, bearing a small, buff, fruit containing a single seed, its rather hard flesh having a peculiar flavour that suggests nothing so much as highly scented toilet soap. The Star Apple (Chrysophyllum Cainito) deserves higher rank for its elegant foliage than for its innocuous fruit. The Sapote, Lucuma (Calocarpum) mammosa, is one of the most plentiful and favourite fruits, while several other trees of the same family (Sapotaceae) are generally cultivated.

The most valuable of Salvadorean fruits is the Banana. Salvador is the only Central American country which does not produce Bananas for export, but vast quantities are grown for local consumption, and they constitute an important part of the native diet. Several varieties are planted, that most esteemed for eating raw being the one which is commonly seen in northern markets. For cooking, the Plantain is best, but the Banana most grown in Salvador for that purpose is the Majoncho, a form with a short, pale yellow fruit and coarse, fibrous flesh. Next to Maize, Beans and Rice, it is the most general food among the poorer classes.

Upon the higher volcanoes the climate is sufficiently cool for the culture of the fruits of temperate regions. Strawberries of the American type (Fragaria chiloensis) are brought from the volcano of San Salvador to the markets of the capital at nearly all seasons. A delicious Blackberry, whose specific identity is uncertain, thrives upon the same volcano, and the berries bring a high price in the markets. At least two species of wild Blackberries are found in the country, but their fruits are so sour that they are little eaten. Quinces, Apples and Peaches are cultivated, but not extensively or successfully, for the fruit is small and of poor quality, although this may be the result of planting inferior varieties. Grapes are seen occasionally and at low altitudes, but they must be protected constantly against the attacks of a large leaf-cutting ant, which is the chief enemy of Central American horticulturists. The Zompopo, as this ant is called, will in a single night strip a tree or bush of its leaves, and is equally destructive to herbaceous plants. The most effective form of protection is a cement trough filled with water about the plots in which the plants are grown.

Upon some of the high mountains there may be found one of the rare tropical American fruits, the Pepino (Solanum muricatum), which in habit and inflorescence is much like the Potato plant. It bears a large egg-shaped fruit, yellow or striped with purple, which is eaten as a dessert fruit.

There could be mentioned numerous native plants which bear edible fruits, but in most cases these are of inferior quality and are little esteemed even locally. Such are the Sunzapote (Licania platypus) and the Ulozapote or Zapotillo (Couepia polyandra) which belong to the Rose family, although they bear little resemblance to the well-known plants of that group. The white Sapote (Casimiroa edulis) is common, and has a fruit which resembles in flavour and appearance a large Apple, with green or yellow skin, and is very good to eat. There is a popular belief, probably well-founded, that it induces drowsiness. A close relative of the Cacao, known locally as Cushta (Theobroma angustifolium) is grown at Sonsonate for its edible, highly scented fruit, whose seeds furnish a good quality of Cacao. The Patashte (Theobroma bicolor) also is grown at Sonsonate for its seeds, and the common Cacao (Theobroma Cacao) is cultivated in many places, but the quantity of seeds produced is small, and neither cocoa nor chocolate is much consumed locally.

Most of the well-known vegetables succeed in Salvador, even at low elevations. Those most grown, after Beans, are Onions, Garlic, Tomatos, Carrots, Beets, Lettuce, Radishes, Turnips, and Squashes. Peppers are common, but the very hot ones, which form so characteristic a feature of Mexican and Guatemalan cookery, find little favour in Salvador, although the Garlic employed is an equally obnoxious substitute. In the mountains, Cabbage and Cauliflower are produced with complete success, and I have seen Asparagus also. Peas are little planted and are rarely seen in the markets, where they are known, curiously enough, even among the country people, by the French term of *petits pois*. Watercress thrives in many of the streams and is, next to Lettuce, the most popular salad plant. Potatos have long been cultivated in the higher mountains, but their tubers scarcely exceed Walnuts in size. Sweet Potatos and Yams are much utilised, and the tuberous roots of the Yucca plant are a favourite and savoury vegetable. An American production is the Jicama (Pachyrhizus erosus), grown for its tubers, which resemble Turnips, are juicy and sweet, and eaten raw.

The markets are well supplied with Cucumbers, Cantaloupes, and Watermelons, and the last, strangely enough, are the most expensive of all Salvadorean fruits, at least during the dry season. Some of the larger ones realise as much as a dollar and fifty cents each, which compares favourably with the prices at which they are retailed in the United States in winter.

Lack of space forbids mention, in an already long list, of many other interesting plants that are noteworthy for various reasons. A mental picture of a tropical country usually abounds in Palm trees, but in Salvador these are not impressively numerous, except for the Coconut, that most graceful of all trees, which is a characteristic feature of the landscape at middle and low altitudes. Two towns, San Vicente and Sonsonate, are noted for their wealth of these, the latter so much so that it is known locally as the "City of Coconuts." There appear to be only about seven species of Palms native in Salvador. The leaves of one of them, an Acanthorrhiza, are much used for weaving hats. There are three species of the small and slender Palms of the genus Chamaedorea whose tender inflorescences furnish one of the most delicious vegetables that I have ever eaten.

Orchids, too, are always to be expected in a tropical country, although their abundance has been much exaggerated in the popular imagination. Because of the comparatively dry climate, they are not very common anywhere in Salvador, and of the few species represented not many are at all showy. The one notable exception is Cattleya Skinneri, plentiful nearly everywhere at middle elevations, the bushy plants as large as a bushel basket, perched high upon the trees and easily visible at a long distance. The richly-coloured blossoms are scarcely at all inferior to those produced in hothouses, but the people who gather them and bring the flowers to the markets seem not to esteem them above the humble annuals that are familiar in our own gardens. *Paul C. Standley, Assistant Curator, Plant Division, U.S.A. National Museum, Washington.*

INDOOR PLANTS.

BOUGAINVILLEAS.

BOUGAINVILLEAS are charming climbers admirably adapted for training up pillars or rafters in ordinary warm greenhouses and conservatories. They do best planted out in a well-drained border of rich, turfy loam and leaf mould, with silver sand added. When the plants are growing freely they should be relieved of all weak growths, otherwise they will soon become crowded with growth. They require plenty of light and air, but freedom from draught, to flower successfully indoors in this country.

Some years ago it was the custom to grow Bougainvilleas as stove plants, but it has been found that they succeed best grown in a cooler temperature, especially when required for exhibition purposes, as when grown in a stove temperature the foliage and bracts flag quickly. Many of the varieties may be grown as half standards and standards with pretty effect, also as bush specimens, and they will flower freely in 48 and 32-sized pots.

After the flowering period is over, which is about October, the plants should be kept moderately dry, and exposed to all the sun possible to ripen the wood for next year's flowering. In the spring, before starting them into growth, the branches should be shortened, and the old exhausted shoots cut out. If planted out in a large glasshouse there is no need to cut away many of the long, rambling shoots, but only to thin out the weaker ones. During the winter the temperature in which these plants are grown should be about 45° to 50°. They may be started in the middle of February, and when showing their flower buds should be fed with liquid manure once a week, to encourage the bracts to open freely.

Cuttings formed of half-ripened wood root readily in sandy soil, placed in a warm, moist frame or hand light. If rooted early they will make good strong plants for the following year.

The best Bougainvilleas for cultivation are B. glabra, a fine pale rose-coloured species, a free grower, and profuse bloomer; B. Cypheri, a deep rose form, a free bloomer and a good pot plant; B. Sanderiana, a remarkable free-flowering variety having flower bracts of medium size, somewhat darker than those of the type. The flower bracts are produced in great profusion on quite young plants. This Bougainvillea may be grown as standards, or as specimens in pots. At Camphill Queen's Park, Glasgow, there is a magnificent specimen planted out in a cool house, which is a mass of bloom annually. B. lateritia has brick-red bracts. This plant flowers freely out-of-doors in the South of France. Maud

Digitized by Google

Chettleburgh is a beautiful variety with rich rose-coloured bracts. B. Warscewiczii is one of the finest of the species, but unfortunately it is not so well known as many of the others. It has large deep rose-coloured bracts and is very free-flowering. The plant is grown to perfection in a corridor, amongst other greenhouse plants, by Mr. Maxwell, gardener at Errol Park, Errol, Perthshire. There are many other kinds, but those described are the best, and the plants make a grand display for a very long time with very little trouble or expense. *John Heal, V.M.H.*

THE BULB GARDEN.

THE LILY SEASON IN SOUTHERN SCOTLAND.

LILIUM regale, a native of Western China, is the most beautiful Lily I have seen for many years. I have had this incomparable species adorning my finest flower-border for the first time this season, and its artistic aspect, its wonderful combination of colours, brown, white and yellow, with green lines radiating (like Lilium speciosum Kraetzeri) from the centre, combined with fragrance, somewhat resembling that of Magnolia Watsonii, have made it an object of great admiration. This beautiful Lily deserves to be widely cultivated, and under very favourable conditions it may be grown from seed to full flowering size within two years. It has been cultivated with great success by Mr. McDouall, in Logan Gardens; where also L. Grayi, L. philippinense var. formosanum (a very distinctive and handsome Lily), L. nepalense, usually somewhat arduous of culture under open-air conditions, L. giganteum, L. pardalinum var. Burbankii, L. Humboldii, a species of impressive aspect, and the large flowered L. auratum platyphyllum, are grandly grown.

In the gardens of Monreith, Lochinch and Logan, in Wigtownshire, and in those of Southwick and Cavens in Kirkcudbrightshire, the great Lily of the Himalayas has for several seasons been quite commanding in its size and height, and in the number of its glorious flowers, whose fragrance, like that of Lilium speciosum, is highly fascinating, because it is refined. I often wonder that the latter highly artistic Lily, the culture of which is by no means exacting, is not much more extensively grown in our larger British gardens; especially as it is the latest, and assuredly one of the loveliest of them all. For my own part, I attach so much importance to its graceful aspect and delicate odour, when experienced by its cultivator on a calm evening in September, that I regard it as a veritable floral inspiration. The stately Madonna Lily (Lilium candidum), which I greatly fear is seldom adequately appreciated for its beauty and fragrance, and such splendidly effective varieties of Lilium longiflorum as Wilsonii and giganteum, are also eminently entitled, by reason of their artistic capabilities, to a much more extensive cultivation. *David R. Williamson.*

THE CULTIVATION OF BULBS IN FIBRE.

BULBS do splendidly grown in bowls containing fibre consisting of two parts moss fibre and one part each of finely ground sea-shell and charcoal. The fibre provides the rooting medium and retains moisture. The fine shell assists in maintaining a porous condition in the fibre, preventing it becoming stagnant. Air is essential to the roots of all plants and helps to convert the plant foods into a condition suitable for the plant. The charcoal serves the dual purpose of keeping the fibre sweet, and retaining moisture in its porous structure.

The bulbs should be planted in the bowls about the end of September. Make sure that the compost is in a thoroughly damp condition; this is very important, for if the fibre is the least dry when placed in the bowls it will be impossible to make it moist afterwards.

Place a few lumps of charcoal in the bottom of the bowl, to act as drainage. For large bulbs such as Hyacinths, Narcissi and Tulips, put an inch of fibre over the charcoal and press it down firmly. For small bulbs add sufficient compost so that when the former are placed thereon their tips will be half an inch below the surface of the bowl. Press the fibre moderately firmly, arrange the bulbs about a quarter of an inch apart, and cover them with compost, pressing it down slightly until the bowl is filled to within half an inch of its rim, and the tips of the bulbs showing through.

When the bulbs are set the bowls should be placed closely together, covered with about six inches of cocoanut fibre, and stored in a cool dark cellar, where they should remain for two months. When the plants start to grow they should be left uncovered for a few days, then removed to the rooms.

It is quite easy by selecting suitable kinds of bulbs to have a succession of flowers from Christmas to Easter. Thus, White Roman Hyacinths would be in bloom in December and January; Snowdrops, Crocuses, Scillas, Paper White Narcissus, Chionodoxas, Duc Van Thol Tulips, Muscari azureum, Polyanthus Narcissi,

FIG. 48. — SPARAXIS TRICOLOR VAR. ANGELIQUE.

and Hyacinths in January and February; Hyacinths, Narcissi, Jonquils, and Early Tulips in March; May-flowering and Darwin Tulips in April.

Narcissus Poetaz Elvira also makes a dainty display grown several together in a bowl. Empress, Golden Spur, Sir Watkin and Barri Conspicuous, are other good sorts of Narcissi for the same purpose. *W. Miller, Mill House, Horse and Groom Lane, Warley, Essex.*

SPARAXIS TRICOLOR.

CONSIDERING the brilliance of the varietal forms of these Cape bulbs, it is very surprising that they are not more often grown. Their cultivation is simple. The bulbs should be planted in autumn, and they do best in sunny, well-drained borders, in which they soon become perfectly at home. They are also admirable pot plants, requiring the same treatment as Ixias and producing a wonderful display of spring flowers for the conservatory. Few flowers, if any, are more brilliant than Sparaxis tricolor Fire King. The flowers, borne on branched stems less than eighteen inches high, are bright flaming scarlet, with a showy yellow centre surrounded by a rim of jet black. It is a most startling combination of colour that never fails to arrest attention. The variety Angelique (see Fig. 48) has lovely pale lemon-coloured flowers, deepening in tone to the centre. It is a beautiful form that might well have been called citrina. These Sparaxis are excellent as cut flowers. June is the month of flowering in the open. *Herbert Cowley.*

HARDY FLOWER BORDER.

ROMNEYA COULTERI.

THIS giant Poppy of California, with its large blossoms 6 inches or 8 inches across, pure white with a golden disc in the centre, is an exceedingly beautiful plant. Its petals are like crimped and fluted satin, and the display of flowers extends over several weeks during July and August. It is not an easy plant to establish, and should be grown in deep, well-drained, sandy soil, and afforded a sheltered position.

This Romneya is said to grow from seed, but although seed is sometimes produced, it seldom thoroughly ripens in our climate, and the best way to increase the stock of plants is to insert root cuttings in the autumn.

For this purpose a portion of the root should be carefully uncovered and a straight piece about half-an-inch in diameter severed from it, which may be cut into two-inch lengths. The long, woody roots of this plant taper very little, and care should be taken when cutting them into lengths to make sure of the right end of insertion. Each root cutting should be inserted separately in a three-inch pot in a compost of light, sandy material; the upper part of the cutting should be only slightly covered, and it should be quite firm in the soil, which should be fairly moist. The pots should then be plunged to their rims in a bed of coal ashes, in a cold frame, and kept free from frost. In the spring the young plants will make new growth, and under favourable conditions they may be planted out in June. Weak plants, however, will be better grown on in pots until the following spring.

In cold districts Romneyas are often cut to the ground in winter, but they make much finer growth and produce more flowers when their branches come through the ordeal of our winter climate uninjured. *W. Auton.*

THE ALPINE GARDEN.

GENTIANA PNEUMONANTHE.

THE Marsh Gentian, a strictly local, if not rare, native species, possesses at least one attribute that is common to many of its race, and that is an extreme variability. Not only does this plant vary in stature and manner of growth, some forms being but a few inches in height and rigidly upright, while others will attain to 9 inches, and assume a semi-prostrate manner, but the leafage differs considerably.

There are also said to be branched forms, which I have not seen, and types exist in which the stems are crowned with but one flower, or a bunch of several. The blossoms, in an average specimen, are held upright and are deeply and narrowly bell-shaped, or tubular. They are a rich sapphire-blue within, tending to azure at the tips, while the outside is a dull blue striped and suffused with a metallic green. The white form, with its delicate touches of gold and green, is a singularly lovely plant. Though G. Pneumonanthe is a plant of peaty bogs, it will prosper in any cool corner in peat and sand or leaf-mould and loam, with full exposure. There is an alpine form in which the flower is considerably larger than that of our native plant. The latter commences to bloom in August and continues into September.

TULIPA LINIFOLIA.

TULIPA LINIFOLIA is a charming species, six to nine inches high, with narrow leaves and good-sized flowers of a brilliant vermilion-scarlet. The leaves are narrow, and are prettily waved. Plant the bulbs in rich but light soil, surround them with sand and cover them with three inches of sandy soil. *S. Arnott.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante, pp. 71-76.)

(*Continued from page* 121.)

MIDLAND COUNTIES.

HERTFORDSHIRE.—Apple trees set fruits freely, and the Apple crop is an average one; but if the dry weather continues many fruits will drop prematurely. Strawberries were very good, and the berries of large size, which I attribute to mulching the beds with manure early in April. Bush fruits have been very plentiful, especially Gooseberries, which are of large size and good flavour. Morello Cherries were good, but not very numerous. The soil is of a light texture, resting mostly on chalk. *James A. Paice, Aldenham Vicarage Gardens, Watford.*

——The fruit crops are the worst I have known here for several years. All fruit trees were a mass of blossom, and had apparently set their fruits, especially Pears and Plums. We have no Pears either on wall trees or in the open, and very few Peaches and Nectarines. Court of Wick is the only variety of Apple with a heavy crop, requiring thinning, the next best being Lane's Prince Albert. We have a fair sprinkling of Worcester Pearmain, Ribston Pippin and Cox's Orange Pippin. I attribute the failure to the unfavourable weather conditions during April and May, also to lack of sunshine during the setting period and insect pests later. Strawberries were good, although small on account of drought. *Geo. H. Hill, Caldecote Gardens, Bushey Heath, nr. Watford.*

——The fruit crops are, generally, disappointing, yet there was good promise for most kinds of fruits early in the season. Apple trees flowered splendidly, but, in spite of precautions, such as grease banding and persistent spraying, the trees have been very badly infested both with caterpillars and aphis, some of the larger trees being practically stripped of their leaves. This is, in my opinion, chiefly owing to two causes: (a) the ungenial and cold spring, and (b) the absence of good cleansing rains, the rainfall here having been very light. Of Pears we have almost none, the trees bearing practically no flowers after the heavy crop of last season, though they look perfectly healthy. Plums and Damsons of all kinds flowered freely and set fruits abundantly, but in the majority of cases the latter failed to swell. Our best crops are Victoria, Coe's Golden Drop and Monarch; the only Damson with a satisfactory crop is Langley Bullace, which variety never fails us. Bush fruits generally were prolific crops, except Black Currants, Strawberries suffered severely from frost. *Edwin Beckett, Aldenham House Gardens, Elstree.*

——The promise of abundant fruit crops has not been realised. Adverse weather, long periods of cold, drying winds, and exceptional low rainfall in June, caused the fruits to drop after they were well set. Even where protection was afforded, sunless days caused a reduction of the crops. Apples are fairly satisfactory, but since the heat wave, commencing early in July, even they commenced to drop. However, a certain amount of self-thinning will be welcome. Pear trees developed few blossoms, and a large crop was not expected. Plums set well, but persistent cold periods prevented them from swelling, and the crop is small. Peaches and Nectarines were affected in a lesser degree, but the foliage suffered considerably, and damage by hail was evident on these and other fruits. Small fruits escaped damage, as we placed fish-netting over the more exposed bushes when exceptional frosts occurred. The exceptionally heavy rainfall during the severe storms of July 9 and 10 (3 inches, 2 inches and 1 inch respectively fell) helped the Strawberry and Raspberry crop very much, as at that date the main crops of the former was just coming in. Our soil varies; in parts we have loam and in others clay, overlying chalk. *A. J. Hartless, King's Walden Bury Gardens, Hitchin.*

——The Apple crop in these gardens is very good, and in most cases the trees have set sufficient fruit to necessitate thinning. The following are the best cropped varieties: Cox's Orange Pippin, St. Everard, Beauty of Bath, Lane's Prince Albert, Rev. W. Wilks, and Rival. Aphis is not so troublesome this year as last. Pears are a complete failure outside, but Pear trees in the fruit case have cropped so freely as to require thinning. Plums on walls are very good, but standard Plum trees have a very thin crop, and the same is true of Damsons. Cherries were good, but aphis has been very troublesome. Peach trees are carrying sufficient fruit, but owing to the dull, cold weather in the early spring, Peach blister has been very troublesome this year. Small fruits were very good, and the fruit of excellent quality, especially where the bushes were kept well supplied with water during the hot weather in the early part of July. *T. Pateman, Brocket Hall Gardens, Near Hatfield.*

LEICESTERSHIRE.—Fruit is very scarce in these gardens, although in the early part of the year there was great promise of good crops. Cold, sunless days and cold winds, with frost, spoiled the prospects. Blight and caterpillars were very troublesome on fruit trees, and syringing did not seem to destroy them before the damage was far advanced. Our soil is heavy to light in texture. *W. Coe, Prestwold Gardens, Loughborough.*

——The crops of Apples, Pears, Plums, Cherries, and Raspberries, are complete failures, due to severe frost on May 24, when we registered 8 degrees, and partly due to the very mild winter and immatured fruit buds. *Wm. Paterson, Swithland Hall Gardens, Loughborough.*

NORTHAMPTONSHIRE.—In the early spring there was great promise of good fruit crops, but on May 15, a severe hailstorm did much damage to the crops. After the storm many trees and bushes had the appearance of being fired at with buckshot. Several frosts in succession did further harm, but even then fair crops would have been obtained in sheltered positions. Then came the most destructive frost of all, on the morning of May 23; 8 degrees were registered on the screen, and eleven on the ground, and all prospects of a good fruit year vanished. *F. W. Gallop, Lilford Gardens, Peterborough.*

——The Apple crop promised well, but the fruits were nearly all ruined by frost at two different periods, when the blossoms were fully expanded. Pear trees failed to bloom; having carried heavy crops for the two previous years they could not be expected to flower well this season. The first blossoms of Strawberries were ruined by frost, but the crop surpassed expectations, although it was a fortnight late. Severe frost on May 24 did considerable damage in this neighbourhood. *Arthur R. Searle, Castle Ashby Gardens, Northampton.*

NOTTINGHAMSHIRE.—The fruit crops are disappointing; the weather conditions were unfavourable to clean, healthy growth, consequently all kinds of pests and diseases were troublesome, and spraying was almost a waste of time and material, as the prevailing high winds made this operation at the proper period for prevention practically impossible. Most early varieties of Apples are bearing good crops, but late sorts such as Bramley's Seedling, Newton Wonder and Sturmer Pippin are very poorly cropped. New Northern Greening is an exception; this is not a first quality cooker, but never fails to crop in these gardens, and it does best in a grass orchard. Pears are very scarce. Plums would have been a good average crop but for aphis; spraying has helped to retain a fair sprinkling of fruits, Czar being easily the best cropper. Cherries and the soft fruits are the redeeming features in the fruit crops. Our soil is a deep, medium loam on red clay. *William R. Scott, Bunny Park Gardens.*

——Plums and Pears are failures, and Apples are patchy. The trees were full of blossom, which appeared to set well, but cold winds and low temperature during May and June, together with the ravages of aphis, and insect pests, caused Plums, Apples and Pears to drop wholesale. Cherries and Strawberries were both rather under average crops. Gooseberries were good. Red and Black Currants were medium crops. *S. Barker, Clumber Gardens, Worksop.*

(*To be continued.*)

RED PLANT DISEASE IN STRAWBERRIES.

IN their letter, published in your issue of August 11 (p. 88), Messrs. Ballard and Peren appear to misconstrue the main issue.

I have consistently claimed that "Red Plant" disease was produced by eelworms. This claim is not refuted, but becomes substantiated by the statement that the eelworm which produces the disease has now been identified as Aphelenchus fragariae, Ritz. Bos.

The Long Ashton experts have been investigating this disease since 1920. As a result of visits to the affected area, and an examination of affected plants, they gave it out as their considered opinion that parasitic eelworms could not be found in affected plants from the Tamar area. I challenged that statement, and particularly so with Mr. Peren at the Bath and West Show, and again at Long Ashton. Mr. Peren will remember that at the Bath and West Show (Plymouth, June, 1922) I asked one of the assistants for, and obtained, a crown bud from one of the Long Ashton plants, in which eelworms were not supposed to be present, and that I demonstrated the presence of large numbers of eelworms in the centre of the bud (perhaps the name of this species can now be given). I am now informed by the joint authors that there are many species and even genera of eelworms! Do the joint authors imagine that I should have staged an eelworm exhibit at the "Bath and West" (which included "Cauliflower" and "Red Plant" in Strawberries: Root Knot diseases of Beet, Cucumber and Tomatos; Narcissi, Fern and Carnation eelworms; ear-cockle in Wheat; eelworms in Hazel big-buds, in Black Currant big buds, and in diseased Pea cotyledons) without knowledge of such a very elementary matter? In one lot of Strawberry plants alone, which were sent to Harpenden for examination, something like six different species were found, and only one of these, the Aphelenchus, parasitic. On a previous occasion Mr. Peren was kind enough to ask if I would tell him the difference between parasitic and free-living eelworms.

After three years pegging away at the research stations I am guilty of "vague pronouncements." I stated emphatically at the Long Ashton meeting of the Horticultural Education Association in September last (after Mr. Peren had given his discourse on "Red Plant" disease, suggesting Mosaic as the cause) that despite what had been said by Mr. Peren as to the cause of the disease, I was satisfied, after having examined thousands of affected plants, that eelworms were the cause of the trouble, as I had invariably found numbers of parasitic eelworms in the crown buds of affected plants. I also asked what these pests were supposed to be doing there if they were not causing trouble direct; were they spreading the virus? I also told Mr. Peren privately that I had succeeded in reproducing the disease in two Strawberry plants which were previously unaffected, and that I hoped to continue the experiment in 1923.

I have done my best since 1920 to get the Ministry's experts to agree that the disease was produced by the eelworms, and I have told the Tamar Valley growers that I was positive that the disease was caused by eelworms, and have suggested various methods of cultivation in order to combat the trouble. I also stated that, so far, I was alone in these views, but that I felt confident that the experts would accept the theory before very long.

As to publication, am I to understand that

Digitized by Google

because my views have been stated in the *Gard. Chron.*, in county reports, and in reports to the Ministry of Agriculture, as well as publicly (with my microscope at hand to back them up), and I have not published a set thesis on the subject, naming the organism, instead of giving it the general term eelworm, that they are to have no consideration whatever, whereas those who have denied the presence of eelworms in the affected plants and suggested Mosaic disease as an alternative, can claim full credit for a *new* discovery?

It is generally conceded that while it is easy to distinguish between parasitic and free living eelworms, only those like Dr. Ritzema Bos, who are eelworm specialists, are able to give an authoritative diagnosis as to the genera and species of any specimen. If Long Ashton now have such an expert in Mr. Ballard, I am pleased to hear of it, as there is a good deal of eelworm trouble in the West of England and in the Isles of Scilly, and information as to a practical cure would be appreciated by a large number of growers.

I may have made a mistake in not sending my specimens to the Continent so as to obtain an authoritative diagnosis of the eelworm causing the trouble in Strawberries; but, in any case, I had the assurance of Dr. Fryer, of Harpenden, that eelworms were present in the affected plants, and that the parasitic form found was an Aphelenchus.

Appended are quotations from a letter to Professor Cotton, and from his reply, while he was still at Harpenden:—

County Hall, Truro,
March 26, 1922.

DEAR COTTON,—Some time ago, when discussing the Red Plant disease of Strawberries, I promised to send you along any specimens which actually showed the eelworms in the buds of the affected plants. (You will probably remember that I have contended that the so-called Red Plant disease of the Tamar Valley was due solely to eelworms.)

The plants in the enclosed box came from a private garden at St. Tudy. On seeing the plants I suspected eelworm trouble, and brought away some specimens for examination. I think you will agree with me that there are sufficient eelworms present in the buds of these plants to make any plant look sick. . . . I am of the opinion that this trouble is very general amongst Strawberries, and as affected plants only flower with difficulty, I am of the opinion that much of the so-called blindness of Strawberries is due to eelworm.

Pathological Laboratory.
Milton Road,
Harpenden, Herts,
March 30, 1922.

DEAR JOHNS,—With regard to your letter as to Red Plant, Mrs. Alcock has examined the Strawberry shoots, and finds, as you say, that eelworm is present. They (the shoots) are, moreover, distinctly puffy and rather suggestive, in advance, of parasitic species being present. *W. H. Johns.*

FRUIT REGISTER.

RED CURRANT LAXTON'S PERFECTION.

ALL who desire a good Red Currant should plant this variety, as it is quite the finest I am acquainted with. The bunches are very long, the individual berries of great size and deep red colour, and the variety is a large cropper. The bunches on some young trees I have hang all round the main stem and on the base of the branches as thickly as they possibly could.

The plant is a strong grower, and each bunch has from 15 to 20 berries. It is not quite so early as some varieties, which, in one respect, is a point in its favour, and the bunches will hang a long time in good condition, even through such hot weather as we have experienced this July. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

TREES AND SHRUBS.

HYPERICUM HOOKERIANUM VAR. LESCHENAULTII.

THIS is incomparably the finest of all the Hypericums grown at Glasnevin (see Fig. 49). The flowers, produced at the ends of twigs of the current year, often exceed three inches in diameter, and are of a deep, rich yellow. Grown in a sunny position, the leaves are glaucous on both surfaces, though to a much greater degree on the lower surface. The smooth young twigs are flushed with reddish brown on the sunny side, and the older shoots are brown. At Glasnevin we find the variety a little more tender than the type, but given the protection of a sunny wall or a sheltered nook it could probably be grown in most parts of Britain and Ireland. *J. W. Besant, Glasnevin Botanic Gardens.*

FIG. 49.—HYPERICUM HOOKERIANUM VAR. LESCHENAULTII.

TILIA MAXIMOWICZIANA.

TILIA Maximowicziana is a native of Japan, and produces the most powerfully-scented flowers among the species in the Kew collection. Last year there were few flowers, but this year an abundance. The trees I have in mind were planted about 1910, and are 6 metres or so in height, with a girth of 5 decimetres. Although the trees are not on their own roots, having in the first place been grafted on to another stock, they are nevertheless in healthy condition, upright and with splendid buds, due, no doubt, to judicious pruning, and they give promise of a long future and much larger dimensions.

The trunk is smooth, without any signs yet of fissures, dark coloured, with main branches thrown out at an angle of 60°, forming a pyramidal top; the leading shoots are flexuose. The branchlets are grey, covered with starry down, and carry bright green leaves which are roundish-ovate, 9-14 cm. long and 8-10 cm. broad in their widest parts, oblique, with heart-shaped base, and short-pointed apex; the leaf margin is toothed, with glandular tips. Although the upper leaf surface is practically smooth, the lower is completely covered with short, grey down, which is densest in the vein axils; the petioles are rather sender, but firm enough to hold the leaves forward.

The pedunculate bracts are long and narrow (many malformed), 8-9 cm. long, 2 cm. broad, somewhat downy, from which hang the inflorescences, generally with 6-12 flowers, but sometimes so many as 20, yellow or honey-coloured, very strongly fragrant.

Fruits are produced in abundance, and are quite a feature, as seen on the trees from distance, the lowest to topmost branch being embellished with the hanging cymose clusters. At present they are the size of Peas, and not quite so round, globose, densely felted, and plainly five-ribbed. Whether the seeds will mature is yet uncertain, probably some will. It will be interesting if they do, as then young stock may be grown without recourse to grafting.

With the exception of Tilia japonica and T. Miqueliana, two supposed species from Japan, this is the only one I know from that country. *C. F. C.*

TILIA KINSIANA.

SINCE I wrote the note on Tilia Maximowicziana above, I have paid a visit to the Herbarium at Kew, and inspected the Tilias from Japan, and found T. kinsiana from Central Japan. Judging from the specimen the tree must be quite different from all cultivated species and forms. If seed or stock could be obtained and plants grown in this country, and found hardy, I believe T. kinsiana would be a most notable addition and introduction. *C. F. C.*

HYDRANGEA MOUSSELINE.

THE Hydrangeas are very fine for shrubbery planting, and nearly all of them carry handsome trusses of bloom. The variety Mousseline is almost an exact counterpart of H. hortensis, with the exception that it is quite hardy. The foliage falls during the first sharp frost, but the plant throws up strong shoots from the base, which are crowned with large trusses of lovely pink bloom during July and August. Shrubs that flower during the summer and autumn are especially valuable, and this Hydrangea is one of the best for brightening up the shrubbery during that period. In dry weather Hydrangeas should have their roots well soaked with water and occasionally with liquid manure. *R. W. T.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Bokhara Clover. — Your correspondent *S. B. D.*, commenting on p. 85 on a piece of journalism characteristic of a section of the daily press, goes on to express a personal estimate of this Clover which we feel should not be allowed to pass unchallenged. The fact remains there are in Great Britain and Ireland farmers (practical men) who cultivate this fodder, and that in America it is grown very extensively both for forage and for green manuring. Sweet (or Bokhara) Clover is unfortunate in its name. For it is not a Clover, properly speaking, and requires very different handling. Once it commences to "go to seed" it is, as a fodder, as unattractive, and possibly as unpalatable, as a Swede, a Mangel or a Cabbage would prove under similar circumstances. Lucerne itself over-ripe is woody. Sweet Clover may be grown under conditions where Lucerne does not succeed, and, in fact, has been found valuable as a preparer of the ground for this crop. We are of the opinion that a place will be found in this country for Sweet Clover, not displacing but supplementing other Legumes. In some sections of the United States this plant is replacing Red Clover in rotations, partly for the sake of the superior amount of humus it contributes. This (we are speaking of the original biennial Sweet Clover) is frequently confused with the new annual variety of same—"Hubam." Though botanically identical, they are sufficiently distinct to warrant us reserving the exclusive use of the older term for the original plant, so we prefer always to speak of the annual variety as Hubam. This word was invented to connote the name of the discoverer (Professor Hughes) and the place of its origin—Alabama. *William Power and Co., Waterford.*

St. Cuthbert's Cole.—I have been out of England for a month, so have only just seen Mr. R. W. Brotherston's note in your issue of July 14 (p. 27). I am rather puzzled, for I cannot find the name, nor anything even like it, in "the list of old names at the end of Gerard's *Herbal*." "Cutbertole and Cutbertill"—the nearest approximations, are stated to be Branke Ursine (Acanthus), as also is "Sedocke," which, in Johnson's edition, is spelt "Sea Docke." I may say that when compiling our *Dictionary of English Plant-names* we, of course, consulted this most interesting list, and included most of the names—among them those above quoted—but attempted no explanation, which, indeed, I think is still to seek. *James Britten.*

Gardeners' Hours.—I regret to see from your "Answers to Correspondents" column that the practice of young gardeners working overtime still continues, and fear it is not always accompanied by sufficient remuneration. In a well-managed garden it is only on very rare occasions that overtime work is strictly necessary; the usual stoking and closing of ventilators, which is taken in turns by the men in connection with Sunday duty, is on a different footing, and cannot be avoided; this—like the farmers' men attending to cattle—is a work of necessity; it should, however, always be paid for. But ordinary garden work is different, and should be completed in the ordinary working hours of the district; and overtime work is absolutely wrong in principle, and is not profitable to the employer or good for the employee. The after-effects of the great war have made matters very difficult for gardeners in private places; many employers cannot afford to spend more on their gardens than they did before the war, consequently the number of men employed has to be much reduced. In such cases employers should arrange to discontinue some part of the garden work, and not expect the gardener to accomplish so much as when perhaps he had double the number of men. *W. H. Divers, V.M.H.*

Flower Shows (see p. 97).—I read the leading article on flower shows with interest, and suggest that all profits from such shows should be given to some local charity or hospital. [Our correspondent evidently suggests this in order to escape payment of the entertainment tax.—EDS.] There are several reasons for the lack of interest in flower shows, and I would suggest that the great need is more novelty, for visitors will talk more about one novelty than all the rest of the exhibits in the show. Flowers should be displayed to demonstrate their uses, and especially their utility when cut, and boards used for the display of Pansies, Violas, Daisies, etc., at flower shows should be forbidden. We need more and choicer collections of fruit at flower shows, whilst in the case of vegetables there should be more classes for collections and fewer for single dish classes, as one well-displayed collection of vegetables is worth fifty single dishes. I am willing to admit that flower shows have greatly improved, but we need something more artistic and attractive in the arrangement of shows, for bare boards are an eye-sore, and all labelling should be legible but unobtrusive. *Acorn.*

Pelargonium Unique and others.—I was much interested in Mr. Lynch's note (page 84) on this old plant. Up to 50 years ago it might still have been seen planted as a specimen in the flower garden, and for the greenhouse it was trained balloon-shape in large pots, it being a plant that required plenty of root room. I have it here but not in bloom, although I consider Mr. Lynch's colour, "deep rose-pink," is not applicable to this variety; a rose-purple might more correctly describe its colour and, indeed, I find Purple Unique and Rollison's Unique in an early magazine recorded as synonymous. I think I am right in stating that the Uniques, with one or two exceptions, are derivations of P. quercifolium. They are rampant in habit, and besides the above there is the scarlet and lilac, and Moore's Victory (also Moose's Victory and P. moreanum) is probably the oldest of the family. It is the only one I find noted in a list of Pelargoniums for the greenhouse in 1838, and it occurs even earlier, but the correct date I do not know. There is a variety, Fair Helen, like the sport Mr. Lynch describes. There is, or was, a dwarf zonal with stems as colourless as those of Freak of Nature, which had a great popularity for bedding, and was named Cerise Unique. In the garden where I was an apprentice a collection of these fragrant Pelargoniums was cultivated. They were kept in sunk pits during the winter and planted out in summer; they proved a very interesting feature of the garden. But there is not a great number worth perpetuating. The everywhere-grown P. graveolens in variety, fragrans, crispum variegatum, Lady Plymouth, Duchess of Sutherland, Pretty Polly and filicifolium or Pheasant's Foot, once so much in demand for buttonholes and bouquets and the Uniques would form a nice selection. The last named, it may be noted, possesses quite a pleasant scent. I may add that some of these are readily propagated from root cuttings—Fair Helen, for instance. *R. P. Brotherston.*

Dahlia Coltness Gem.—Although Dahlia Coltness Gem appears to have become extremely popular in gardens throughout the south of Scotland, very little has been written concerning its value for garden decoration in the south of England. It may therefore be interesting to observe that a large bed of this variety at Kew, near the Palm House, is at present making a fine display of richly coloured flowers and, curiously enough, the shade of colour is softer than the brilliant hue seen in Pelargonium Paul Crampel, only a few yards away. It is obvious, however, that this dwarf Dahlia needs some attention during its flowering period, for unless the seed pods are removed at frequent intervals the plants are likely to lose their vigour and the display will be spoiled and shortened. I am led to make this observation after seeing a small bed of this Dahlia in a front garden at Swanley, where none of the seed pods had been removed and at approximately the same date (August 17) the plants at Swanley were exhausted and ineffective, while those at Kew retained their vigour and continued their brilliant display. *C.*

SOCIETIES.

ROYAL HORTICULTURAL OF ABERDEEN.

AUGUST 23, 24, and 25.—Entering upon its centenary year—it was instituted in 1824—this society continues with ever increasing and untiring endeavour to stimulate an interest in horticulture in the large area it embraces. Next year the Scottish National Sweet Pea Society will hold a joint show. This year's show was held in the Union Terrace Gardens, Aberdeen, on the above dates. While very conveniently situated—they are in the centre of the city—it must be admitted the gardens are not quite an ideal venue for a flower show. More space must be provided, and this will best be found in a return to the Duthie Public Park, Aberdeen, where for many years the society has held its annual exhibitions. Nevertheless, the display this year was a wonderfully good one, the quality all through excellent, the colour fine, the arrangements good, and the competition keen.

Some fine exhibits were shown in the section for plants. The best table of pot plants arranged for effect (not exceeding 7 ft. 6 in. by 6 ft.) was shown by VISCOUNTESS COWDRAY, Dunecht House, Aberdeenshire (gr. Mr. William Smith), who had a fresh lot of flowers, superbly arranged; 2nd, Mr. A. E. BENZIE, Morkeu, Aberdeenshire (gr. Mr. W. Henderson), with a meritorious display; 3rd, Miss MCLENNAN, Springhill House, Aberdeen (gr. Mr. D. L. Scorgie). Leading places for specimen plants, Ferns, and plants for dinner-table decoration were gained by LADY COWDRAY with very attractive entries. Zonal Pelargoniums, Fuchsias, and Begonias from Morkeu worthily gained the premier honours, and for Pelargoniums and Begonias the best were those sent from Enfield, Aberdeenshire (gr. Mr. R. Murray). In short, the display in this division formed a bright and attractive feature of the exhibition.

Very good entries were seen in the cut flower section, the outstanding features of which were the Roses and Sweet Peas. The silver challenge cup offered for the best 18 blooms of H.P. and H.T. Roses, or either, distinct varieties, was worthily won by COLONEL GILL, of Dalhebity, Aberdeenshire (gr. Mr. A. Brebner), with a capital exhibit in which the leading varieties were of outstanding excellence. The leading honours in the other Rose classes also went to COLONEL GILL, while LADY COWDRAY and Mr. D. B. D. STEWART, Banchory House (gr. Mr. J. Cameron), followed closely behind. The best Cactus Dahlias were shown by Mr. J. COUTTS, Woodhill, Aberdeen, whilst Miss MCLENNAN, Springhill House, excelled for Single Dahlias. In the other classes—Asters, herbaceous flowers, and fine foliage bedding plants, including annuals—Mr. COUTTS, Woodhill, contributed a fine display and gained the chief awards. LADY COWDRAY led for Zonal Pelargoniums and Begonias, with remarkably good entries. Sweet Peas, considering the unfavourable season, were well shown. The redoubtable grower of Sweet Peas, LADY COWDRAY, Dunecht House, who met with such success in St. Andrew's Hall, Glasgow, on July 25 and 26 last, when she contributed some superb blooms, had to give way to the entries from Duff House, Banff (gr. J. A. Grigor). The Banff House flowers were remarkably good, and proved one of the brightest and most attractive features of the exhibition. Mr. GRIGOR'S outstanding blooms were of Royal Scot, Cecily, Austin Federick, and Hebe.

FRUIT.—Some very meritorious entries were forthcoming in this division, with the exception of Grapes, which have never been an outstanding feature of the Aberdeen show. LADY COWDRAY won the premier prize for a collection of 6 dishes of hardy fruit, not more than 2 dishes of any kind, with a well-grown selection. Hardy fruits were all well represented, especially in the Black Currant classes. The leading places for Strawberries were taken by DENMORE HOUSE, Aberdeen (gr. Mr. Geo. Tocher), and Rubislaw, Aberdeen (gr. Mr. Norman M. Duncan), led for yellow, green and red Gooseberries. Mr. LUMSDEN, Balmedie House, Aberdeen (gr. Mr. Robert Pirie), had the best Red Currants. The 1st prize for Black Currants was won by Mr.

Digitized by Google

DUNCAN for remarkably well-grown specimens. As already noted, Grapes were not greatly in evidence, but the entries from Mr. BENZIE, Morkeu, and from Cortes, Lonmay, Aberdeenshire (gr. Mr. W. K Murray), were good. LADY COWDRAY led for Melons, while the premier places for Peaches and Nectarines were taken by Mr. A. R. MCRAE, Castle Fraser Gardens.

VEGETABLES.—As is ever the case at the Aberdeen show, the chief feature in this division was the superb display of clean, shapely, well-grown Potatos. As is her wont, Miss MCLENNAN, Springhill House, Aberdeen (gr. D. L. Scorgie), led with a superb collection of vegetables, arranged on a table space 4 ft. by 3 ft., and comprising 9 varieties., viz. Peas, Cabbages, Cauliflowers, Potatos, Turnips, Carrots, Onions, Parsley, and Beetroots. She excelled likewise for salads, Carrots, Cucumbers, Beetroots and Potatos. Messrs. W. and B. LAWSON, market gardeners, Cornhill, Aberdeen, had finely-grown exhibits in the Potato classes, and also led for Cabbages and Turnips. Potatos made a fine show, and the leading honours were divided by Springhill House, Duff House, Linton House, Cluny, Aberdeenshire (gr. Mr. Andrew Gardiner), and Cornhill.

NURSERYMEN AND FLORISTS.—Messrs. ADAM and CRAIGMILE, Fernielea Nurseries, Aberdeen, led in the class for 36 blooms of H.P. and H.T. Roses, or either, named, distinct varieties, and for which they worthily gained the R.H.S. Silver Challenge Cup. It was a good entry, the varieties shown being of outstanding excellence. This firm also won first place for 24 Tea or Noisette (or either) Roses, distinct.

NON-COMPETITIVE EXHIBITS.—Some exceptionally fine exhibits were staged by nurserymen and florists of Aberdeen. The firms showing were: Messrs. W. SMITH & SON., Ltd., Burnside, Forresterhill, and Silverhillock Nurseries, Aberdeen; Messrs. BEN REID & Co., Aberdeen; Mr. M. H. SINCLAIR, Aberdeen; and Messrs. KNOWLES & SONS, Aberdeen and Kent.

ROYAL HORTICULTURAL OF IRELAND.

THE autumn show of the above society was held by kind permission of the Earl of Iveagh, K.P., in the covered court, Earlsfort Terrace, Dublin, on the 14th and 15th ult. The number of entries were nearly double those at any show held since the war, and the weather was ideal. Hardy flowers were, as usual, a strong feature. Mrs. GEORGE MITCHELL, Mrs. STEPHENSON, the Hon. A. E. GUINNESS, Madame FOTTRELL, Capt. DALY, and Major KELLY, were the chief prize-winners in the classes for hardy flowers. In the class for annuals, twelve bunches distinct, Lord ARDEE, Kilruddery, Bray (gr., Mr. W. Barrett) was an easy first prize winner with a superb collection, among which Zinnias, as double and as big as show Dahlias, were conspicuous. A collection of Roses, comprising some 4,000 blooms, in the perfection of form, were staged by Messrs. S. MCGREDY, The Royal Nurseries, Portadown, Co. Down, for which the society's large Gold Medal was unanimously awarded. Messrs. MCGREDY were easy winners in the class for twelve Roses, one variety, not exhibited prior to 1921 with "Admiration," and for twelve blooms of distinct varieties introduced since January 1, 1920.

Sweet Peas were plentifully exhibited and surprisingly good after the storm of the 2nd ult Lord ARDEE won in the champion class for Sweet Peas with 18 bunches distinct, in which he had four competitors. Viscount POWERSCOURT, Powerscourt, Enniskerry (gr., Mr. W. H. Lee), had the best 12 bunches. Fruit, with the exception of grapes, which seem to have had their day here, was well represented. forty dishes of Gooseberries, comprising three classes, were excellent, as were Currants in their classes. Good Melons were in evidence: the first prize fruit of a scarlet fleshed Melon, shown by Mr. C. PILGRIM, Luttrellstown, Clonsilla, was a grand specimen.

The vegetable section was unusually well filled, the Hon. A. E. GUINNESS, Glenmaroon, Co. Dublin (gr., Mr. W. Stevens), being first in five entries of 12 kinds, with superb examples, Lord ARDEE and Lord CLONCURRY, Lyons, Co. Kildare (gr., Mr. W. Hall), following closely. Non-competing exhibits, apart from the Portadown Roses alluded to, included a collection of Potatos from Viscount Powerscourt, admirably staged by Mr. W. H. LEE, for which a silver medal was awarded; trusses of a new seedling Tomato from Lord ARDEE, which received a certificate of commendation; vases of the beautiful Begonia balsamaeflora (Martiana?), set up by Mr. C. PALMER, gardener to the Earl of Iveagh, K.P., Farmleigh, Co. Dublin; and plants of Calceolaria alba from the DUBLIN NURSERY Co., Blackrock.

NORTH OF ENGLAND HORTICULTURAL AND BRITISH CARNATION.

THE combined exhibition of these two Societies was held at Harrogate on Wednesday, Thursday and Friday, the 22nd, 23rd and 24th ult. The show was a semi-municipal function, for it received the support of the Harrogate Corporation and the Harrogate Chamber of Trade. The exhibition was a great success, and is said to be the finest ever held in Harrogate. In addition to Carnations, there were fine exhibits of Hollyhocks, Orchids, Gladioli, hardy flowers and rock gardens.

In the Carnation classes Mr. C. ENGELMANN met with unusual success, winning no fewer than seventeen first prizes, including four challenge Cups and a Silver Medal in the open section; he won the North of England Horticultural Society's Gold Medal, the British Carnation Society's Gold Medal, the Cup presented by the Harrogate Corporation, the American Carnation Society's Cup offered for American novelties, and the Brunton Cup offered for British novelties. Mr. J. E. HATHAWAY, gardener to John Brennand, Esq., Baldersby Park, Thirsk, was also a prominent prize winner, for he was successful in winning first prizes in no fewer than eleven classes, and he won all the first prizes in the classes open to amateurs north of the Trent. Mr. T. PATEMAN, gardener to Sir J. Nall-Cain, Brocket Hall, won two first prizes and five second prizes. The exhibition was opened by the Mayoress, who was presented with a bouquet by Miss Mary Hall, daughter of the Rev. J. Bernard Hall. Mr. J. S. Brunton, chairman of the two Societies, presided at the opening ceremony.

Mr. C. ENGELMANN won first prize in the following classes: (a) seven vases of Carnations, twenty-five blooms of seven varieties; (b) three vases of twelve blooms each of British novelties distributed since January 1, 1920; (c) three vases of twelve blooms of American novelties distributed since January 1, 1920; (d) one vase of Carnations, not fewer than one hundred blooms of one variety; (e) one vase of Carnations, fifty blooms in three or more varieties; (f) one vase of crimson Carnations, twenty-five blooms, scent to be taken into consideration; (g) two boxes of thirty-six Carnation blooms, two distinct varieties, packed for market to illustrate methods of packing; (h) three vases of Carnation blooms, three distinct colours, twenty-five blooms in each vase; (i) one vase of white Carnations, twelve blooms of one variety selected from Classification List A; (j) one vase of light rose or deep pink Carnations, twelve blooms, one variety, selected from Classification List B; (k) one vase of salmon-pink Carnations, twelve blooms, one variety, selected from Classification List C; (l) one vase of red Carnations, twelve blooms, one variety, selected from Classification List D; (m) one vase of crimson Carnations, twelve blooms, one variety, selected from Classification List E; (n) one vase Carnations, twelve blooms, one variety, selected from Classification Lists F., G., or H.; (o) one vase of Fancy Carnations, twelve blooms, one or more varieties, selected from Classification Lists I, J, or K; (p) Silver-Gilt Medal awarded to the best vase in Classes 10 to 16 inclusive; (q) one vase of Carnations, twelve blooms, representing each of the twelve colour Classes A to L inclusive; and (r) one vase of Carnations, of apricot and yellow shades, twenty-five blooms. Mr HATHAWAY excelled in the class for a group of perpetual-flowering Carnations, in which the first prize was the Lord Howard de Walden Silver-Gilt Challenge Vase, together with £5 in cash. He was also successful in the class for (a) a decorative vase of Carnations; (b) one vase of white Carnations; (c) one vase of light rose or deep pink Carnations; (d) one vase of salmon-pink Carnations; (e) one vase of crimson Carnations; (f) one vase of Carnations selected from the Classification Lists F, G; (g) one vase of Fancy Carnations; (h) one vase or bowl of perpetual-flowering Carnations; (i) one vase or bowl of hardy perpetual border Carnations; and (j) the special prize of twenty-five Carnation plants for the best six vases of five blooms in sections B and C.

Sir CHARLES NALL-CAIN showed the best vase of Messrs. Stuart Low and Co.'s novelties and the best vase of red Carnations in the classes open to gentlemen's gardeners and amateurs.

The best decorated tables were shown by Mrs. J. S. BRUNTON, whilst Miss E. B. CAMPBELL, of Harrogate, won three prizes, including the Covent Garden Trophy in the florists' section. Messrs. STUART LOW AND CO. won a Silver-Gilt Medal and the Ogden Cup for a group of Carnations, whilst Messrs. K. LUXFORD AND CO. won the Whitehead Cup and a Silver-Gilt Medal, also for Carnations.

The following medal awards were made by the British Carnation Society. Gold Medals: to Mr. ENGELMANN and Miss CAMPBELL; Silver-Gilt Medals: to Messrs. K. LUXFORD AND CO.; Messrs. STUART LOW AND CO., and Mr. C. ENGELMANN; Silver Medal: to Messrs. ALLWOOD BROS. In addition the following special awards were made: Mr. G. W. HILL, gardener to Mr. H. Frankling, a medal presented by *Gardening Illustrated*; Mrs. WHITEHEAD (gardener Mr. W. Wilkinson), syringe presented by Abol, Ltd.; Mr. J. E. MAUNDER, a Silver Medal for border Carnations. An Award of Merit was granted to the new Carnation Vivienne exhibited by Messrs. W. BONSALL AND SON.

The following awards were made by the North of England Horticultural Society:—

Large Gold Medals: Messrs. DICKSON AND ROBINSON, for Dahlias, etc.; Messrs. G. GIBSON AND CO., for herbaceous flowers; Messrs. DOBBIE AND CO., for Dahlias; Messrs. JAMES VERT AND SONS, for Hollyhocks.

Gold Medals: Messrs. MANSELL AND HATCHER, for Orchids; Messrs. BACKHOUSE NURSERIES (YORK), LTD., for rock gardens; Mr. H. FRANKLING, Harrogate (gr. Mr. G. W. Hill), for Begonias.

Large Silver-Gilt Medals: Mr. J. THORPE, for fruit and flowers; Mr. E. J. PARSONS, for fruit.

Silver-Gilt Medals: Messrs. R. V. ROGERS, for Roses; Mr. ALVA HALL, for Ferns; Messrs. W. BONSALL AND SON, for Carnations; Mr. P. GARDNER, for rock garden; Messrs. KENT AND BRYDON, LTD., for herbaceous flowers.

Silver Medal: Mrs. WHITEHEAD, Harrogate (gr. Mr. W. Wilkinson), for a decorative group of Begonias, etc.

Large Bronze Medal: Messrs. DICKSON'S, for Roses and Carnations.

Bronze Medal: Messrs. BAKERS, for herbaceous flowers.

First-Class Certificate: Mr. ALVA HALL, Harrogate, for Campanula Hallii.

On the second day of the exhibition the Rev. J. Bernard Hall delivered a lecture on "Dwarf-growing Roses for cutting and fragrance suitable for Yorkshire."

Obituary.

G. F. Daniels.—The death occurred on August 22 at Norwich of Mr. George F. Daniels, for nearly thirty years manager of the vegetable and agricultural seeds and Potato departments of the well-known firm of Messrs. Daniels Bros., Ltd., of Norwich. Mr. Daniels, who had been seriously ill for some months, was the eldest son of the late Mr. George Daniels, the founder of the firm, and was widely known in the seed trade as well as among the citizens of Norwich, by whom he was held in high esteem. He leaves a widow and four children.

NEW HORTICULTURAL INVENTIONS.

LATEST PATENT APPLICATIONS.

19434.—Webb, J. W. — Turf-cutters, etc. July 30.

19097.—Andersen, M.—Machine for thinning out Beet plants. July 25.

19326.—Bedall, B. H.—Machine for separating seeds. July 27.

18628.—Carter, S. C.—Apparatus for mowing growth between planted rows. July 19.

18737.—Watkins, P.—Gardening implement. July 20.

SPECIFICATIONS PUBLISHED LAST MONTH.

201396.—Fletcher, A. J.—Apparatus for spraying Hops, fruit trees and the like.

200858.—Constable, A. H.—Implements for sowing seeds and distributing fertilisers and for cultivating and earthing up.

200581.—Clare, H. J. Newton.—Motive power unit for driving lawn-mowers and similar implements.

178467.—Rupprecht, Dr. G.—Process for treating plant cultures with sulphur.

200193.—Gorle, H. V.—Planting devices.

200354.—Martin, W. E.—Agricultural implement for splitting ridges.

ABSTRACT PUBLISHED LAST MONTH.

198242.—Manures: Brewer, G. W. S., Harting, Ethel Road, Broadstairs.—A dry or powdered fertiliser consisting of peat or peat refuse, peat soil or other soil derived from land which has been under cultivation, "killed" lime or chalk, and one or more fertilising agents such as phosphates, nitrates, potash salts, ammonia salts, soot or fish manure. The peat, soil and lime or chalk are mixed and allowed to stand for a few days, with occasional turning; the mixture is then dried, and, if necessary, disintegrated, and the fertilising agents are added. The manure is stated to introduce nitrifying bacteria.

This list is specially compiled for the *Gardeners' Chronicle*, by Messrs. Rayner and Co., Registered Patent Agents, of 5, Chancery Lane, London, from whom all information relating to Patents, Trade Marks and Designs can be obtained gratuitously.

Messrs. Rayner and Co. will obtain printed copies of the published specifications and abstract only, and forward on post free for the price of 1s. 6d. each.

ANSWERS TO CORRESPONDENTS.

CORRECTION.—In the reply to *T. R.* in last week's issue, the Mulberry is stated to belong to the Rosaceae; it is, of course, a member of the Urticaceae.

HARDY FLOWERS FOR MARKET: *A. C. G.* As you are evidently a beginner you should choose such easily-grown subjects for the present as Sweet Peas, Shasta Daisies, Stocks, China Asters, Gaillardias, Coreopsis, Sweet Sultans, Scabious, Statice, Antirrhinums, and Dianthus Allwoodii. Certain bulbs could be attempted, such as Tulips, Daffodils and Gladioli. The Tulips and Daffodils will furnish material early in the season and the Gladioli would be available in late summer. As you state your ground is in a warm, sheltered situation on a slope facing south you might sow the Sweet Peas in the autumn with a view to having them early in bloom. As you gain success and experience you would be able to enlarge the list, specialising in subjects which you found most saleable.

LEEKS AT A FLOWER SHOW IN JULY: *Constant Reader.* It is nothing remarkable to see Leeks in a collection of vegetables at a July exhibition. With regard to the time when Leeks are in season, although they are not usually available until the autumn, they would be in season as soon as they are large enough for use. Whilst the R.H.S. *Code of Rules for Judging* recommends certain points—in the case of Leeks a total of eight; for length of form 4, uniformity 2, condition 1, purity and cleanliness 1, respectively—there is no reason why judges should not reduce the pointing for the two last to one-half or even a quarter of a point; indeed, it is often necessary in close judging to adopt half-points in order to determine the winning exhibit.

MELON DISEASED. *H. W.* The Melon reached us in a state of decay and it was therefore impossible to determine the cause of the trouble. We think, however, the disease is not due to fungous attack.

NAMES OF PLANTS: *A. T. S.* 1, Billbergia, probably a hybrid, of which there are numbers; 2, Doryanthes sp., possibly D. excelsa; 3, Strelitzia reginae; 4, Eucomis punctata; 5, Prunus pumila; 6, Bocconia cordata; 7, Spartium junceum 8, Cerastium tomentosum. —*C. J. W.* 1, Hypericum patulum var. Henryi; 2, Acer Negundo.—*N. M. L.* Aesculus parviflora.—*Correspondent* and *Constant Reader.* We cannot undertake to name florists' flowers; send specimens to Carnation and Rose growers respectively.

NECTARINES FAILING: *W. A.* The Nectarine fruits arrived in a condition which made examination impossible. From the brief description given in your letter we believe the cause of the cracking is to be found in some error of cultivation rather than in the stock the tree is grafted upon. Sometimes, of course, the stocks may be at fault. Cracking may be caused either by an attack of green fly or of thrips just after the fruits have set; or by excessive and too early syringing in damp or very hot weather. Devote attention to these matters, and partially lift the roots in the autumn, adding more lime rubble to assist the fruits when stoning.

PEACH LEAF CURL: *J. N. M.* Your Peach leaves are affected with the fungus Exoascus deformans. This disease is always most in evidence when there is a sudden fall in temperature, and especially when cold winds prevail, but it is checked by an increase of temperature. The affected leaves should be removed, and burnt. Spraying the trees with Burgundy mixture just before the leaf buds burst is a preventive measure that has proved eminently satisfactory; the mixture is rendered more effective if three-quarters of a pint of milk is added to every three gallons, as this addition increases its adhesiveness.

PLUM LEAVES DISCOLOURED: *R. M. S.* The sooty appearance of the Plum leaves is due to the presence of a black mould caused by a fungus growing on honey-dew secreted by aphides. It would appear also that the tree is affected by Silver Leaf disease, but there is so much black mould present on the leaves that it is impossible to say definitely.

RENTAL OF GREENHOUSES: *F. H.* Without inspecting the premises it is not possible to arrive at a figure which would be a fair rental for the nursery, but assuming the rental to be £175 a year for the area and crops stated in your letter, we think it extremely unlikely that you would be able to make a good living from the establishment. Of course, if most of the produce could be retailed and the nursery leased on a lower rental it might be possible to make the place pay, provided the soil is good and you have an efficient knowledge of methods of cultivation.

SOIL FOR CARNATIONS: *H. C.* Use about two-thirds of fairly strong loam, that has been stacked some time, pull it to pieces by hand, and add a little fresh lime or lime rubble, with some ground oyster shells and ash from the garden bonfire. If the loam is of poor quality add an 8-inch potful of bonemeal to each barrow-load of compost; no other manure is necessary at potting time, as the plants may be fed later with a reliable Carnation manure.

CUT FLOWERS.

REMARKS.—There appears to be a gradual shortening up of supplies in this department, this being most noticeable amongst outdoor flowers, such as Asters, Stocks, Shasta Daisies and Gypsophila. No doubt the heavy rains during the past few days are accountable for the shorter supplies. Carnations are much shorter in supply, and their prices are advancing. Prices are also firmer for best Roses, but there are still plenty of cheap Roses. The quantities of Chrysanthemums are slowly increasing; white and yellow blooms are selling freely. The best sorts are Sanctity and the yellow Mercedes. Bronze varieties are only medium. Pink blooms are expected to be on sale this week. There is also a limited supply of spray bronze, whilst yellow and pink spray is of very poor quality. Good spray has yet to arrive. All Liliums are scarcer, and their prices are again on the up grade. A better supply of Lily-of-the-Valley is greatly welcomed, and other choice flowers are Stephanotis, Gardenias, Lapagerias and Bouvardias. Giant-flowered Gladiolus from home growers are arriving in first class condition, the white, scarlet and pink varieties being exceptionally fine. Similar sorts are arriving from Holland, but they are inferior and much cheaper. A small consignment of Physalis has arrived in the market; the spikes are very fine and well coloured. There has been a general advance in prices throughout this department during the last few days. Orchid blooms are practically unobtainable.

The Development Commission.

Year by year the Development Commission issues its reports* and each year shows more clearly both the wisdom of the politicians who brought about the establishment of the Commission and the energy and perspicacity of the Commissioners. It is doubtful, however, whether the reports are so widely read as they deserve to be. For this the price at which they are issued is perhaps in part responsible. Notwithstanding the high cost of printing, it should be possible to publish a pamphlet of one hundred and thirty-eight pages for less than three shillings and eightpence-halfpenny. It should, moreover, not be impossible even though the cost of publication were so high as to justify this price, to persuade the Treasury to allow of the issue of the Reports below cost price. For it is of very great importance that the nation should be aware of the energetic and sustained endeavours which are being made by the Commission to develop the natural resources of the country. One means of doing this would, we think, be by the issue of a summary of the substance of previous reports in a compact and handy volume. The work of the Development Commission covers wide ground and includes the fostering of rural industries, the promotion of research and enterprise in agriculture and horticulture, and the development of fisheries and harbours. The resources of the Development Commission have been greatly augmented by the "windfall" of £850,000, the administration of which was entrusted to the Commission by the Corn Protection Repeal Act of 1921. Of all the work undertaken by the Commission, that of promoting the development of rural industries is the most difficult. Until recently, this work was confined to assisting certain specific schemes, such, for example, as the growing of sugar Beet and Tobacco, and other special crops. But the Commission recognises that for the inquiry into the scope which exists or may be created for old and new rural industries, a permanent organisation is required. The Geddes axe destroyed the rural industries branch established by the Ministry of Agriculture, and it is therefore important that some permanent body should exist whose business it is to inquire into questions relating to this subject. As a preliminary to the work of encouraging rural industries, the staff of the Research Institute for Agricultural Economics has made a survey and inquiry into the rural industries round Oxford, the results of which have been published under this title in book form by the Clarendon Press, Oxford; price 7s. 6d. The district included in this survey covers an area round Oxford with a radius of thirty miles. The industries investigated were many and various—woodland industries, Osier cultivation, basket-making weaving, etc. One of the most interesting conclusions reached is that the village artisans, blacksmith, wheelwright, carpenter and saddler, might, with better organisation and with more resources, play a far larger part than they do at present in supplying local agricultural needs. No one who lives in the country will dissent from this opinion; for few people have not discovered that their desire to use local craftsmen is thwarted by the slowness with which the latter are able to accomplish the work given to them, and this not because of lack of good will or ability, but owing to insufficient resources of personnel and power. There is ample evidence that no small measure of success in encouraging rural industries has been achieved by other countries—as, for example, Germany—and that it has resulted in imposing a certain check to the drift of rural population into towns. The Report of the Commission points out that conditions in this country are not unfavourable to a like success, and cites, by way of example, the fact that the installation of electric light and power in the county district of Herefordshire has already resulted in a large increase in the work done by local wheelwrights. It makes, therefore, melancholy reading to learn that our county industries are at present largely derelict, and everyone will hope that the Rural Industries Intelligence Bureau, which has recently been established, may succeed in arresting the decay of rural enterprises, which should enable members of rural communities to maintain themselves even in the face of the present pervasive centralising industrial system. In their work of managing agricultural research, the Development Commission have a better charted course to steer, and all who read the Report will recognise that they have navigated it to good effect. Provision for research in animal diseases, than which no agricultural problem is more important, has occupied a good deal of their attention, and among newer projects is that of fostering research into questions relating to agricultural machinery. Perhaps the most interesting of the statements contained in the Report and relating to achievement is the one (p. 36) which claims that electrification of crops is likely to result, in certain cases, in increased yields amounting to 22 per cent. Should this prove to be the case, it will mean that a course has been discovered which brings this country a definite step nearer to the stage in which it may be self-supporting in foodstuffs. That ideal may be difficult to realise in its entirety, but, for our part, we refuse to believe that it is impossible. The economic side of the question is not within our province to discuss, but it must clearly be a legitimate aspiration of all those interested in the development of agriculture and horticulture that England, Scotland and Wales should be able, if the need arise, to supply the main bulk of the food consumed in these Islands. When overseas supplies are cheap, it may seem to pay better to buy in the cheap market, but if and when these supplies become short and dear, every ton of home-raised produce cannot but help both the farmers and the nation.

* Development Commission. *Twelfth Report.* Published by H. M. Stationery Office, London. Price 3s. 8½d.

Agricultural Scholarships.—The list of awards of scholarships to the sons and daughters of agricultural workers and others under the scheme established from the fund provided by the Corn Production Acts (Repeal) Act, 1921, for the development of agriculture, has been issued. Ten candidates have been granted scholarships for three or more years, tenable at university departments of agriculture, and nine students scholarships for two years, tenable at agricultural colleges. In connection with the scholarships for courses not exceeding one year, tenable at farm institutes or similar institutions, 89 scholarships have been granted; 56 to boys and 33 to girls, for short courses in agriculture, horticulture, dairying, etc. The parents or guardians of the candidates to whom scholarships have been granted include 21 agricultural workers, six working bailiffs, 25 smallholders, three market gardeners and six working gardeners.

Gordon Castle Woods.—About sixty of the members of the Moray and Nairn Foresters' Society recently paid a visit to the woods at Gordon Castle, the Duke of Richmond and Gordon's Scottish seat. Under the guidance of Mr. John Clark, head forester, the party were shown many interesting woods and young plantations, and at the close, Mr. E. S. Grant, Altyre, gave a short demonstration on squirrel damage. A committee was appointed to organise a campaign against these pests.

Critical Position of British Forest-Tree Nursery Trade.—The critical position of the forest-tree nursery trade in this country, owing to the activity of the German growers and the large number of nurseries now established and supervised by the Forestry Commission, is causing much alarm in what was once a very prosperous business. Discussing the subject, Mr. W. M. Gossip, Inverness, a well-known forest-tree grower, and the son and grandson of nurserymen, gives a very gloomy opinion of the future of the trade in this country. He declares forest-tree nurseries are dying out in this country, and he holds the Government is to blame. He contrasted the astonishingly prosperous German nurseries with those at home, and said the former were buying the latest and most up-to-date machinery, magnificent horses, and the heads of these nurseries all possessed fine motor-cars. These Germans have unlimited Polish labour at about 6d. per head per day, with the result that everything is in capital order, and their crops beautifully clean. He knew what he was speaking about, having resided for several lengthy periods in Germany, studying German methods, before and since the war. Then their own Forestry Commission, which is part of the Government of this country,

Digitized by Google

should have given home nurserymen the chance of growing the trees required for the afforestation of the country. The Forestry Commission could have fixed its own terms, and the home nurserymen could quite easily have supplied all the trees wanted. Were the home nurserymen guaranteed they would get Government orders, they could have afforded to take chances, had their ground worked properly, and installed new machinery. The Forestry Commission is working unemployment schemes for the Government, but this will not last long. Meanwhile, the German nurseries, by the help of their Government, are thriving, prosperous assets to the nation. He contended it was a short-sighted policy of a British Government helping to assist to strangle a home industry, and so, in a way, help the Germans, whose policy ever seemed to be the ruin of British industries. There is no doubt private traders here can grow, and do grow, as good plants or better and much more cheaply than any Government department ever will do. At present the trade cannot be sure of selling forest trees because the Forestry Commission is growing colossal quantities.

List of Potato Varieties.—The Board of Agriculture for Scotland has compiled a list of the names of all the known varieties of Potatos, together with their synonyms. It includes 1,300 names and states whether the varieties are immune from or susceptible to Wart Disease in all cases where such knowledge is available. The list should prove of considerable value to growers, and especially those who specialise in the production of seed tubers. Copies may be obtained on application to the Secretary, Board of Agriculture for Scotlond, York Buildings, Queen Street, Edinburgh.

Imports of Tomatos.—During the three months, April, May, and June, the total importation of Tomatos into this country was 33,903 tons, being 6,269 for April, 15,195 for May, and 12,439 for June. Of this large amount only 514 tons were received from Dutch sources. By far the largest quantity came from the Canary Islands, which sent us no fewer than 13,441 tons in May and over 6,000 tons in each month of April and June. Spain sent us a considerable quantity of Tomatos in June, but the amount, 2,058 tons, was considerably lower than in June, 1922, when the figure was 4,301 tons.

Railwaymen's Horticultural Exhibition at Southport.—An interesting and extensive exhition of produce grown by the members of the London, Midland, and Scottish Railway Company's Horticultural Society (Northern Section) was held in Victoria Park, Southport, on the 25th ult. The number of entries totalled 2,981, against 1,581 in 1922, when the exhibition was held at Crewe. Notwithstanding the inclement weather which has prevailed in the northern districts, the exhibits were of a particularly high standard of quality. The display was arranged in two large marquees, each 126 feet by 40 feet, while a tent 60 feet by 30 feet was devoted entirely to honorary exhibits. Amongst the vegetables fifty-nine entries of Peas were an outstanding feature, first and second prizes being won by the variety Gladstone. There were no fewer than nineteen collections of vegetables staged, and the one exhibited by Mr. Anderton, of Westhead, obtained the Oldfield Cup for the best collection in the show, while Mr. Bunn, Liverpool, and Mr. Hope, Crewe, obtained first prizes in other classes. Potatos were another fine feature, and for these the society offered £10 in prizes. Mr. A. Davies, Nantwich, won the Manchester cup for vegetables, while Mr. E. N. Baldwin, Ormskirk, was awarded the Brocklebank cup for vegetables grown entirely on the railwayside. The Bruce Ismay cup for flowers was won by Mr. Hughes, Penwortham, while the Williams cup for Roses was awarded to Mr. J. J. Pelvin, Crewe. The Bingham Bowl for Sweet Peas and Carnations was won by Mr. J. Brookshaw, Crewe, whilst Mr. A. Davies won the society's shield and silver medal for the highest aggregate of points in the show. The honorary exhibits included collections of Sweet Peas from Mr. Henry Eckford; Gladioli from Messrs. Lowe and Gibson, and contributions from Mr. Manson, Messrs. Brown and Sons, Messrs. Kerr and Sons, and Messrs. Vickers. Over 4,000 people attended the exhibition, but unfortunately the weather was bad.

Mr. William Henry Gostling.—Mr. Gostling was born at Tilmanstone, Kent, in 1862, and at the early age of thirteen years he developed a passion for Orchids, which at that time were becoming extremely popular. In order to study these plants and their cultivation he went to Sunbury House, Tunbridge Wells, where the Rev. R. Kinley had a grand collection and specialised in Phalaenopsis. From there Mr. Gostling entered service with Messrs. Hugh Low and Co., at Clapton, to take charge of the importations which the collector, Mr. Smith, was then sending from Java. His next appointment was to the Orchid Department at Kew with Mr. W. Watson, and many beautiful plants flowered under his care, some of them for the first time in England. In 1882 J. T. Peacock,

MR. WILLIAM HENRY GOSTLING.

Esq., of Sudbury House, Hammersmith, was spending large sums of money on Orchids and Cacti, and he invited Mr. Gostling to take charge of his Orchid collection. Few gardeners of to-day are able to realise what excitement there was then in the horticultural world when a new species was discovered. Orchids were almost a craze, and Messrs. Protheroe's Rooms and Mr. William Bull's exhibition, etc., were centres of enthusiasm. In those days Orchids were exhibited as something wonderful and new, hence the Sudbury House collection was often drawn upon for public and private exhibitions. The death of the owner caused this unique collection to be broken up, and although Mr. Gostling subsequently took charge of other collections, he never felt the same interest in the plants. Believing the enthusiasm for Orchids would pass, he devoted his experience and energies to the general management of country estates. In this occupation he has continued to the present time, and is now engaged in winding up affairs on the Upton House Estate, Nursling, Hampshire, the home of the late Col. Griffiths, with whom he was associated for many years.

Dahlias at Hyde Park.—To the lover of Dahlias the splendid display by the Victoria Gate, Hyde Park, gives considerable enjoyment and useful instruction in the treatment and effective arrangement of these very popular plants. All of the latest and finest varieties are present, and probably not fewer than one thousand plants have been used. The system of labelling is good, each label being clearly and deeply written, and placed in such a position that one can see at a glance the name required. Mr. Hay is to be congratulated on the arrangement and fine condition of his plants. In connection with these Dahlias a correspondent writes: "I have noticed a great favourite with the general public is the variety called Union Jack. Last year I visited a certain London park where there was a small but interesting border of Dahlias, and it was near this particular variety the public congregated. These Union Jacks were not quite true to type, as not only were the striped flowers present, but also occasional reversions to self-red. Now, it is quite correct and indeed proper the Union Jack should receive its just admiration and public attention, but when 'taking on the red' it is time the patriotic gardener cried halt! I saw no 'reds' in Mr. Hay's collection."

Mr. W. G. Lobjoit.—The many friends of Mr. W. G. Lobjoit, O.B.E., J.P., will be interested to learn of the marriage of his second daughter, Winifred Grace, to Mr. George Peach Johnson, M.A., younger son of Mr. E. S. Johnson, J.P., on September 1, at the Parish Church, Heston.

National Chrysanthemum Society.—As usual, the National Chrysanthemum Society's Floral Committee will hold its meetings at the Royal Horticultural Hall, and these will take place on the Monday afternoons of September 17, October 1, October 15, November 12, November 26, and December 10, commencing at 3.15 p.m., while on Thursday, November 1, the opening day of the Society's great exhibition, the Floral Committee will meet at the Royal Horticultural Hall at 11 a.m. Notice of intention to place new Chrysanthemums before the Committee should be sent to the Secretary, Mr. C. H. Curtis, 5, Tavistock Street, Covent Garden, W.C.

The Hampton Court Vine.—The Grapes produced by the Grape vine at Hampton Court are sold annually and the proceeds devoted to charitable purposes. The cutting of the bunches was commenced on Monday last, and the fruit sold at 5s. per pound, in baskets made by the blind members of St. Dunstan's Institution, for which 1s. is charged.

An Unusual Food.—According to the *Journal of the Royal Society of Arts*, swallows' nests are considered a great table delicacy by the Chinese, and a sumptuous Chinese dinner is not complete unless there is a dish of this palatable food. There are two kinds of nests, a white variety and a feathered variety, the latter having birds' feathers in the texture. The nests are obtained from the Malay Archipelago, including Borneo, Sumatra, Java, and the Philippine Islands. They are also found in other places, especially on the reefs or islets off the coast of Changpu. The popular belief that the nests are made from jellyfish or seaweed is said to be erroneous. The particular swallows' nests used are said to be rich in albuminous matter, the nitrogen content varying from 3.39 to 24.6 per cent.

Acreage of Hops.—The preliminary returns compiled by the Ministry of Agriculture show that the acreage under Hops in England was 24,890, compared with 26,450 acres in 1922. By far the greatest area devoted to Hops is in Kent, which has a total of 14,450 acres; Hereford is next with 3,890 acres, Sussex with 2,270 acres, Worcester 1,950 acres, and Hampshire 1,020 acres.

The Fruit and Vegetable Crops.—The effect of the dry weather on the fruit and vegetable crops is reflected in the list of prices published in the Agricultural Market Report issued by the Ministry of Agriculture. In the wholesale markets a week ago Sharpe's Express Potato averaged 160s. 6d. per ton, and King Edward 180s. per ton, as compared with 86s. and 111s. per ton respectively a year ago. In the Wisbech market the value of King Edward this year has been even more—£7 per ton, against £3 to

Digitized by Google

£3 10s. per ton at the end of August, 1922. Both Cabbages and Cauliflowers made good prices last month, Cabbages averaging 2s. 2d. and Cauliflowers 4s. 2d. per dozen, as compared with 1s. 11d. and 3s. 5d. per doz. respectively a year ago. The Scarlet Runner crop is very backward, and the average quotation last week was as much as 5d. per pound, compared with slightly less than 1½d. per pound last August. Prices for Carrots and Turnips are double the value obtained last year, and Vegetable Marrows, Lettuces and Cucumbers are also much dearer. The prices for Tomatos fell very considerably during the last week of August, but they are still about 20 per cent. higher than on the corresponding date of 1922. It is interesting to know that all salad vegetables are realising more than double pre-war prices. While such soft fruits as Gooseberries, Raspberries, Strawberries and Currants sold for more than double the prices realised in 1913 and 1914, they have been a little cheaper than they were last year. Cherries realised a good market, but probably the greatest increase is in the price of Egg Plums, which averaged in the last week of August 29s. per hundredweight, compared with 7s. 6d. per hundredweight a year ago. Apples are decidedly dearer than during August, 1922, the dessert varieties realising about 65 per cent. and cooking varieties about 85 per cent. more than last year, while the few Pears on sale are also realising very high prices.

Trial of Delphiniums at Wisley.—The Royal Horticultural Society will carry out, during the coming season, a trial of Delphiniums in their gardens at Wisley. Three plants of each variety should be sent to the Director, R.H.S. Gardens, Wisley, Ripley, Surrey (goods to Horsley Station, Southern Railway), on or before October 30. The necessary entry forms may be obtained on application to him.

Appointments for the Ensuing Week.—Monday, September 10: United Horticultural Benefit and Provident Society's meeting; Hove Horticultural Society's show (two days); Bath Gardeners' Society's meeting. Tuesday, September 11: Jersey Gardeners' Society's meeting. Wednesday, September 12: Royal Caledonian Horticultural Society's show (two days); Watford Horticultural Society's show; East Anglian Horticultural Society's meeting; Sheffield Chrysanthemum Society's meeting. Thursday, September 13: Wargrave and District Gardeners' Society's meeting; Metropolitan Borough of Bermondsey Flower, Fruit and Vegetable show (three days). Friday, September 14: Scandinavian Horticultural show at Gothenburg, Sweden (eight days); Newarthill Flower show (two days).

"Gardeners' Chronicle" Seventy-Five Years Ago.—*Culture of Tomatos.* We treat the Love-apple or Tomato here as follows:—In the first week in March we sow in pots filled with rich sandy mould, and, placing them in a Melon or Cucumber frame, water them. As soon as the plants appear in their second leaf we pot them off in rich mould, three in a pot. When the roots have filled the pots we shift them into larger pots, removing the smallest plant, and leaving only the two strongest. We then place them in a Vinery or Peach house and give them a good supply of water, sprinkling over head every morning. By the first week in May they will be ready to plant out between the wall trees on either a south or east aspect. In planting, remove the soil to the depth of a foot, and fill the holes up with rotten dung; then turn the plants out of their pots, plant them, and cover the dung over with the soil, dishing the latter so as to make it hold water. Nail up the plants, and water them once a week. As soon as they show bloom, remove all the "water-shoots" or laterals, and stop the first joint above the flower so as to set the first bloom. By stopping in this manner we get ripe fruit in the first week in July, and a regular supply throughout the season. This year we had them ripe in the last week in June. If frost sets in, cut off the green fruit and place it on a flue in a stove or Vinery, and it will ripen as well as on a wall. *Robert Draper, Newby Park, Thirsk. Gard. Chron., September* 2, 1848.

HARDY FLOWER BORDER.

SEDUM SPECTABILE.

IF this is not the handsomest of all the hardy Sedums, it is certainly the best of all the taller late-flowering species and varieties, and one that will always be esteemed for the bold masses of colour it presents throughout autumn. The large, flattish heads of chalky-pink, bristling with stamens—the happy hunting ground of the last of the bees and butterflies (see Fig. 50)—are attractive against the pale blue-grey of the ample and fleshy foliage, and it is a matter of opinion whether any of the varieties are an improvement on the type. In common with many others of the Telephium set, S. spectabile will flourish in a soil that would be considered too stiff and cold for most members of the genus, but a good border soil of average quality probably suits it best. Whilst it rejoices in sun, it does not object to partial shade, and it often succeeds wonderfully as a town garden plant.

FIG 50.—BUTTERFLIES ON A GROUP OF SEDUM SPECTABILE.

As it is a native of Japan S. spectabile is sometimes erroneously known as S. japonica.

SEDUM PULCHELLUM.

THOUGH one or two inferior species sometimes usurp its name, S. pulchellum is distinct enough and handsome enough to remove any doubt as to its identity. It is a late-summer and autumn-flowering hardy species from the States of Missouri and Virginia, and is almost unique among the genus in its preference for a cool, moist soil. The fresh, emerald-green, linear leaves, which are evergreen, are borne like those of the common S. reflexum on crowded stems, upright or semi-prostrate, and they are frequently tinted with red. Above these, to the height of about 6 inches, rise the leafy flowering stems, which terminate in a bold head of blossoms consisting of large, four-petalled, rosy-purple stars set closely on a 4-5 branched cyme. S. pulchellum is not only one of the most beautiful of its race, but it is of the easiest culture. Though preferring a free soil near water, it will often grow quite well in an ordinary cool border, and its late-flowering habit affords it an additional claim for popularity. Propagation is easily effected by division. *A. T. J.*

KNIPHOFIAS.

THE effectiveness and brilliance of Kniphofias in the scarlet border, or the mixed herbaceous border, during August and September is well known, and these striking autumn flowers should be largely grown for these purposes.

They are, however, even more effective when grown in large masses in the wild garden where they may be given prominent positions, as they are magnificent when in flower and in winter their dark green leaves are quite attractive. They revel in an open position in full sunshine, where their torch-like spikes are seen at their best and produce a wonderful blending of yellow, orange and scarlet with a soft "bloom" thrown over these brilliant shades. Planted in bold groups their effect is visible from a long distance, so that they are plants of much value to the landscape gardener.

K. aloides and the varieties grandis, nobilis and longiscapa are all particularly handsome, and well worth growing, as also are many of the hybrids such as Obelisque and Ophir, which have handsome yellow and orange spikes of flower 6 feet or 7 feet high. There have been many varieties of Torch-Lilies introduced during the last twenty years, but probably seventy per cent. of them are traceable to K. aloides, itself a plant capable of yielding very fine effects either planted in quantity, alone, or grouped with other suitable vegetation.

Kniphofias grow well in a good, medium, sandy loam and appreciate liberal, annual top-dressings of manure. The soil should, however, be well drained, as, although these plants like plenty of moisture during the summer, anything approaching stagnant moisture at the roots is inimical to them, and is frequently the cause of losses during the winter.

Kniphofias may be increased by division in the spring, but it is not wise to disturb the old plants more than is really necessary. Seed is produced fairly freely from the bases of the earlier flower spikes, and affords an additional means of propagation. *W. Auton, Pyrford Court Gardens, Woking.*

PAEONIA WITTMANNIANA.

THIS charming, creamy-yellow Paeonia, one of the prettiest and most delightful species, was for long considered difficult to bloom, but this opinion appears to be gradually passing away, and it is now frequently seen in flower. It has flowered well in several gardens I have visited within late years, and seeing it in bloom in one of these gardens induces me to pen a note reminding others of this charming, single Paeony. It seems to grow best in a light, but rich soil, and a sunny place. *S. A.*

The Week's Work.

THE FLOWER GARDEN.

By C. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Tall Flag Iris.—Where these have not yet received attention, another month is available for the work of planting. Beside the flower border proper, spare ground between shrubs offers a suitable planting place, also open spaces by woodland walks. For extensive plantings it may be preferable to allow but one colour to a group or position. These Irises should not be grown in dense shade.

Pentstemon Cuttings.—The first half of September is the best time in which to root cuttings of Pentstemons, but it is not always possible to secure them at such time, as in hot, dry seasons growth is backward, and one must perforce wait until the cuttings can be had. These remarks apply in particular to one-year-old stock—two-year-old plants having a goodly number of shoots available for inserting now. The cuttings may be dibbled in sandy soil in frames, boxes, or pots. Frames are an advantage if the cuttings are spaced a fair distance apart, inasmuch as the plants may remain undisturbed until planting-out time; whereas, when put in thickly, repotting or transplanting is necessary.

Alterations.—Before the season is too far gone, make notes of suggested improvements, colour arrangements it may be desirable to retain or dispense with, plants to be divided or discarded, and any fresh plant or idea seen or heard of elsewhere which it is intended to have or adopt next year. One's memory may be very good, but often at the particular moment the name of the plant or shrub required cannot be remembered.

PLANTS UNDER GLASS.

By JOHN COUTH, Assistant Curator, Royal Botanic Gardens, Kew.

Dalechampia Roezliana.—This attractive stove plant, with its rich rose-coloured bracts, is worthy of more general cultivation, as it flowers over a long period. If propagated from cuttings at this time, good, useful plants may be obtained for flowering next year. It thrives in a compost consisting of equal parts of loam, peat and leaf-mould, with sufficient sand to render the mixture open and porous. This plant needs watering very carefully and the pots in which it is grown should be provided with plenty of drainage material. There is a variety with white bracts.

Desfontainea spinosa.—Although hardy in the west Desfontainea spinosa requires the shelter of a cool greenhouse in the colder parts of the country. It is not suited to pot cultivation, but does well planted out in a bed or border in a conservatory. Its tubular, scarlet and yellow flowers are produced over a long period; and the plant always attracts attention from its resemblance to a Holly. It may be propagated at this season by means of half-ripened shoots, which root readily under a bell glass in a cool house or cold frame.

Violets.—Frames should now be prepared for Violets: those that have been used for growing early vegetables are suitable for the purpose, for beyond adding some soil to bring the plants well up to the glass they should require nothing else in the way of preparation. The plants that are to be lifted should be thoroughly soaked at the roots the previous day. After being planted they should be well watered, and kept close and shaded for a few days. When established they should be kept well aired on all favourable occasions, removing the light entirely during fine weather.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

Late Grapes.—It being essential that the berries of late Grapes should be well coloured by the end of this month, plenty of air should be admitted to the house, both night and day, whenever the climatic conditions are favourable. Artificial heat may be dispensed with on bright, sunny days, but during dull, sunless weather and at night sufficient fire heat should be used to maintain a fairly dry atmosphere. Adequate supplies of water should be afforded the roots, with occasional applications of liquid farmyard manure, or an approved artificial manure. Clear soot water has a beneficial effect, both on the foliage and the colouring of the berries. Watering should be done early in the morning, in order that the atmosphere of the house may become fairly dry before night. Pinch all laterals at one leaf, and do not allow the growths to become unduly crowded and confused before undertaking this work. It is of importance that the foliage be maintained to

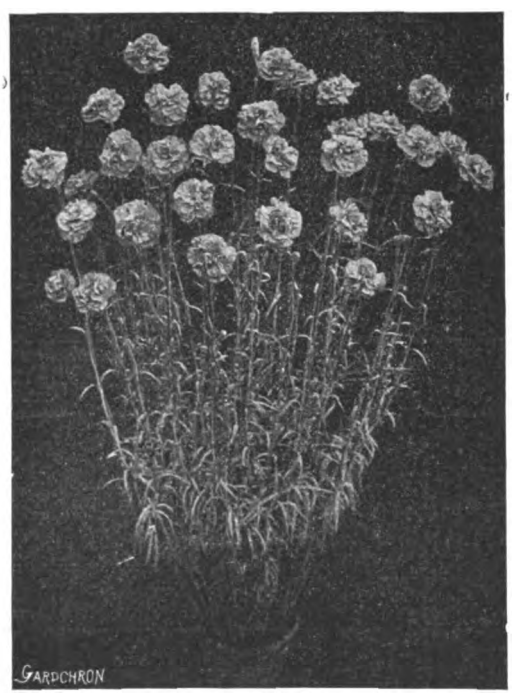

FIG. 51.—CARNATION LADY HERMIONE (SEE P. 143).

the latest period of the autumn if the fruit is expected to ripen properly. Leaves of good texture that remain green and healthy during the last stage of ripening always ensure good quality in the Grapes, provided a temperature of 60° to 75° is steadily maintained.

HARDY FRUIT GARDEN.

By A. J. HARTLESS, Gardener to Major J. F. HARRISON, King's Walden Bury, Hitchin, Hertfordshire.

General Remarks.—Currants have hung well and given a useful supply over a long period. Branches suffering from "die-back" should be removed and burnt. Strawberries shorn of their old leaves will now be making growth, and should be encouraged to develop by keeping the surface of the ground well tilled. Plums are ripening fast, and will need protection from birds and wasps. We have had to pick Beauty of Bath and other early Apples on trees difficult to protect before they were quite ready, because of the damage by these pests. It may be advisable to retain Peach fruits badly attacked by earwigs as a protection to those not interfered with. These fruits, too, will now be ready to pick. In removing these, firm but gentle and equal pressure with the hand must be used. American Brambles are bearing heavily, and the fruits may be utilised for dessert as well as for jam-making.

THE KITCHEN GARDEN.

By R. W. THATCHER, Gardener to MARK FIRTH, Esq., Carlton Park, Market Harborough, Leicestershire.

Turnips.—Turnip seed may now be sown fortnightly to produce roots for use during the autumn and winter. If the later sowings do not mature, they will withstand the winter if the weather is not very severe, and give a useful crop of greens in the spring. Thin the seedlings as soon as they are large enough to handle, and dust them with wood ash. Keep the ground well stirred between the rows. The old Green-top Stone and Veitch's Red Globe are two good varieties to sow for winter crops, whilst Sutton's Snowball and Dobbie's Model White are two excellent sorts for summer and autumn use.

Lettuces.—Keep the soil between Lettuce plants well stirred with the hoe to promote a quick growth, and thin them out to 6 or 8 inches apart. Small, quickly maturing varieties, such as Commodore Nutt, Sutton's Little Gem, Nonsuch, and Golden Ball, are best for autumn sowing. Some of the thinnings may be transferred to cold frames or houses, and, if kept well watered, these will prove useful if frosts damage those outside.

Globe Artichokes.—The heads of Globe Artichokes will have all been cut by now, and the plants may be trimmed, the ground about them forked over, and a liberal dressing of well rotted manure placed around the plants.

THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

Sobralia.—Any plants of Sobralia that require potting on or dividing should be attended to just when new growth is developing, which will be soon after the plants have flowered. Being strong feeders, the compost for these Orchids should be of a retentive nature, and may consist of three parts good fibrous loam to one part each of peat and leaf-mould from which all the finer particles have been removed. The whole should be thoroughly mixed and a liberal supply of fine crocks and coarse sand added. Good drainage should be afforded, filling the pots at least one-third of their depth with drainage material, over which should be placed some of the rougher portions of the material to prevent the finer material washing down into the drainage and clogging it. Pot firmly, keeping the compost below the rim of the pot. Large specimens that have exhausted the compost should be carefully pulled to pieces, taking every care to preserve as many as possible of the live roots, as Sobralias resent root disturbance. The outer portions of the specimens broken up will always be found to be the most vigorous, and are the best pieces to use if it is desirable to rebuild a specimen or to place into small pots to increase the stock. When the plants have been overhauled, it is advisable to remove all the growths that have produced flowers, and restake the remainder, which will produce flowers next season. A position in the intermediate or Cattleya house will be found very suitable for these Orchids. They require frequent spraying overhead, and under their leaves, to prevent attacks of red spider and thrip, which they are liable to, especially if they are grown in a dry place. Those that have been divided should be kept well shaded for some time and sprayed freely, but water must be applied to the compost sparingly until the young roots are well established. Plants that have not been disturbed and are well rooted will be aided by being kept well supplied with water and an occasional watering with weak liquid manure will be beneficial, reducing the supply when the days are short and the light deficient. Although the individual flowers of Sobralias are short-lived, a batch of well-grown plants is a fine feature, especially in large houses, and the short life of the individual flower is compensated by the numbers produced on their reed-like stems. One of the greatest mistakes made in the cultivation of these plants is that of growing them in a hot, stuffy atmosphere.

FLORISTS' FLOWERS.

CARNATIONS.

ALL through this has been an unsatisfactory year for Carnations. It was too humid for them in spring, causing rust, too dry in summer, and when the primary flowers were open they were spoiled by humble bees, scarcely a flower escaping their attention. There are, however, the later blooms to look forward to. A curious circumstance about the Bombyces is that flowers of Dianthus Allwoodii have not been interfered with. Can the scent have been too strong for them? Of these this is the first year that Phyllis has done well, and only two-year-old plants. So that it may be worth while to treat this variety as a perennial. Thus treated it proves to be one of the best, alike in form and colour. Arthur proves to be very like Rufus, more refined and with a brilliant eye, but the latter will take a lot of beating, so free is it, and so striking in the mass.

The long season of flowering of Dianthus Allwoodii must not be overlooked; in mild winters they will continue blooming when most other flowers are over.

I am informed the varieties of Dianthus Allwoodii are not so floriferous as growers have been given to understand them to be. But that I think is due to the treatment given. In a previous note, I pointed out what I consider an essential, viz., that recently established plants from cuttings should be pinched hard back, when several growths will break, with the result that the plants will produce flowers in abundance. Unstopped specimens have not time to do so. Concerning Carnations, there is still a great number of shy-flowering, drooping-headed varieties in cultivation. No doubt at least a few of these may yet claim room for some special feature they possess, but the improved upright type, almost perpetual in its flowering qualities, is so much superior, that once seen, the former can have no chance of being kept. Of course, gardeners are not so particular about form as the florist purist, and some of the older kinds of the latter will no doubt appeal more strongly to them than others. For instance, fine as Gordon Douglas is as a crimson, for purely border work it may be less valuable than Surrey Clove, and I have heard Bookham Clove, from the same point of view, preferred to either. Of all, for effect, the scarlet Grenadier stands supreme. Moreover, unlike so many of a similar colour, the flowers do not burn, or whatever word may express the peculiar fading of colour that mars their beauty even when shaded. Then for a floriferous, well-scented variety, a high position must be accorded to Mrs. A. Brotherston, a sort which must remain a standard for many years. Of whites, never a very satisfactory section, Sir Galahad is perhaps as good as any. Sir Douglas Haig, for those who like the style of flower, is good, and the fancy Dom Pedro, should it not be outclassed by Bookham Rose, is simply indispensable in a collection of these flowers.

Fancies as a rule do not succeed as border sorts, but the old Linkman may be grown with satisfaction. Border Yellow is well known for its general good qualities, and though Marshal Neil is a deeper and purer yellow there is room for both, and even for the very old Miss Audrey Campbell, which is cream rather than yellow. The pink My Clove has done better than usual this year.

Lady Hermione (Fig. 51) is probably unsurpassed in its colour. Here it has never done very well, owing to a weakness in constitution, and it has the fault of being soon over. For many years a seedling of similar colour and continuing much longer in flower has been grown along with it. The latter is of the same dwarf habit as Bookham Clove, Sweetheart, Blush Clove, and, I think, Kelso, with its unique colouring. It is equally as Clove-scented as any, and scent is an attribute looked for in these flowers.

Other sorts I like are Dora Blick, Innocence, Opalescence, Purple Clove, Salmon Clove, apparently the best of the colour, Grey Douglas and Melanie, which is very fine. However, Carnations, like many other garden plants, exhibit strange likes and dislikes. Some very fine varieties, *e.g.*, Lieutenant Shackleton, are of no value as borders, but produce lovely blooms grown in pots. An old yellow-ground Picotee which Mr. Douglas informs me is Mabel, is quite indispensable, especially as a cut flower. It is otherwise interesting as showing the kind of flower that satisfied a bygone race of florists. *R. P. Brotherston.*

FIG. 52.—GLADIOLUS ALICE TIPLADY ARRANGED WITH GYPSOPHILA.

THE GLADIOLUS AS A DECORATIVE CUT FLOWER.

THE value of the Gladiolus as a decorative garden flower has been realised for many years, but, chiefly owing to its size, it has never been seriously considered as having any particular merit as a cut flower for indoor decoration. However, the improvement of the primulinus hybrids has now, to a large extent, removed the disadvantage of unwieldiness possessed by the Gandavensis section, though the latter type still holds a very high place in decorative schemes on a large scale, such as ballrooms.

The main points in favour of the primulinus hybrids are beauty of colouring, and shape of flower, gracefulness of spacing of the blooms on the spikes, and slenderness of the spike itself.

In glass bowls, with Gypsophila, the spikes may be arranged quite easily, to give a very beautiful effect. The straight, stiff, sword-like spike of the Gandavensis, with its mass of closely set flowers, does not show to advantage and, should any spike come away from the perpendicular to any degree, the whole beauty of the flower is lost. With the primulinus hybrids it is different; the graceful curves of the slender spikes and the peculiar shape and placing of the flowers themselves, both lend beauty to a bowl. The accompanying illustration (see Fig. 52), shows the variety Alice Tiplady, arranged in this manner. This variety was introduced by Kunderd, in 1915, and became an immediate favourite, with its beautiful orange-saffron colour and large, well-shaped flowers. Of the smaller-flowered varieties, perhaps, the best is Nydia, whose beautiful rose-coloured blossoms are among the finest decorative flowers grown.

August and September often present difficulties in the way of indoor floral decoration, which these primulinus hybrids go far to overcome. The initial outlay is not great, the flowers themselves are no trouble to grow, and their beauty and value for autumn decoration will be readily realised by all who cultivate them. *G. M. C.*

[Our correspondent does not refer to the value of the smaller-flowered varieties for floral decorations indoors. These, however, are exceedingly beautiful, and the variety The Bride has been sold in large numbers during the past month or so in Covent Garden market for the special purpose of indoor decorations. The spikes are very elegant and the blooms remain fresh for a considerable time. *Eds.*]

The Week's Work.

THE FLOWER GARDEN.

By C. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Tall Flag Iris.—Where these have not yet received attention, another month is available for the work of planting. Beside the flower border proper, spare ground between shrubs offers a suitable planting place, also open spaces by woodland walks. For extensive plantings it may be preferable to allow but one colour to a group or position. These Irises should not be grown in dense shade.

Pentstemon Cuttings.—The first half of September is the best time in which to root cuttings of Pentstemons, but it is not always possible to secure them at such time, as in hot, dry seasons growth is backward, and one must perforce wait until the cuttings can be had. These remarks apply in particular to one-year-old stock—two-year-old plants having a goodly number of shoots available for inserting now. The cuttings may be dibbled in sandy soil in frames, boxes, or pots. Frames are an advantage if the cuttings are spaced a fair distance apart, inasmuch as the plants may remain undisturbed until planting-out time; whereas, when put in thickly, repotting or transplanting is necessary.

Alterations.—Before the season is too far gone, make notes of suggested improvements, colour arrangements it may be desirable to retain or dispense with, plants to be divided or discarded, and any fresh plant or idea seen or heard of elsewhere which it is intended to have or adopt next year. One's memory may be very good, but often at the particular moment the name of the plant or shrub required cannot be remembered.

PLANTS UNDER GLASS.

By JOHN COUTH, Assistant Curator, Royal Botanic Gardens, Kew.

Dalechampia Roezliana.—This attractive stove plant, with its rich rose-coloured bracts, is worthy of more general cultivation, as it flowers over a long period. If propagated from cuttings at this time, good, useful plants may be obtained for flowering next year. It thrives in a compost consisting of equal parts of loam, peat and leaf-mould, with sufficient sand to render the mixture open and porous. This plant needs watering very carefully and the pots in which it is grown should be provided with plenty of drainage material. There is a variety with white bracts.

Desfontainea spinosa.—Although hardy in the west Desfontainea spinosa requires the shelter of a cool greenhouse in the colder parts of the country. It is not suited to pot cultivation, but does well planted out in a bed or border in a conservatory. Its tubular, scarlet and yellow flowers are produced over a long period; and the plant always attracts attention from its resemblance to a Holly. It may be propagated at this season by means of half-ripened shoots, which root readily under a bell glass in a cool house or cold frame.

Violets.—Frames should now be prepared for Violets: those that have been used for growing early vegetables are suitable for the purpose, for beyond adding some soil to bring the plants well up to the glass they should require nothing else in the way of preparation. The plants that are to be lifted should be thoroughly soaked at the roots the previous day. After being planted they should be well watered, and kept close and shaded for a few days. When established they should be kept well aired on all favourable occasions, removing the light entirely during fine weather.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

Late Grapes.—It being essential that the berries of late Grapes should be well coloured by the end of this month, plenty of air should be admitted to the house, both night and day, whenever the climatic conditions are favourable. Artificial heat may be dispensed with on bright, sunny days, but during dull, sunless weather and at night sufficient fire heat should be used to maintain a fairly dry atmosphere. Adequate supplies of water should be afforded the roots, with occasional applications of liquid farmyard manure, or an approved artificial manure. Clear soot water has a beneficial effect, both on the foliage and the colouring of the berries. Watering should be done early in the morning, in order that the atmosphere of the house may become fairly dry before night. Pinch all laterals at one leaf, and do not allow the growths to become unduly crowded and confused before undertaking this work. It is of importance that the foliage be maintained to

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters, and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS.—*The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 5, Tavistock Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

LITTLE KNOWN METHODS OF KEEPING APPLES.

MOST gardeners desire to keep Apples as late as possible in order to furnish the establishment with fruit at a time when there are very few other kinds of fruits available from the garden. But not all are equally successful in keeping Apples, and in many cases the fruits are apt to shrivel in the fruit room and lose their qualities long before the time when they decay naturally.

A few seasons since I saw several methods adopted in experimenting with Apples for long keeping, and specimens brought to my notice were sound and of first-rate flavour. Tubs holding about 56 lb. to 70 lb. of Apples were prepared as follows:—A layer of dry sand was placed in the bottom of the tub, and the fruits, after being wiped with a dry, soft cloth, were arranged in a layer on the sand. More sand was placed in the tub—small reddish sand and very dry—and the packing of the fruit was continued in layers until the top one was within 2 inches of the rim of the tub, when the work was finished by adding a final layer of sand. The tubs were then placed in an old summer-house where it was quite cool, but perfectly dry. When the fruits were seen by me in July, the varieties being Cox's Orange Pippin and Court Pendu Plat, they were in good condition. Another method adopted was to line deep boxes with Oak leaves and cover the fruits with the leaves as in a nest, after first seeing that they were wiped perfectly dry. This method answers satisfactorily, and splendid fruits of Ribston Pippin were shown to me, taken out of the leaves at the end of May. This system of storing seems to follow Nature's method of keeping Apples, and apparently the leaves assist in retaining the qualities of the fruit for a very long time.

Another plan was to leave a quantity of the fruits in a heap in the orchard and to cover the latter with fallen Apple leaves, which were retained in position by small-meshed wire netting. In this case the variety was Dumelow's Seedling (Syn. Wellington), and the fruits stored in this way remained perfectly sound until the end of June.

One of the best late dessert Apples is Sturmer Pippin, but many growers make the mistake of gathering the fruits of this sort too early. This very desirable late Apple should be allowed to hang on the tree until very late, and then it will retain its crispness to the end. By thoroughly ripening the fruits the yellow flesh of this excellent Apple develops its finest qualities, and such fruits will remain sound until the end of July. The tree makes a good standard for orchard cultivation, and the variety also does well in bush and espalier form. It is one of our most valuable late Apples, although its appearance is not so taking as some of our late sorts. Australian and Tasmanian growers cultivate this variety extensively for the English market, and fruits sent several thousand miles by rail and sea arrive here in the pink of condition; in some cases not a single fruit in the box shows the least blemish or any injury by pressure on the box. Fruits of Sturmer Pippin from Australian sources realise high prices, for they are in great demand, not only for their beautiful appearance, but also for their excellent quality. It is probable that with a climate hotter than in this country Sturmer Pippin does even better in Australia and Tasmania than with us.

Other varieties that may be recommended for late keeping are Lodgemore Nonpareil, a fruit of medium size, roundish ovate in shape and regular in outline; the skin is golden yellow, slightly flushed on the side next to the sun; the flesh is yellowish, firm, crisp, and sweet, with an abundance of juice and a fine aroma. Some years ago I saw a tree of this variety in the Stroud district, and I wondered why this fine Apple is not more extensively cultivated. This Apple is sometimes known as Clissold's Seedling.

Wanstall, known also as Jack-in-the-Wood, is another very useful late Apple. It is said to have originated with a tailor named Wanstall, near Sittingbourne, Kent. Specimens were sent to me for naming, some five years ago, in the month of May, and the fruits attracted me at once. They are of medium size, round, with prominent angles on the side; so far as I can recollect, the number was five, making the fruit five-sided, with ribbing as pronounced as in Winter Quoining. The skin is deep golden yellow, with red and crimson striping next to the sun, and with patches of russet and grey dots. The stalk is half an inch long and deeply inserted; the flesh is yellow, crisp, and sugary, and very finely flavoured, and I consider it superior in quality to Ribston Pippin. I hope to come across this variety again, as I wish to obtain a few grafts; none of the fruit lists I have at hand offer this old sort.

Apples intended for "laying down" should be sound and of firm texture. When the fruits are removed for use, they should be wiped thoroughly and exposed as little to the air as possible before being placed on the dessert table, as they soon lose their flavour, whilst exposure to the air makes them pithy and discoloured. As the season for harvesting Apples is approaching, those who wish to prolong their season of Apples for, say, six weeks to a couple of months should try the tub and sand method of storing late sorts in the case of both dessert and culinary varieties. *Pomona.*

PROPAGATION OF ALPINE RHODODENDRONS.

I PREFER to commence the propagation of Alpine Rhododendrons throughout August and continue during September. Some of the older plants were ripening their growth at the end of August, and have plumped up their flower buds for next year, but others, especially young plants, are still growing and sappy enough to offer ideal cuttings.

The plants may be propagated in an ordinary small frame placed in semi-shade, and wherever it be situated see that the ground on which it is placed is thoroughly drained. Over the drainage material place the coarser material found in the compost bins, to form an under-layer for the rooting medium. Of the latter 80 per cent. should be sand of a nature that will not set hard, merely toned down with fine loose peat, leaf mould and light loam; make this more than moderately firm, to the depth of six inches, with the surface level from 18 to 24 inches below the light.

Scarcely any skill is required in the selection of the cuttings, for the natural growths of the plants in the course of the season are generally of cutting size only; a piece of last year's wood will often have several shoots suitable for the purpose.

The cuttings are simply made by an oblique cut below the junction of the desired cutting with the old wood; remove enough leaves to allow for insertion. Reject cuttings that are terminated with flower buds, but if such growths are needed, the flower bud should be removed in the process of making the cutting. The stocks of these plants are all too small, and the propagator has to make the best of his limitations, and use whatever cuttings are available. Curiously enough, in many cases thin and small unorthodox cuttings root and thrive the best. The cut may be made below or at a node, for roots are emitted from any part of the stem below ground.

If frame accommodation is not needed owing to the small supply of cuttings, use 4 inch or 5 inch pots, insert the cuttings, plunge the pots to the rims in ashes or fibre, and cover each pot with a bell-glass, but not for long, only a fortnight or so; in fact it is questionable if the glasses are of any real assistance in frames, except that they keep out drip. I do know they are a great nuisance, and I believe the difference in the percentage of rooted cuttings with or without their use would be negligible.

Insert the cuttings either in the frame or the prepared pots, closely enough to touch each other; make them firm with a neat hard-wood dibber, by the pressure of a half-twist action of the wrist, and not by a pointed thrust. Thoroughly water in the cuttings and never allow the compost to become dry. Cover the frame with the light, and keep it close; subsequent attention to shading during bright weather is necessary, but the shading material should be removed early enough in the afternoon to allow sufficient sun-heat to enter to keep the frame warm during the night. In bright and dry weather, create a moist atmosphere by repeated mist-like sprayings.

As the cuttings form roots, accustom the plants to increased ventilation, but protect them from severe frosts. Do not pot the rooted cuttings before growth takes place early in the following spring, for it is better to plant them then in a rough frame from which the light may be entirely removed when necessary.

During the cutting stage keep a sharp watch for dead and decaying leaves; examine the batch methodically, and remove every medium of fungus infection. I would warn growers against the placing of cuttings from outdoor plants in heated propagating pits; more than once I have seen batches of cuttings inserted in the best of material with minute care, and yet all succumbed. However, I have a good word to say in favour of potting up stock plants in the early autumn, placing them in a propagating house and gently forcing them into growth in the early spring, when cuttings an inch long may be obtained, and these will root readily to the extent of 90 per cent., either placed inside the heated propagating frame, or under bell-jars on the stage. But the results will be far from satisfactory if the plants are in the house in mid-summer, and cuttings are tried in the same manner as suggested in these notes.

The above remarks apply to such Rhododendrons as R. impeditum, R. intricatum, R. hippophaeoides, R. parvifolium and R. flavidum, but there are many others in the Lapponicum group, such as R. scintillans, R. orthocladum, R. nigro-punctatum, R. rupicolum, etc., which I feel sure would root readily if treated in the manner described. *C.*

PLANTING EVERGREENS.

WHILST "doctors may differ" as to whether evergreens are better planted in autumn than spring, or vice versa, there is no doubt but that the winter planting of such subjects every year brings loss and disappointment to the many novices who practise it.

Personally, I prefer planting in September to any other time, with the sole exception perhaps of certain Conifers, which seem to move better just when their spring growth is beginning. Then there are, of course, the more tender subjects. Most of us would prefer to leave these in the nurseryman's hands, or at any rate in their pots, so that they may be given shelter, if necessary, until April or May, rather than plant in autumn with all their first winter out of doors ahead of them.

But with these reservations September is the time for planting evergreens. The very fact that the ground is warm, and therefore conducive to immediate and vigorous root activity, is alone a substantial argument in favour of this month for such work. But there are other factors also to be considered, and one of these is the humidity of the atmosphere that prevails from this time onwards to winter, which means that the exhaustive evaporation which usually tells so heavily against the transplanted evergreen is reduced to a minimum under normal conditions.

Some consideration must, however, be given to the nature of one's soil in such matters, and it will often be found that those who advocate spring planting have a colder, heavier medium to work with than those who, enjoying a freely-drained land, prefer to do this work in autumn. Evergreens planted in the former medium in spring would naturally be less likely to suffer from an early summer drought.

Where large-leaved evergreens, and such subjects as Hollies and choice Rhododendrons, appear to be suffering from undue transpiration after planting, it will often be of the greatest assistance to remove a considerable proportion of the leaves. But this should not be necessary at the present season, save where the roots have suffered considerable disturbance and injury. *A. T. J.*

LATHYRUS ODORATUS ZEYLANICUS.

THE SWEET PEA OF CEYLON.

THE interesting discussion of the problem of the "Sweet Pea of Ceylon" by Mr. S. B. Dicks, in the *Gard. Chron.* of June 30, 1923, which treats the subject exhaustively from, one might say, the European standpoint, prompts me to offer a few suggestions on this question from the Ceylon aspect.

The Dutch held only the coast districts of Ceylon. Their rule did not extend to the interior—the hill region—which was in the hands of the Kandyan Sinhalese, who were always hostile to, and frequently at war with the Dutch invaders. Hence Grimm, Hermann, Hartog, and Thunberg could botanise only in the neighbourhood of the coast. Now, the Sweet Pea will not grow in the low-country of Ceylon, nor at Peradeniya (1,600 feet). It grows well at Nuwara Eliya (6,200 feet), and more or less successfully from about 4,000 feet upwards. But Hartog, who is supposed to have gathered the Sweet Pea in Ceylon, could not have had access to any district of Ceylon in which the Sweet Pea will grow at the present day. Consequently, it does not appear credible, assuming the specimen was correctly named, that Hartog could have collected the Sweet Pea in any garden in Ceylon.

The specimen collected by Blume in Java (1822-26) may not afford a parallel. By 1820, the British were in possession of the hill districts of Ceylon, and were cultivating European flowers and vegetables there. Hence it would have been quite possible that at that date a specimen of the Sweet Pea might have been collected in Ceylon. Similarly, there are hill stations in Java; and, before the Javan example can be accepted as tending to confirm the Ceylon record, it should be ascertained whether these hill stations were available in Blume's time.

The botanists who visited Ceylon in the Dutch era came *via* the Cape. They collected plants in that country, as well as in Ceylon, and their collections were not always kept separate. Confusion was no doubt unavoidable under the meagre facilities for travel in those days. Linnaeus' *Flora Zeylanica*, which was an account of Hermann's Ceylon plants, includes Bobartia indica L. and Gnaphalium indicum L., both Cape plants; and Hermann has left us a puzzle, insoluble in the absence of a specimen, in Cyclamen indicum, for which he gave an alleged Sinhalese name, Urula, which is merely a translation of the European name of Sowbread. Thunberg visited Japan, Java, Ceylon and the Cape, on one of his voyages, and his plants were similarly confused; a reference to Juel's *Plantae Thunbergianae* shows that the "Sinhalese" names affixed to his specimens are in some cases Javanese and in others South African. It is known that Hartog collected at the Cape. May not his specimens have been similarly mixed up? It would seem much more probable that he would collect the Sweet Pea at the Cape than in Ceylon. *T. Petch, Peradeniya, Ceylon.*

CHRYSANTHEMUM MRS. CHARLES READ.

JULY may seem too early for Chrysanthemums, but there is no doubt as to their popularity in mid-July as pot plants.

Mr. F. Ladds, of Swanley, Bexley Heath, and Covent Garden, has been successful in raising two useful golden-bronze varieties which commence to flower early in July. One of these, and the one most useful for the supply of cut flowers, is Mrs. Jack Pearson, figured in our issue of February 3, 1923, p. 65; the other has been named Mrs. Charles Read (Fig. 53). This has shapely, long-lasting flowers, and the earliest plants were offered for sale in Covent Garden market during the second week in July. Of dwarf and sturdy habit, it gives little trouble to the cultivator, as it is grown out-of-doors from April onwards. The cuttings are inserted soon after Christmas, four in a 60-sized pot, and each potful is transferred to a 48-sized pot. As soon as they are established they are placed out-of-doors.

The plants sold readily and regularly in Covent Garden Market, and the specimen illustrated above was photographed on July 14, when it carried seven expanded and one unopened flower. Unfortunately, the variety does not produce sucker cuttings freely, therefore a rather large proportion of plants has to be reserved for stock purposes.

FIG. 53.—CHRYSANTHEMUM MRS. CHARLES READ.

NOTES FROM A WELSH GARDEN.

THOUGH the gale which swept across the country in the early part of the month left in its wake irreparable injury, the heavy rain that fell about the same time did much towards repairing the damage. Such plants as hybrid Clematises, however, were blackened beyond recovery for this season, and ornamental Vines in exposed places have been wilted as by fire.

The Heaths, as might be expected, came through the ordeal the most cheerfully. Indeed, these have seldom been so good, the colours in several forms of Erica cinerea being exceptionally brilliant, and in some of these varieties the spikes of blossom are over six inches in length. E. c. rosea still holds its own among the earlier summer bloomers where a bold effect is desired, and E. c. var. alba can be very effective, the pure white bells being in bold contrast to the exceptionally dark green foliage. The splendid Calluna vulgaris var. Serlei, its stately stems rising to some three feet, is now asserting its claim to a foremost place among the white Heathers, but there is a great charm about the dwarfer variety, gracilis. The new E. vagans, var. St. Keverne, destined to become the most popular of its kind, was early in flower. It is a particularly robust grower, with leafage of a fuller green than that of most kindred varieties, and the very large flower spikes in a fresh, wild-Rose pink are very beautiful and distinct. E. Watsonii, said to be a natural hybrid between E. ciliaris and E. tetralix, is a variety that deserves to be more widely grown, for in flower and foliage it displays the best and most taking features of both its parents.

Romneya Coulteri is always liable to injury by wind, but our oldest and largest plant in a sheltered border escaped the worst of the gale, and, where somewhat thinned, its 7 ft. growths and abundant flowers are now rather finer than usual. No less may be said of Lavatera Olbia, always such a valuable August blossomer, but the wind robbed Dendromecon rigidum of its crop of buds, which promised a good autumn display, and severely injured the somewhat top-heavy Buddleias of the variabilis type.

One of the most beautiful objects in the late summer garden is Apera arundinacea, the Pheasant-tailed grass. Some old clumps of this, about 2 ft. high and 3 ft. to 4 ft. across, are the very refinement of elegance, and the narrow, arching blades, their pale glossy green stained with streaks of coppery-red and tawny brown, are not less attractive than the lovely, sweeping plumes of glistening bronzy purple which adorn the plants with such singular grace. This fine species, though not quite hardy, will withstand fairly severe winters in a dry, stony soil, and self-sown seedlings are usually abundant.

A young specimen of Metrosideros floribunda growing in a sunny spot in open woodland has been bearing its fiery crimson bottle-brushes for some weeks, and another southerner, the Chilean evergreen twining shrub, Berberidopsis corallina, is in bloom on a north wall. Similar conditions to those which the latter enjoys are shared by Tropaeolum speciosum, which has taken possession of a thicket of Azalea pontica, which it has festooned with its scarlet wreaths; and Desfontainia spinosa, which has been in flower since early July, and looks like continuing for several weeks yet.

The Willow Gentians (G. asclepiadea) are always a charming feature of the woodland at this season, and they comprise a number of forms which range in height from 1 ft. to 4 ft. There is also what appears to be a perfectly upright variety of the same species with very dark blue flowers. The latter vary in those plants of the normal sweeping habit, from a luminous azure to a good full blue. Nor can one omit to mention the chaste and lovely white variety which seldom looks so well as it does among Ferns and other herbage of the half-shaded wood bottoms.

Potentilla fruticosa Farreri may generally be relied upon to produce a good late crop of blossom, and this month it is doing exceptionally well, as also is P. f. Vilmoriniana. The fine clear blue of Ceratostigma Larpentae and C. Willmottae associates well with the yellow and creamy white of the above, and in the poor soil in which these Ceratostigmas will flourish the old Linaria repens (purpurea) will make a goodly show of colour. Though this tall and stately Toadflax may be a rather too redundant seeder in some gardens, it is not so here, and some of its forms, notably those with bluish-lavender flowers and the yellow-lipped white, are very effective grouped in their proper place; their flowering season extends from midsummer to late autumn.

Mimulus Bartonianus, whose 3 ft. stems produced such a generous yield of the big, rose-coloured, orange-throated flowers throughout the middle weeks of summer, is putting up a fresh crop of flowering shoots, and, under similar conditions—the soil being cool but freely drained—the uncommon Lobelia Cavanellesii is as well furnished with its curious red and yellow flowers as it was in June. This plant has proved quite as hardy here as L. cardinalis, and, as it runs a good deal, propagation by offsets is a simple matter.

The changeable weather, with its extremes of temperature, of this erratic summer has not daunted the cheerful vigour of the dwarfer Kniphofias, which are once more proving their inestimable value as rock-garden and border plants, many of which can be depended upon to produce successional crops of their brilliantly coloured spikes from June to late autumn. Though it is difficult to differentiate between these charming subjects, I think K. Nelsoni, K. rufa, K. corallina, K. Macowanii, K. brevifolia and K. Goldelse must be considered among the choicest of the better-known dwarf sorts. *A. T. J.*

NOTES FROM WISLEY.

IT is difficult to explain why some admirable and easily cultivated plants fail to achieve popularity. Many deserving species have been lost to cultivation, and others have remained in comparative obscurity, while others more fortunate have very slowly fought their way to recognition. An instance of delayed popular recognition is to be found in Physostegia virginiana, a herbaceous plant related to the Skullcaps. Numbers of these plants, bearing spikes of pretty pink flowers, are to be seen in the shelter beds and herbaceous borders at Wisley.

The gardens have benefited considerably from the recent rain, which has given many plants a new lease of life, and those recently planted a good start. Thousands of seedlings of woodland Primulas, such as P. japonica, P. pulverulenta, P. Bulleyana and P. Beesiana, have just been planted out in the wild garden, and should next year make a gorgeous display.

Offsets have been removed from those plants of Lilium giganteum which flowered this year, and no fewer than three hundred have been planted. These, however, will not flower for at least three years. The glowing flowers of Lilium superbum are now to be seen in parts of the wild garden, where they show up to advantage against the dark background of Rhododendrons. This handsome Lily may be compared to a large and elegant form of L. pardalinum, and has chocolate-coloured stems.

The coming of autumn is marked by the colouring of fruit on the Mountain Ash and on Cotoneaster frigida, which has a large crop of red berries shortly to turn black, and has so far escaped attention from the birds. A plantation of Rubus odoratus, with its now bronzed foliage, also suggests the changing of the season.

On the rock garden a new species of Buddleia which is in flower is bound to be a most useful acquisition. This is Buddleia nanhoensis. Its great merit lies in its comparative dwarfness, for though it has not been grown here very long it seems improbable that it will exceed five feet in height. The flowers resemble those of B. variabilis, and have the same attraction for butterflies and moths.

Among the rock plants Acaena microphylla—to compensate for its modest inflorescence—is sending out showy red spines, and the pink flower-heads of Pterocephalus Parnassii are being transformed into grey, feathery cushions.

(Enothera speciosa, a perennial Evening Primrose having pure white flowers with a lemon yellow centre, is in flower, and the pink-flowered hybrid, Œ. Arendsii, is just over. Not far away is Putoria calabrica, a prostrate sub-shrub which has been very lavish with its pink, tubular blossoms. Superficially the plant is not unlike Daphne Cneorum, but lacks the delicious scent of the latter.

In the bog the rich yellow flowers of Senecio japonica are conspicuous. Here also Sagittaria japonica, a member of the Water Plantain tribe, is flowering.

Most of the Dahlias recommended for trial at Wisley by the joint committee of the Royal Horticultural Society and the National Dahlia Society are commencing to bloom, while those which obtained awards last year have been retained, and are also to be seen. *J. E. G. White.*

TREES AND SHRUBS.

TECOMA RADICANS.

OF the few Trumpet flowers suitable for outdoor cultivation, T. radicans (Bignonia radicans) is generally the hardiest and most satisfactory. This is a deciduous climber of rapid growth that will ascend a wall to 30 feet or more high, clinging to the masonry like Ivy, by means of fibrous roots. The leaves are pinnate, large and handsome, rich green and slightly downy on the under-sides. During August and throughout autumn the flowers are produced in bold clusters at the end of the current year's growths. Individually, these blossoms are trumpet-shaped and of a dark orange-scarlet shade, tending to vermilion.

T. radicans is a native of the south-eastern United States and one of the first garden subjects to be introduced to British gardens from America. Against a warm wall there are few localities in which it will not prosper, and, once established, it will need little attention beyond that of pruning back the laterals to one or two eyes in spring. Though a handsome subject when in full flower, T. radicans is not such a pleasing colour as that of the more tender T. grandiflora and some of its choicer varieties. *N. Wales.*

INDOOR PLANTS.

NERIUM OLEANDER.

THIS handsome flowering shrub, with its glossy, evergreen leaves, is frequently grown in a warm greenhouse, where it becomes a prey to mealy-bug, scale, thrips, etc. Grown outside during the summer and autumn, with the protection of a light, airy house in the winter only, it is much less liable to become infested with these pests, and is a most useful plant for late summer decoration in the formal or terrace garden. Well-grown plants in tubs make beautiful subjects for this purpose when in flower, and are not unattractive even when not in bloom.

To produce good specimens, copious watering and liberal feeding are necessary during the period of active growth, the plants being kept slightly drier after flowering, so that the new growths are not incited to flower.

The flowers are produced in terminal, racemose cymes from well-ripened wood, and the new growths develop at the base of the spray of blossom at the same time—hence the only pruning that is needed is the removal entirely of any worn-out branches to allow their places to be taken by occasional new growths that develop at the base.

When the plant finally becomes too leggy, it can be cut hard back in early spring, but it will not then flower during that season. Cuttings of matured shoots root freely if inserted in small pots and placed in a close frame, and a few cuttings should be struck yearly and the plants grown on so that old and worn-out specimens may be discarded. *W. Auton, Pyrford Court Gardens, Woking.*

ORCHID NOTES AND GLEANINGS.

DISAS

(*Continued from page* 129.)

The blue Disas and others of the grassy-leaved class, whose method of growth and flowering is similar to the British Orchis, have been imported in small quantities for many years, and have occasionally bloomed, been much admired, and passed away, the memory of their graceful beauty alone remaining to their growers.

Disa graminifolia (Herschelia coelestis) is the finest type of the class, and it was well shown by Mr. Tautz, September 11, 1888, when a botanical certificate was awarded the plant, and this, and other blue Disas have flowered frequently at Glasnevin, also in collections in this country.

Disa lacera (Bot. Cert.) and its variety multifida (Award of Merit when shown by Messrs. Charlesworth and Co., on February 22, 1910), D. venusta, D. barbata, D. lugens, and others of the class were flowered occasionally, but no one attained continued success in their cultivation. The first good tubers of D. graminifolia I obtained from Mr. Jas. Hall, of Port Elisabeth, who wrote at the time :—(March, 1885) "If you could see them in bloom here by the thousand I am sure you would say that they should not be much trouble in any cold frame, or even out-of-doors in warm situations. Too much nursing is, I fear, the cause of their failure in gardens at home. Disas of this class form a new bulb (tuber) every year. The old bulb also decays every year. In a week or so after the flowers fade the wind and sun dries up the old flower-stems, and all traces of where the plants are to be found are entirely lost until the next flowering season comes round, their scanty foliage being mixed up with the long grass and Heather. This ought to give the key to successful culture, for everyone knows so well where Heather grows at home, and it is in a similar place that our lovely Disas and Satyriums grow here. Disas may be said to be never inactive, for as soon as the flowers and leaves fade the new bulb is ready to start, which it at once proceeds to do slowly and surely until by the following January the leaves spring up from the tubers which have last grown, and in February and March the tall spikes of four to eight clear blue flowers (on D. graminifolia) appear. December, January and February are the warmest and dry months, and during that time the plants are most active."

The above particulars, written on the upland plain with the Disas blooming around, show that these pretty terrestrial Orchids have the same habit of growth and flowering as our own British Orchids, and it helps us to understand why the Disas are not good subjects to grow and flower after removal and transport. British Orchids, when utilised as garden plants, behave in much the same way. They will grow luxuriantly where they like, but they will not often grow where the gardener likes. The same applies to most of the pretty European Ophrydeae. The explanation seems to be that even in their native habitats both the exotic and the British species depend on renewal by seeds, and, failing that, the plants over any area may die out, but the copiously-shed seeds are ready to replenish the loss of the parent plants.

In a series of articles on spontaneous hybrids of hardy plants, that clever and observant lover of plants, Mr. C. Wolley Dod, of Edge Hall, wrote of the Madeira Orchis foliosa and the British Orchis maculata in his semi-wild garden (see *Gard. Chron.*, March 25, 1899, p 179): "Orchis foliosa makes hybrids with O. maculata. I have for many years grown O. foliosa as a hardy plant. Some years ago I noticed spotted leaves amongst them, but now that I have picked out many of these hybrids, I find plain leaves are as common in them as spotted. The flower-spike is longer, the flowers smaller, and the general character and habit partakes of both parents. They make excellent border plants. O. maculata comes up spontaneously in such spots of the garden as it fancies, the seed being plentifully present in the soil. A favourite spot for it to come is the centre of a mass of rhizomes of German Iris. I may mention that as a sign of the prevalence of Orchis maculata in the native soil that, near the garden is a field which had been for many years ploughed land, but became full of this flower two years after it was laid down for pasture. In that case the roots may have been dormant in the soil, but I am sure that those in my garden came from seed."

Viewed by the light of the communications from Mr. Hall and Mr. Woolley Dod's article, it is easy to account for the failure to bloom, except in a few cases of imported tuberous Disas in the first year, and their unfitness to bloom. The fact is that their behaviour in gardens is only the same as it would be in their native home if they were lifted and kept dry for months and then planted near the spot where they formerly grew. The disturbance and drying prevents the formation of the new tuber necessary for the next flowering, and decline follows.

These Disas are as adaptable for growing outdoors in a selected sheltered position as the Madeira Orchis foliosa, and yet in several gardens Orchis foliosa is quite at home, and Mr. Wolley Dod indicates the method of perpetuating its succession by seed as a safeguard against failure of the tubers. The nearest imitation of his methods with the grassy-leaved Disas I made some years ago was with two or three tubers which I planted in summer in my garden beneath a bush. They came through the winter in good condition with nice white new tubers, but were too small to flower. They were lost sight of and doubtless perished, but they established the fact that they could withstand an ordinary winter. But with these and other species I am sure that the best results would be attained by seeding them and sowing the seed as soon as it is ripe.

The Gladiolus-like, pink Disa pulchra flowered several times with me, and two plants were shown from Tring Park, November, 1905. One received a Botanical Certificate and the other an Award of Merit.

The yellow and orange D. chrysostachya and D. porrecta which seemed at first to be reliable are probably not now to be found, the only little species of this class which is safe in gardens being D. sagittalis. If the grassy-leaved Disas were located when in flower and collected at the end of the year, or January of the following year before growth and flowering begins, the tubers of the freshly imported specimens would, if quickly sent, flower, and a full year be available for the ensuing new tuber, which would have a good opportunity of attaining flowering strength. Collected in flower the chance of the plant blooming the year in which the tubers are received is destroyed, except for a stray tuber or so which may not have sent up spikes before they were dug up. *James O'Brien.*

(*To be continued.*)

LAELIO-CATTLEYA OXFORDENSIS.

Pantia Ralli, Esq., Ashtead Park, Surrey (Orchid grower, Mr. Farnes), sends a noble flower of this showy cross between Laelio-Cattleya callistoglossa (L. purpurata × Warscewiczii) and Cattleya Tityus (Enid × Octave Doin), the small plant having been obtained on the dispersal of the Ogilvie collection at Oxford.

The ancestry of L.-C. oxfordensis includes Laelia purpurata, C. Mossiae, C. Mendelii, C. Dowiana and C. Warscewiczii twice. The flower, which is over seven inches across the broad and wavy-edged petals, is blush white with a tinge of mauve. The lip shows much influence of C. Dowiana; it is deep ruby-purple with thin gold lines from the base to the centre. The fleshy column is pure white. It is fragrant and a good addition to the favourite C. Tityus crosses.

PUBLIC PARKS AND GARDENS.

For a great number of years Bedford has been in every sense of the term a Garden City. The illustration (Fig. 54) shows part of the flower garden, which is situated on the left bank of the River Ouse—about 24 feet from the water's edge. These gardens are maintained by the municipal authority, and all the plants are raised under the care of Mr. H. Quarmby, in Bedford Park—where there are between 200 and 300 ft. of glass. This particular part was designed by Mr. Quarmby—the town gardener, in 1922, to put a finishing touch to the War Memorial, which stands a few yards from the front of the view shown. Nearly 200,000 plants are used annually. The chief of these are Pelargoniums, Paul Crampel, Little Trot, Madame Crousse, and Harry Hieover. Dracaena indivisa is used in the centre of the beds. Other subjects are Fuchsias Tower of London and Fascination, Mesembryanthemum, Willow-leaved Beet, Abutilon Thompsoni, White Marguerites, and Verbena venosa, whilst the borders are almost entirely planted with Lobelia Mrs. Clibran, and Alyssum minimum.

FIG. 54.—THE EMBANKMENT GARDENS, BEDFORD.

Mr. Quarmby devotes a great deal of attention to these gardens, which form one of the most attractive show places of the town. They are the joy and pride of Bedfordians, and others, and are visited by thousands, who admire the beautiful colour scheme, and listen to the strains of the band which discourses music from a floating stand a few yards away.

Gardeners and garden lovers who are visiting the metropolis in the immediate future and have the opportunity should pay a visit to Battersea Park, which has completely recovered its beautiful pre-war condition under the able management of Mr. Frank Wright. The flower beds in the sub-tropical gardens are especially good, notably those furnished completely with Coleuses. The scenery in the sub-tropical garden and the part known as the peninsula, especially near the lake, is very imposing, and another beautiful part is the Old English Garden near the main entrance.

VIOLAS.

To enable them to bloom profusely over a lengthened period Violas require a good and moist soil, not necessarily wet, but one which will support the plants during dry weather. Even in light, well-drained soil, if rich in humus by liberal dressings of manure and leaf soil, Violas will withstand the effects of drought with better results than those produced in a heavier land. Violas are not marsh plants; they grow naturally on knolls, or slopes, or in ground free from stagnant water; therefore, although moist soil may be desirable, it must be well drained.

Sites for garden Violas should be worked to a depth of 15 in. to 18 in. in autumn, when some partially-decayed vegetable refuse should be placed not further from the surface than 1 ft. If the ground will not admit of being turned up deeper than one foot, loosen the hard base, place the manure upon it, and throw up the top roughly for the winter. In spring dress the surface with leaf-soil, wood ash, or old manure, these materials being suited to the requirements of the plants.

Plants raised from seeds grow more uprightly but do not branch nearly so well, and are not, for a time at least, so floriferous as those raised from cuttings. Those, however, who wish to raise seedlings may sow the seed from the end of August to the second week in September in light, rich soil in a sheltered situation. They should be pricked out 3 in. apart in a sheltered spot in October, and planted where they are to flower in March or early April; they will then become well established early.

Cuttings produce the best and most floriferous plants. Take the cuttings towards the end of September or during the first week in October. Choose for them a sheltered border—under a low wall or fence—and moderately rich soil, made fine and level and surfaced with a thin layer of sand. The cuttings should be made from growths which spring from the base of the plants—not exhausted flowering growth—and about 2½ in. to 3 in. long. Dibble them in about half their length 2 in. apart, make the soil firm about them, and follow with a good watering. In cold and exposed gardens the cuttings may be put in a frame and wintered in every respect like shrubby Calceolarias.

Planting should be done in spring before dry weather sets in, and in no case delayed until the usual bedding time, for Violas and Calceolarias are not able to contend with drought if it comes upon them before the roots have obtained a good hold of the soil. Short duration of bloom and sudden collapse are due to late planting.

Plants raised from cuttings made early in October will give an effective summer display, but not infrequently Viola beds become ineffective in autumn, as, indeed, all plants do that have been in perfection during the hot summer months. For late or autumn bloom, cuttings may be struck in May or June in a shady place. For spring or early summer flowering—for it is not until May that Violas are in their full beauty—the cuttings should be inserted during the second week in August and planting done in October. An earlier display may be had by wintering the plants in frames and planting them out during March. Plants divided in October and then planted will afford a good early display.

Violas will withstand wet weather very well, better perhaps than any other bedding plants, and succeed in summer in high, cold situations, where more tender subjects present a starved appearance. Being moisture-loving plants, they are benefited by a top dressing of old manure or coconut fibre refuse in summer, and these materials should be removed as the soil gets moist in autumn.

To keep Violas in full bloom throughout the summer it is necessary to remove the seed pods regularly and to thin out the old stems occasionally so as to encourage young growth; given these attentions and an occasional watering with weak liquid manure, Violas will continue in bearing from early spring to late summer. *James A. Paice, Mill Hill.*

VEGETABLE GARDEN.

WINTER LETTUCES.

As the time for sowing winter Lettuces is near at hand the publication of the awards recently made at Wisley is very opportune.

The trials were most satisfactory as a whole; the winter was comparatively mild, and practically all the trials came to maturity, and as two long rows were planted of each variety the trial was sufficiently extensive to satisfy the most exacting.

The trueness of the strains submitted for test was highly satisfactory, and reflected the greatest credit on the firms by whom they were supplied. It was an agreeable surprise to find that the most successful varieties in the list of awards were the old standard sorts. Of those to which the F.C.C. was given the large form of the old Stansted Park variety was an easy first; in size, appearance and quality it could not be excelled. The adaptability of this Lettuce for universal culture is shown by the fact that it is the variety on which the growers in Southern France rely, and with which our markets are flooded in the early spring. White Madeira, another old favourite; Brittany Winter White, a popular French variety, and Veitch's Winter Giant, rightly received a similar award. All the foregoing are Cabbage varieties, and are only adapted for winter use.

Of the two Cabbage varieties to which an A.M. was awarded, the Hardy Green Hammersmith was quite a surprise, as this variety has been under a cloud for some years past. The colour (a very dark green) is not acceptable to everybody, but the samples tested were of excellent shape and substance and had passed through the rigours of the winter unscathed. The other variety was the well-known All-the-Year-Round, which, despite its rather pale colour is bound to keep to the front. Its reliability and constancy of character are evidenced by the fact that no fewer than six seed firms gained an award for their strains. Of these two varieties the Hammersmith is only adapted for winter use. All-the-Year-Round is good for any and every season.

The upright Cos varieties did not make very brave show; the conditions which prevailed when they were hearting up were not favourable to the production of that tempting but rather delicate appearance which the salad lover so much desires, and even the popular Lobjoit's failed to satisfy the Committee.

The three varieties to which an award was given do not call for much comment, except that for those who appreciate a small, solid, very hardy Lettuce either of the three—Density, Gem and Goldring's Bath (syn. Sugarloaf and Improved Compact Bath)—will fill the bill.

Of the six varieties that were highly commended Schofield's Hardy Winter was far and away the best: for colour, form, size and reliability it cannot be beaten. Early French Frame is valuable for intensive culture. Grand Admiral is a "fail me never" and Hercules (syn. Webb's Wonderful) qualified in perfect style as a winter variety. It is one of the best large, crisp Lettuces in commerce, succeeds well in any and every country, and is probably grown more largely than any other variety in the world. Trocadero (syn. Big Boston) was the greatest disappointment in the field, being relegated to the lowest place in the list. Samples were received from several different firms, but whether the conditions at Wisley were unsuitable, or from some other cause, it failed to satisfy the Committee although, judging by the extent to which it is grown in England, France and America, it must certainly be a very meritorious variety. *S. B. D.*

RUNNER BEANS.

THE dry summer has been very unsuited to Scarlet Runner Beans. In view of the importance of this crop, it would pay, where it has not been done, to soak the roots liberally. A method of training I saw practised a few years ago was to stop each plant and to train two shoots to tall, stout stakes, 15 ft. high, taking out the laterals as they developed, exactly as is done in the case of Tomatos. The pods were mostly 15 or 17 inches long. *T.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante, pp. 71-76.)
(*Continued from page* 134.)

MIDLAND COUNTIES.

OXFORDSHIRE.—The fruit crops are the worst I ever remember. With the exception of Pears, all trees and bushes had an abundance of blossom, but severe frosts in late April and throughout May completely destroyed the prospects for good crops. There was a fair number of Gooseberries, Currants and Raspberries, but the last were very small owing to drought. Strawberries suffered in the same way as last season, viz., severe drought when the berries were swelling. We only registered ¼ inch of rain during six weeks of early summer. Our soil is a light, thin loam on limestone brash. *Ben Campbell, The Gardens, Cornbury Park, Charlbury.*

——Apples are a fine crop, and very good and clean. Pears are the poorest crop for years. The Strawberry crop was very bountiful and good. Gooseberries, Raspberries and Currants were also satisfactory. Peaches and Nectarines are very scarce. During the 33 years I have been here I have had only one year without Apples; they do exceptionally well on this soil. The cold winds in April ruined the Plum crop and nearly did the same for the trees. We had blight in abundance. Our soil is a light loam on gravel and chalk. *J. A. Hall, The Gardens, Shiplake Court, Henley-on-Thames.*

——All fruit crops, with the exception of small fruits are much under the average, and the trees do not look so healthy as usual owing to continued cold in spring, followed by summer drought. American blight is very troublesome this year, also fly on Black Currants. Pears are the lightest crop I have ever known, which I consider is the result of the drought of 1921, when all buds made were fruit buds, and last year it was just the reverse, for Pear trees were almost without flower this spring. Strawberries have been a good crop, but the berries suffered through the fierce sunheat, and were rather on the small side. Both Peaches and Apricots suffered considerably from the cold spring, and leaf curl was very bad, a complaint that has not before been any trouble here in my time. Our soil is a heavy loam overlying stiff clay. *Victor Gammon, Eynsham Hall Gardens, Witney.*

STAFFORDSHIRE.—The present season is the worst for fruit that I have known for the past eight years. Insect pests are responsible for the bad Apple crop. Caterpillars have been numerous, but the trees are making very good growth now, which our strong retentive soil favours. Pears are very scarce, no doubt owing to last year's very heavy crop. Plums promised well, but the fruits dropped after setting. Plum trees were badly infected with aphis. Strawberries were late in ripening. *J. W. Miskin, Woodseat Gardens, Rocester.*

WARWICKSHIRE.—The fruit crops in general are a failure, after a splendid promise, especially Apples and Plums; but the cold spring, accompanied by aphis infestation, completed the disaster. During my forty-five years' experience I have never known this pest to be more troublesome than it has been this year, and in some cases it will take three years to get the trees back to normal conditions. The soil is sandy loam, with a sandstone subsoil. *N. W. Priaulx, Allesley Hall Gardens, Allesley, nr. Coventry.*

——No season within my recollection has been quite so disappointing with regard to Apples, Pears, Plums, and Cherries. These trees at flowering time were more than usually promising, but the weather subsequently was so bad that there is small wonder at our present poor prospects. Late frosts were frequent and severe, and for a period of ten weeks, until July 20, less than one inch of rain fell in our

Digitized by Google

district, which seemed to be a local drought pocket. Mildew has been prevalent on Apple trees. Silver Leaf has appeared for the first time here on Prunus serotina flore-pleno. *Ben H. Martin, Moreton Paddox Gardens, Warwick.*

—This season's fruit crops are amongst the worst on record, principally owing to late frost on May 23, which was very destructive to Strawberry bloom and did considerable damage to Plums and Pears This frost, followed by very cold, high winds throughout June, and a very low rainfall—less than 0.40 inch in six weeks—caused large quantities of young fruit to drop. Blight is very prevalent, especially on Plums and Currants. Peaches and Nectarines are blistered very badly. The crops of Plums and Pears are almost failures. Apples, with few exceptions, are much under the average, and at present it is difficult to decide what the quality will be. Gooseberries were the most satisfactory crop. *H. F. Smale. Warwick Castle Gardens.*

ENGLAND, S.

BERKSHIRE.—In the early part of the season there was a splendid promise for a good fruit year, as all fruit trees had an abundance of blossom, which was, however, spoilt by drought, cold north-east winds, and frost. Apples and bush fruits alone are carrying average crops. *A. B. Wadds, Englefield Gardens, Reading.*

—The winter of 1923 was mild, and fruit buds began to open earlier than usual. On April 9 and 10, 7° and 5° of frost were registered: this was followed on the 11th, 12th and 15th by torrential rains and cold winds. A period of cold, sunless weather followed, and early in May another sharp frost of 10° was registered. The fruit crops are most disappointing, and in the case of Pears almost a failure. Strawberries, although slightly touched with frost, turned out well. Apples are cropping irregularly, certain varieties having withstood the climatic conditions better than others. *J. Minty, Oakley Court Gardens, Windsor.*

—With the exception of Pears, all fruit trees flowered well and set fruits, but late frost and a continued spell of very cold winds favoured the spread of insect pests, and although repeated sprayings were resorted to, the crops of all kinds of stone fruits were ruined, even Morello Cherries. Most varieties of Apples are a good average crop, but many of the trees are affected with blight. Strawberries have been a good crop; bush fruits also, with the exception of Black Currants, were satisfactory. Walnuts are a fair crop, but we have no Filberts. *J. Howard, Benham Park Gardens, Newbury.*

DORSETSHIRE.—The best cropped varieties of Apples are Irish Peach, James Grieve, Bramley's Seedling, Striped Beefing, Keswick Codling, Kingston Bountiful, and Wealthy. A lot of other sorts are a failure. Of Pears we have scarcely any, and Plums are almost as scarce. Gooseberries were a heavy crop, though the berries were on the small side. Currants of all sorts were good, and Strawberries have been very good. The extreme heat and drought spoiled the Raspberry crop. Our soil is chalky and light in texture. *Thos. Denny, The Down House Gardens, Blandford.*

—The Apple crop is on the whole fairly good, though the blossom on a number of trees did not expand, owing, I believe, to injury from heavy hailstorms. Pears are a failure. Plums are patchy; the trees are beginning to suffer from drought, and are dirty. Raspberries also were much affected owing to the absence of rain. Only 0.20 in. of rain fell in the past forty-five days, and that small amount is soon gone on our chalky soil. *W. E. Axford, St. Giles Gardens, Salisbury.*

HAMPSHIRE.—During May and June we experienced very little sunshine, and there were persistent very cold nights, with very keen, cold N. and N.E. winds. These conditions were particularly trying to Raspberries, Damson and Plum blossoms. Apples promise well. Strawberries were good and plentiful. Black Currants also were fine, and Red Currants very good. We had a wonderful crop of Gooseberries. *George Ellwood, Swanmore Park Gardens, Bishops Waltham.*

KENT.—The remarkable show of blossom on Apple, Plum and Cherry trees in and around this district encouraged the grower, but weather conditions frustrated these hopes; Plums and Apples suffered severely here and there, yet in the immediate neighbourhood the majority of these trees are heavily laden. Cherries were plentiful, but the foliage of most fruit trees in the open was dreadfully blighted, what with aphis and caterpillars, and things do not look very promising for another year. Soft fruits have been plentiful, but the sunless weather during June hampered their ripening, specially in the case of Strawberries; Raspberries, Red and Black Currants were on the small side. The soil varies considerably within a mile, from heavy to light and gravelly. *James Mayne, 32, Wigtown Road, Eltham, S.E.*

—Apples early in the season were an average crop in places, but the yield is now under, and if the dry weather continues there will be scarcely any. We have been very short of rain in this district. Pears are almost a complete failure. The cold weather of June affected the foliage of Peaches and Nectarines very much and checked the growth, so that the fruit cannot be expected to attain full size. Raspberries made a good show to begin with, but the dry weather shrivelled them up. *J. D. Colledge, Cobham Hall Gardens, Cobham*

—With the exception of Pears, which developed scarcely any bloom, there was great promise for excellent crops early in the season. Some Apple trees, chiefly old ones, have set an average crop, but young trees are very shy in bearing. Plums came into flower with a few warm days, but later experienced cold north-east winds, with the thermometer down to freezing point on several nights. Black Currants, Red Currants, Strawberries and Raspberries remained in flower over a longer period than usual owing to sunless days and cold nights, but they set remarkably good crops. Peaches, Nectarines and Apricots, although artificially pollinated, failed to set average crops. Caterpillars and Aphis have been very troublesome. The soil is a stiff, clayey mixture over a clay sub-soil. *H. E. Kemp, Holmewood Gardens, Tunbridge Wells.*

—The fruit crop generally reflects very markedly the absence of sun in 1922. Peaches, Nectarines and Apricots did not ripen their wood, and Pears produced practically no blossom. The Apple crop would probably have been large, but in many cases was ruined by an attack of caterpillar, followed by aphis infestation. Strawberries were probably the outstanding crop of the season. Nuts in most parts of the county are an entire failure, but it will be remembered that this follows two very heavy crops. *Edward A. Bunyard, The Bungalow, Allington.*

—Taking Apples as perhaps the most important fruit we grow, I am pleased to say that the prospect of a bumper crop seems well assured in this district. Some of the trees are tremendously cropped, so much so that there must be a big fall. Red aphis is very troublesome—consequently many of those remaining on the trees, with also an attack of scab, will be what we call "scrumps." Since writing the above I notice the leaves of Apple trees are dropping owing to black spots—under some of the trees the ground is literally covered with small fruits. Pears are a total failure, as also were Raspberries. Strawberries were not only a splendid crop, but of a large size and of splendid flavour. Other small fruits are good average crops, but owing to aphis will be somewhat dirty. *George Woodward, Barham Court, Maidstone.*

—Pears are almost a complete failure—resulting from an over-crop last year. The single exception is Pear Doyenné du Comice, which has a good crop on all the trees (pyramids). Our soil is on the heavy side and deep. *Charles E. Shea, The Elms, Foots Cray.*

(To be continued.)

HOME CORRESPONDENCE.

Is Poa annua a Perennial?—Prior to coming North, my answer to the above question would have been in the negative. After much observation of Poa annua in Lancashire, however, I am prepared to assert that here, at least, it is decidedly perennial in habit. I was induced to make careful observation of this plant (which is so often regarded as a pernicious weed) owing to seeing the greenkeepers pricking (transplanting) this grass into some crown-type bowling greens of which I have charge. Knowing the antipathy with which this plant is regarded by lawn specialists, and also its behaviour in other districts, I gave instructions that it was not to be used for this purpose, but, owing to lack of discrimination on the part of the green-keepers, it is still used with other species. Judging by the results that accrue, it is merely a case of "giving a dog a bad name," for not only is it prevalent in some of the best greens in this town, but close observation has proved to me that it constitutes a considerable proportion of the turf in many good greens which I have seen in neighbouring towns. Naturally, the best judges of what a good bowling green should be are the bowlers themselves. As I have often heard expert bowlers commend greens as being good ones, which I am aware are full of Poa annua, then I claim that it is not unworthy of cultivation, and that under the adverse atmospheric conditions of some towns it is quite desirable. Doubtless there are many who hold different opinions, and an expression of these would be welcome. *F. Baker, Parks Department, Wigan.*

Pollination of Cherries.—Will your correspondent *Enthusiast* kindly inform me where the variety of Cherry named Knight's Black, which he refers to on p. 120, can be obtained, and whether it is Knight's Early Black, Knight's Late Black, or a variety distinct from either of these? It is in regard to *Enthusiast's* statement that Early Rivers and Knight's Black pollinate one another successfully that I am particularly interested, for I have recently reported (*Journal of Pomology*, Vol. III., No. 2) that Early Rivers fails to form fruits when pollinated with Knight's Early Black. Since then I have repeated the cross and again failed to obtain a single fruit from this and from the reciprocal cross. From the account of the variety in *Trans. Hort. Soc.*, Vol. III., p. 211 (1820), Vol IV., p. 510 (1822), communicated by Thomas Andrew Knight, and from the description and figure in Lindley's *Pomologia Britannica*, Vol. II., p. 93 (1841), I believe the Knight's Early Black used by me to be correctly named. I have, however, recently obtained another individual under the name of Knight's Early Black which successfully pollinates Bedford Prolific; and since Early Rivers and Bedford Prolific are in the same incompatible group, it may presumably also prove an efficient polliniser for Early Rivers. This individual, however, is not true Knight's Early Black. Having short stalks, a salient character of Bohemian Black, it probably is that variety. In Cherries, varietal differences are frequently slight, and that considerable confusion exists regarding their nomenclature is widely recognised. To meet with two or more individuals under one varietal name is not uncommon, and for this reason I would like to obtain and introduce the Knight's Black referred to by *Enthusiast* into the experiments being carried out here. *M. B. Crane, John Innes Horticultural Institution.*

"Red Plant" in Strawberries.—Mr. Johns, in his letter published in your issue of the 1st inst., fails to prove that he at any time announced or showed evidence to prove that Aphelenchus fragariae was responsible for the production of "Red Plant" and "Cauliflower," and that, in fact, they were the same disease. This is the only aspect of the case which interests us, and further correspondence is unnecessary. *E. Ballard and G. F. Peren, Long Ashton, Bristol.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 4.—Notwithstanding the inclement weather and the absence of so many people on holiday there was a capital exhibition at Westminster on the above date. The hall was well filled with exhibits, but not crowded, and the chief attractions were Dahlias, Montbretias, flowering shrubs, Carnations, Orchids, Violas, Gladioli, and late border and alpine flowers. The Floral Committee made no award for new plants, but made up for deficiencies in this respect by granting no fewer than thirty-two medals, which number suggests increased freedom and generosity rather than the curtailment of medal awards foreshadowed some time ago.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Messrs. Jas. O'Brien (hon. secretary), Gurney Wilson (assistant secretary), Pantia Ralli, Frederick J. Hanbury, H. T. Pitt, Chas. H. Curtis, T. Armstrong, E. R. Ashton and Stuart H. Low.

AWARDS OF MERIT.

Laelio-Cattleya Mrs. Medo, Low's var. (*C. Venus* × *L.-C. luminosa*), from Messrs. STUART LOW AND CO., Jarvisbrook, Sussex. A beautiful hybrid and differing from the original form for which Messrs. Low received an Award of Merit at the last show at Holland Park. That form had the shape of C. Dowiana; in the present variety, which is the more beautiful, the lip is shaped like that of C. Iris in C. Venus. The showy flower has clear chrome-yellow sepals and petals, and claret-purple lip, with yellow markings at the sides of the middle section.

Brasso-Laelio-Cattleya Tucuman, Claygate Lodge var. (*C. Rhoda* × *B.-L.-C. Cooksonii*) from J. J. BOLTON, Esq., Claygate Lodge, Claygate (gr. Mr. S. Lyne). The spike bore two flowers of Cattleya shape, the C. Dowiana in B.-L.-C. Cooksonii setting the form and size, and the Laelia cinnabarina, in B.-L. Mrs. Gratrix, influencing the colour. The sepals and petals are gold colour with a slight bronze shade; the front of the broad crimped lip is reddish-purple, lighter at the margin and with gold lines from the base to the centre.

CULTURAL COMMENDATION.

To Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells, for a very fine plant of Cattleya Iris magnifica with a spike of nine large flowers with bronzy-yellow sepals and petals, and showy claret-purple lip. The plant has been at Orchidhurst for fifteen years and frequently used for hybridising.

GROUPS.

A vote of thanks was passed to J. J. BOLTON, Esq., for a small but select exhibit, which included three very fine forms of Cattleya Hardyana alba with clear white sepals and petals and purple lip, also a splendid plant of the large-flowered Dendrobium formosum giganteum with twelve flowers.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, were awarded a Silver Banksian Medal for a showy and interesting group in which the special features were the large and handsome Brasso-Laelio-Cattleya Truffautiana var. Elene (L.-C. luminosa × B.C. Mrs. J. Leemann), a companion plant to that for which they secured a First-Class Certificate at the last Chelsea show; the present variety has large lemon-yellow flowers tinged with mauve and a broad, rose-purple coloured lip; Sophro-Cattleya Sylvia Low's variety (S.-C. Doris × C. Hardyana), a Cattleya-like flower of clear chrome-yellow and a violet-purple lip; Sophro-Laelio Orpetiana, two very dissimilar forms of their Sophro-Laelio-Cattleya Argonaut, both pretty, the one of mauve and purple colour, and the other light claret-purple with a darker lip. Among species were Cattleya Loddigesii alba, Oncidium incurvum album, Angraecum articulatum with a long raceme of flowers; several Odontoglossum grande and various Cypripediums.

Messrs. ARMSTRONG AND BROWN, Orchidhurst, staged a selection of hybrids which included a fine form of their Laelio-Cattleya Golden Wren (C. iridescens × L.-C. Thyone), with good chrome-yellow flowers that have bright purple lips; the rare, white-lipped Coelogyne speciosa alba, which had previously secured an Award of Merit, the pretty little Trias disciflora with comparatively large flowers and purple spotted labellums; and the interesting Bulbophyllum barbigerum.

Floral Committee.

Present: Messrs. H. B. May (chairman), D. B. Crane, G. W. Leak, Gerald Loder, Chas. E. Pearson, G. Harrow, M. C. Allwood, W. Howe, C. R. Fielder, J. F. McLeod, H. J. Jones, W. B. Gingell, T. Hay, J. B. Riding, Thos. Stevenson, Amos Perry, Clarence Elliott, W. B. Cranfield, Reginald Cory, Sydney Morris, A. Turner, and W. G. Baker.

New plants and novelties were conspicuous by their absence, a few Gladioli and Chrysanthemums—a total of six subjects—were placed before the Floral Committee, but no award was made.

An interesting plant shown by Mr. G. G. WHITELEGG was Anagallis Monellii var. Willmoreana, of semi-trailing drooping habit and bearing numbers of rich blue flowers.

GROUPS.

No doubt in view of the National Dahlia Society's show on the morrow, Dahlias were an important feature of the floral exhibits. Messrs. CARTER PAGE AND CO. had a very large collection of excellent blooms (Silver-Gilt Flora Medal). Messrs. J. CHEAL AND SONS also showed typical blooms of the different sections (Silver Banksian Medal), and the CENTRAL GARDEN SUPPLIES CO. (Bronze Banksian Medal) also staged good blooms, but we reserve our comments on these collections for our report of the Dahlia show.

Messrs. SUTTON AND SONS again set up a large and imposing collection of the best commercial varieties of Montbretia. The large ornamental jars, containing liberal quantities of fine spikes, made a very charming display. The principal varieties were Queen Mary, large bright orange flowers with crimson markings; Una, delicate pale orange, with crimson reverse; Queen Charlotte, deep orange with paler zone; Henry VIII., a very large orange-coloured flower freely stained with red; and Lemon Queen (Silver-Gilt Banksian Medal).

On a table space Mr. S. MORRIS set up an interesting collection of new or recent varieties of Montbretias, and all of considerable merit. Copper King is a desirable flower of uncommon colouring, which may be described as dull crimson heavily shaded with copper; Jessie is a charming combination of crimson and golden yellow; Rosemary is a very round flower of orange-yellow shades; Joan of Arc is a very good yellow, and Queen of Spain is the best pale orange-yellow variety (Silver Flora Medal).

Besides the above collections, which were composed solely of Montbretias, this flower was associated with other hardy border flowers by various exhibitors.

Mr. AMOS PERRY showed such valuable plants as Pentstemon barbatus Torreyi, Physostegia virginiana, several showy species of Kniphofia, Lilium splendens of rich colouring, and a collection of herbaceous Phlox (Silver Banksian Medal).

Messrs. B. LADHAMS, LTD., also displayed a small collection of their useful varieties of perennial Lobelias, Phygelius capensis, flowering sprays of Rubus fruticosa, and heavily fruited branches of Blackberry Shirley Prolific (Silver Banksian Medal).

On a floor space Mr. H. J. JONES made an attractive display with a large collection of herbaceous Phlox and well-grown plants of Cocos Weddeliana. Chief varieties amongst the Phloxes were Marie S. Jacob, Mrs. M. van Hoboken, soft rosy mauve; Thor, of slightly deeper colour and with a pronounced carmine eye; Wm. Ramsey, royal purple; and Riverton Jewell, mauve with carmine eye (Silver-Gilt Flora Medal). Mr. M. PRICHARD contributed an interesting collection of border flowers, including Gladioli, Michaelmas Daisies, Gaillardias, Aconitum Fisheri and Campanula bononiense album, a comparatively slender, erect-growing species bearing white flowers (Silver Flora Medal).

Besides the rare Anagallis Monellii, var. Willmoreana, of beautiful blue colour, Mr. G. G. WHITELEGG showed some good Delphiniums, Tree Lupins, Erigeron hybridus roseum and other border flowers (Silver Flora Medal). Mr. T. CARLILE filled a long table space with such border flowers as Delphiniums, herbaceous Phlox, Kniphofias and Pentstemons (Silver Banksian Medal). Mr. W. WELLS, Junr., included several pots of the dwarf Nertera depressa bearing orange-coloured berries, and also showed Lupins and Scabious (Silver Banksian Medal).

The CHALK HILL NURSERY CO. staged some excellent pot plants of their Giant Mimulus, vases of Pentstemons, Gladiolus, a good strain of Antirrhinums, and many interesting little plants of Sempervivum species (Silver Banksian Medal). Mr. F. G. WOOD included beautiful flowers of Rudbeckia purpurea of a good form, Lobelia magnifica and several varieties of herbaceous Phlox (Bronze Flora Medal).

In the annexe Mr. F. GIFFORD arranged a valuable collection of Delphiniums in such varieties as Queen of the Belgians, Lord Curzon and Lavanda (Bronze Flora Medal). Mr. G. REUTHE displayed a collection of Liliums, Phitesia buxifolia, Campanula turbinata and its varieties in his exhibit of uncommon plants (Bronze Flora Medal). Messrs. RICH AND CO. showed Phloxes and hardy Crinums (Bronze Flora Medal). The CENTRAL GARDEN SUPPLIES CO. included Gladiolus and Roses in an exhibit (Bronze Banksian Medal). Mr. G. W. MILLER staged a collection of hardy flowers (Bronze Flora Medal).

Though of rather small size the Roses in the various collections were especially brightly coloured. Messrs. WHEATCROFT BROS., who are fresh exhibitors at these fortnightly meetings, set up a collection of Roses which bore intense colouring. Their principal sorts were Emma Wright, The Queen Alexandra Rose and Christine (Silver Banksian Medal). The Rev. J. H. PEMBERTON staged handsome stands of Mary Monro, Golden Emblem, K. of K., Ruth and Mermaid (Silver Flora Medal). Near the gallery Messrs. ALEX. DICKSON AND SONS showed excellent blooms of such Roses as Emma Wright, Betty Uprichard, Lady Inchiquin and K. of K. (Silver Banksian Medal). Messrs. D. PRIOR AND SONS included Alice Amos, Souv. de Georges Pernet and Madame Jules Gravereaux in their exhibit of Roses (Silver Banksian Medal).

Tall stands of Los Angeles, Ophelia, Golden Emblem, Mrs. Hy. Bowles and the fragrant Walter C. Clarke were well shown by Messrs. PAUL AND SON (Silver Flora Medal).

A large collection of Gladiolus was displayed by Messrs. KELWAY AND SON. Their outstanding varieties were Sword of Fire, Dorothy Kelway, Prince of Orange, Alderman, Duchess of Argyll and James Kelway Toms (Silver Flora Medal). Messrs. R. H. BATH LTD., staged Prince of Wales, Wilbrick, White Giant, Chris and Alice Tiplady in a good collection of Gladioli (Silver Flora Medal). MAJOR CHURCHER had well arranged vases of Alice Tiplady and Dorothy Wheeler (Bronze Flora Medal). Mr. A. EDWARDS showed Theela, J. A. Koen, Atlanta and Topsy in his collection of Gladioli (Silver Banksian Medal).

Many splendid pot plants of Streptocarpus hybrids were displayed amongst Adiantum Ferns by Messrs. R. and G. CUTHBERT. Many of them were under colour names. Besides these, Princess Mary, deep pink, and Baroness Inverforth, soft rose, were excellent (Silver Flora Medal). Carnations of great merit were shown by Mr. C. ENGELMANN (Bronze Flora Medal). Messrs. ALLWOOD BROS. (Bronze Flora Medal), who also had many vases of their useful Dianthus Allwoodii, and Messrs. STUART LOW AND CO. (Silver Banksian Medal). Mr. YANDALL had splendid Violas in boxes. Moseley Perfection, yellow, Edina, dark blue, W. H. Woodgate, pale blue, and J. V. Macdonald, white, are the names of only a few of the good sorts on view (Silver Banksian Medal).

Fruit and Vegetable Committee.

Present: Messrs. J. CHEAL (in the chair), W. G. Lobjoit, Geo. F. Tinley, A. C. Smith, H. Prince, T. Pateman, W. Bates, W. H. Divers, E. A. Bunyard and A. N. Rawes.

Mr. W. G. LOBJOIT presented a dish of Apples Worcester Pearmain gathered from trees that had been top grafted on the variety Lady Sudeley, which in turn had been grafted on the Paradise stock, probably Rivers' Broad-leaved Paradise. Mr. Lobjoit considered that there was evidence in the fruits of the influence of Lady Sudeley, in the colouring, the shape, and also sometimes in the flesh, which occasionally is yellow. Mr. Bunyard considered that it was possible the re-grafting might have an influence on the early maturing of the fruits just as "ringing" might affect the ripening, and this also may be responsible for the streaky nature of the red tinge.

Mr. W. CAIRNS, Southill Park Gardens, Biggleswade, Bedford, showed a seedling Melon raised from Royal Jubilee crossed with Superlative. It is a handsome fruit of oval shape and yellow flesh, but the rind is thick and the specimen submitted was not considered to be perfectly finished, but would probably have been better in a fortnight's time. No award was made.

A new Blackberry and a late Raspberry were both recommended for trial at Wisley, where collections of these fruits are grown, and we understand the Raspberry is already growing in the Wisley collection.

Messrs. DANIEL BROS., Norwich, again exhibited their Black Currant September Black, and on this occasion showed a few dishes of Apples of such varieties as Lord Suffield, Stirling Castle, Herring's Pippin, Rev. W. Wilks, Warner's King, Bismarck, Charles Ross and Red Victoria.

CARDIFF GARDENERS.

THE annual outing of the members of the above Society took place on Monday, the 20th ult., when a visit was made to the King's Acre Nurseries, Hereford. The party was met at the station by Mr. Lovelock, the nurseries' representative, who pointed out many of the older objects of interest in the city. After lunch the party proceeded to the nurseries, where all were impressed by the welcome and also the high standard of cultivation.

The firm entertained the party to tea, and on arriving at Cardiff at 10.30 all agreed that not only had it been a day of enjoyment, but most instructive.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

AUGUST 23.—*Committee present:* A. Hanmer, Esq. (in the chair), Messrs. R. Ashworth, J. Birchenall, A. Burns, A. Coningsby, D. A. Cowan, J. Cypher, A. G. Ellwood, J. Evans, J. Howes, A. Keeling, D. Losh Thorpe, D. McLeod, E. W. Thompson, J. Whitham, and H. Arthur (secretary).

FIRST-CLASS CERTIFICATES.

Cypripedium Daisy Barclay, Gratrix var., a very distinct variety of large size with very bright markings. From S. GRATRIX, Esq.

Cattleya triumphans var. Evansiae (*Rex* × *aurea*), a fine flower with sepals and petals of rich ochre-yellow, the lip being crimson with orange lines; *Laelio-Cattleya Dodona* (*L.-C. Haroldina* × *L.-C. Nelthorpe Beauclerc*), a shapely flower, the sepals and petals crimson-purple with lip of a richer shade and orange lines. From Mr. J. EVANS.

Brasso-Laelio-Cattleya Muriel var. Perfection, an enormous flower with sepals and petals of a deep rosy-mauve colour, the lip having a deep yellow throat. From Messrs. COWAN AND CO. A Silver Medal was also awarded for this plant.

AWARDS OF MERIT.

Laelio-Cattleya Zeno var. splendida; *L.-C. Latona var. Golden Dawn*; *Cattleya Abekeniae*; *Odontoglossum Felicity* (*Olympia* × *ardentissimum*), and *O. crispum var. Sunspot*. From S. GRATRIX, Esq.

Cattleya Diana var. Brilliant (*Sibyl* × *aurea*), from Messrs. COWAN AND CO.

GROUPS.

S. GRATRIX, Esq., West Point (gr. Mr. J. Howes), was awarded a Silver Medal for a group. Mrs. BRUCE and Miss WRIGLEY, Bury, (gr. Mr. A. Burns), staged a group to which a Silver Medal was awarded. Messrs. J. CYPHER AND SONS, Cheltenham, were also awarded a Silver Medal for a group.

READING AND DISTRICT GARDENERS.

BETWEEN forty and fifty members paid a visit to Sheffield Manor gardens by the kind permission of Mr. and Mrs. Liddell on the occasion of the last evening meeting of the summer session of this association. The party was met by Mr. V. O. Smith, the gardener, and commenced an inspection of the glasshouses. The first house contained a bright display of annuals in pots, including Statices, Phlox Drummondii, Lobelias, Verbenas, etc. In the next house visited was a collection of stove plants such as Caladiums, Dracaenas, etc. Carnations were a feature. In the centre of the range tuberous-rooted Begonias, Hydrangeas. Fuchsias and Campanulas were flowering profusely. Tomatos under glass were fruiting splendidly, whilst Fig trees were carrying a good, sound crop. Much interest was manifested in the vineries, magnificent bunches being noted. There were also fine batches of Gloire de Lorraine Begonias, Calanthes, Poinsettias and Chrysanthemums being prepared for autumn flowering. The outside fruit trees were in excellent condition, and the vegetable crops good, notwithstanding the unfavourable season. The herbaceous borders were a blaze of colour. The pleasure grounds were next visited, where the beautiful specimens of Cedars, Oaks and Rhododendrons excited admiration. The visitors were hospitably entertained by Mr. and Mrs. Liddell.

BANFF HORTICULTURAL.

THE Banffshire Horticultural Association continues right well, fulfilling its educative work throughout the area embraced by it, as was apparent by the wonderfully good display the members put up at their annual show in the county town, Banff, on August 15. The entries were good, and the attendance of the public was exceedingly large. Some well-grown specimens were forthcoming in the pot plants section, the leading honours going to Duff House (gr. Mr. J. A. Grigor), Eden House (gr. Mr. James McLennan), and Minmore House (gr. Mr. G. Troup). The dominating feature in the cut flowers section was the fine display of Sweet Peas. The Silver Cup offered for Sweet Peas was won by blooms from Dunlugas House gardens, the runner-up being Mr. Grigor. Apart from the cup-winning entry, mostly all the chief prizes for Sweet Peas were won by the last-named exhibitor. Other leading honours in the cut flower sections went to Minmore House, Eden House, Park House, and Beldorney. The fruit display was a small one, especially the Apple classes. The chief prizes were won by the owners of Fife House, Dunlugas, Fife Arms and Park House. The vegetable classes were well filled, and made up a wonderfully good show. In the class for a collection of vegetables, amid strong competition, leading place was taken by Duff House, while Minmore House, A. Craib, Banff; R. Cook, Banff; A. Chalmers, Tillynaught; and J. Munro, divided the other chief honours.

Exhibits by amateurs made a very satisfactory display, the leading prizes being won by Mr. JOHN MANN, Banff; Mr. A. SOUTER, Gordon Arms Hotel, Keith (winner of Silver Rose Bowl for Sweet Peas); Mrs. GORDON, St. Leonard's, Banff (for fruit); and Mr. JAMES INGLIS, Banff (for vegetables). Mr. JOHN MANN won the Silver Rose Bowl offered to the most successful competitor in the amateur classes. Some indication of the large attendance of the public may be gathered from the fact that Banff Post Office was sold out of entertainment stamps, there being, of course, side-shows, necessitating payment of the Entertainment Tax.

ANSWERS TO CORRESPONDENTS.

CAKE DUST: *Denmark.* Cake dust may have some manurial value, but its use would tend to increase the adhesiveness of heavy soil rather than lighten that medium. You do not state which kind of cake dust you refer to.

CARNATIONS: *Grower.* We do not understand your question. Do you refer to the maintenance of plants for an indefinite period, or the retention of flowers in a fresh condition for so long a period as possible?

COSTS OF GARDEN WORK: *G. H. H. W.* Information as to the average cost of garden work will be found in such publications as Newsham's *Horticultural Note Book*, Seabrook's *Modern Fruit Growing*, and Weather's *Commercial Gardening*, but we do not know of any book which deals solely with the subject. As no doubt you are well aware, the costs will vary considerably according to locality and the nature of the soil, so that any given figures can be only approximate and are liable to considerable variation. But, under average conditions, we believe the cost of bastard trenching would be roughly about 4s. 6d. per rod, and marking, cutting, and rolling turves 36 inches by 12 inches by 1½ inch about 3s. per 100.

FAILURE OF DOYENNE DU COMICE AND PITMASTON DUCHESS PEARS: *J. R. C.* The Pear buds are quite normal. The deformed condition of some of the leaves in early spring was probably due to the unkindly season, which also robbed you and most other gardeners of a crop. In the previous years the trees had hardly been established long enough to bear.

NAMES OF FRUIT: *S. B.* Specimens small, and in some cases malformed and not fully developed. They appear to be: 1, Margil; 2 and 5, Bramley's Seedling; 3, Bismarck; 4, Gladstone; 6, Sheep's Nose.

NAMES OF PLANTS: *M. M. O.* 1, Aralia Guilfoylei; 2, Phyllanthus nivosus; 3, Ophiopogon Jaburan; 4, Strobilanthes dyerianus; 5, Peperomia argyrea; 6, Calathea, sp. not recognised; 7, Pelargonium crispum; 8, Dracaena Godseffiana; 9, Phoenix reclinata; 10, Kentia belmoreana. *H. E. P.* Lactuca Bourgaei. *S. P. S.* 1, Mesembryanthemum blandum; 2, M. Brownii; 3, probably M. Ecklonis; Cassinia fulvida (Diplopappus chrysophyllus); 5, Atriplex Halimus; 6, Gazania splendens. *H. M.* 1, Viburnum rhytidophyllum; 2, Hypericum kalmianum; 3, Crataegus orientalis; 4, Clematis Viticella var.; 5, Prumnopitys elegans; 6, Clerodendron trichotomum; 7, send in flower; 8, Rhus Cotinus; 9, Neillia opulifolia. *Firs.* 1, Cupressus pisifera var. plumosa; 2, Thuya occidentalis; 3, T. dolabrata; 4, Cupressus Lawsoniana; 5, C. nootkatensis; 6, Pseudotsuga Douglasii; 7, Cupressus macrocarpa; 8, Pinus Banksiana.

NECTARINE LORD NAPIER: *S. J.* The apex of the fruits of this variety is very liable to turn brown, especially in very hot weather. Do not syringe the tree very early in bright weather or late in the day in dull weather. Afford temporary shade to the tree after the stoning period of the fruits is over and until they are ripe. Leave the front and top ventilation open a little at night. Red spider and thrips, especially the latter, often cause the fruits to turn brown unless checked in time. If you give the roots plenty of water and avoid the causes mentioned, you should have no further trouble with rusty fruits.

PEACHES WITH SPLIT STONES: *C. S.* The two Peaches had split stones, though this would not prevent the fruits from swelling when stoning was completed. In your case we do not think stoning was completed. The two chief causes of failure were the temperature of 70° to 80° from March onwards (55° to 70° is much safer and better), and gross growth. The tree should not produce such strong wood as you suggest it does. Instead of having to prune this gross wood, partially lift and root prune the tree in the autumn,

Digitized by Google

cut back any very strong and gross roots growing downwards, laying the more fibrous roots nearer the surface, and use at least one-third of old lime rubble in the compost. Thoroughly water, shade and syringe the tree afterwards to prevent flagging.

SPRUCE SHOOTS UNHEALTHY. *A. Z.*—The specimen of Spruce sent for examination shows no indication of the tree having been attacked by the Pine weevil, but it was very badly infested with Spruce Aphis (Chermes abietis). This insect punctures the bases of the young leaves about the period of their early development. Eggs are deposited in the leaves, which immediately begin to swell, forming small cone-like galls on the young shoots. These galls are often called Pine-apple galls and are not only disfiguring but detrimental to the health of the trees. Small trees may be cleared of the pest by collecting and burning injured shoots, and larger isolated specimens may be improved in health by spraying with paraffin wash at intervals of 8 or 10 days during the early summer. The best time for spraying, however, is during May and early June. At that period it is possible to destroy many of the mother insects that have hibernated throughout the winter and are then becoming active.

STERILISATION OF SOIL TO KILL WEEDS: *E. G. L. W.* The wording of your question is not quite clear. Anything of a poisonous nature that would kill weed seeds in the soil would more readily kill living plants on the lawn. On the other hand, if you hoe the cultivated ground once a week during May and June there will be no weeds to kill except those of the first crop, which will die and wither on the soil, if the hoeing is done on a dry day. The next crop of weeds cannot appear till autumn, when rain is frequent; and in that case you might have to hoe and rake the weeds off the soil. If you put them in a heap they will ferment or heat and cause the seeds to germinate. Then turn the heap and bury all the weeds that germinate on the top. The seeds that germinate inside the heap as the result of heating will be killed. Some gardeners apply newly slaked lime to hasten the process, but it wastes the fertilising properties of the weeds to some extent. This method of destroying weed seeds is better than applying poisons.

TOMATO FRUITS DISEASED: *A. S. R. and Co.* The black patches on the Tomato fruits are evidences of the presence of Cladosporium scabies. All diseased fruits should be removed and the plants sprayed at intervals with sulphide of potassium. The colouring of the fruits was poor, and suggests that there is need for an addition of potash to the soil.

TREES SHRIVELLED: *H. N.* Without inspecting the trees, it is quite impossible to decide what caused them to shrivel and die. Lightning does, of course, damage trees on occasion, but usually some evidence of its effects is shown by the splitting of the trunk. You do not say whether there is any obvious damage other than the shrivelling, and possibly you must look to some other cause than lightning for the effects set out in your letter.

VINE AND FIG LEAVES DISCOLOURED: *J. K.* An examination of the discoloured leaves proved that neither fungus nor bacterium was present, therefore we can only conclude that the injury is something in the nature of scorching.

VINE LEAVES: *H. W.* There was no fungous disease present on the Vine leaves you sent: the trouble is probably due to scorching, which is brought about by the action of strong sunlight upon the tender foliage while it was wet with condensed moisture. Ventilate the house more freely, and especially early in the morning to drv up moisture before the sun's rays are powerful.

MARKETS.

COVENT GARDEN, Tuesday, September 4, 1923.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

CUT FLOWERS.

REMARKS.—There has been a general shortening of supplies of cut blooms during the past few days, which is quite exceptional for the latter part of August and the early days of September. All grades are advancing in price, this being most noticeable amongst Carnations, the general supplies of these flowers at the present time being poor in quality, although they are soon cleared. Roses are also less plentiful, but these are arriving in a better condition, the weather being cooler and suited to their development. Lilium longiflorum is holding firm in price, and is excellent in quality just now. The quantities of Chrysanthemums are gradually increasing, but supplies are not sufficient for present requirements; disbudded blooms now include Sanctity, Duchess white; Mercedes and Hollycot (yellow). Some good bronze and pink Chrysanthemum blooms are now on sale. Spray varieties consist of Horace Martin, Verona and Betty Spark. A few bunches of Roi des Blancs were on sale this morning; this sort will be a good selling line on account of the poor quality of white Asters and the shortage of other small white blooms. Giant-flowered Gladioli from home growers are much shorter, but supplies continue fairly good from Holland. Sweet Sultan, Montebretias and double Gypsophila have been greatly reduced in numbers during the last few days. Statices are still offered in fair quantities. Physalis is arriving in first-class condition and is moderate in price; there is also a good supply of Dahlia blooms

REMARKS.—Conditions of trade have been steady, and a fair volume of business has been transacted. English Apples sold well until last week-end, when large quantities of windfalls were forced on the market, the clearing of which brought about a restricted demand, and lower prices for best grades. At the time of writing the tendency is better, and higher prices are being realised. English Plums are not plentiful, and their prices are comparatively high, although there are fairly large quantities of this fruit being imported from the Continent. A sprinkling of Pears coming to hand are selling freely. The Tomato trade is firmer, the dull weather checking supplies. Cucumbers are not inquired for and are quoted lower. Forced Mushrooms are easier, outdoor Mushrooms being more plentiful. Choice fruits, such as Grapes, Peaches, Nectarines, Figs and Melons show little variation in values. A few Cobnuts are being marketed. Green vegetables are in moderate demand. Runner Beans are scarce and realising high prices.

GARDENING APPOINTMENTS.

Mr. John Nibbs, for the past four and a half years Gardener and Bailiff to V. L. OLIVER, Esq., Whitmore Lodge, Sunninghill, Ascot, Berkshire, and previously at The Croft, Henley-on-Thames, as Gardener and Bailiff to K. K. CARSON, Esq., Frimhurst, Frimley Green, Surrey. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

Mr. A. F. Brazener, previously Gardener to Mrs. HASLER, at Newnton House, near Tetbury, Gloucestershire, as Gardener to Major H. C. ALLFREY, at the same address.

SCHEDULE RECEIVED.

Metropolitan Borough of Bermondsey.—Exhibition of Fruit, Flowers and Vegetables, to be held in Bermondsey Town Hall, Spa Road, on Thursday, Friday and Saturday, September 13, 14 and 15.—Secretary, Mr. G. Catchpole, Town Hall, Spa Road, Bermondsey, S.E.16.

CATALOGUES RECEIVED.

BARR AND SONS, 11, King Street, Covent Garden, W.C.2.—Bulbs; Flag Irises; Daffodils.

KING'S ACRE NURSERIES, LTD., Hereford.—Roses.

D. PRIOR AND SON, LTD., Colchester.—Roses, trees and shrubs, etc.

DOBBIE AND CO., LTD., Edinburgh.—Bulbs, Roses, Sweet Peas, etc.

Fruit-Drying. As is well known, fruit-drying on a commercial scale is as rare in this country as it is common in the United States of America. There, Prunes, Raisins, Apricots, Apples, Pears, Peaches, Blackberries, Loganberries and Raspberries are the chief fruits which are dried. In California, sun-drying is practised and varieties of Peach and Plum specially suitable for drying are grown; but in the other parts of the United States where fruit-drying is practised, artificial heat is used. The production of dried fruit in California is considerable. According to the information published by the United States Department of Agriculture,* the annual production of dried Prunes in the United States amounts to 400,000,000 pounds, and of the quantity one-half consists of sun-dried Californian fruit. Sun-dried Raisins produced in California amount to about 200,000 tons per annum. In other States of the Union, fruit-drying, which is practised on a considerable scale, is carried out by artificial heat, the chief fruits used in the industry being Prunes and Apples. It is of special interest to note that fruit evaporation in America is, as opposed to canning, a small industry carried out by fruit growers and used by them as a stabiliser, or safety-valve. By means of this side industry, surplus fruit in years of high yield is taken off the market and the price of fresh fruit is in some measure maintained. Needless to say, anything which helps to give the grower a fair price when Nature has been kind to him in giving him a good harvest deserves the fullest encouragement. That American fruit growers are fully alive to the importance of utilising this subsidiary means of making fruit-growing profitable is shown by the fact that dried fruit is produced on a quarter of a million farms in the United States. It would be interesting to know the reasons why fruit-drying has not been adopted widely in this country. Some of the reasons are patent. The humid climate evidently increases the cost of drying. The varieties of fruit grown in this country do not appear to be well suited for drying. This applies particularly to Prunes. The "Prune" of America is any variety of Plum which, when dried with its stone, does not go bad. Most Plums, when dried without the removal of the stone, ferment and are therefore useless. Certain varieties of Prunus domestica alone possess the Prune property of keeping after drying in their skins and with their stones. In America the varieties of Prune which dry best are the Italian and the Agen, better known as the French or Petite. Many trials have been made with Prune-drying in this country, but we are not aware that they have been successful. Whether this is due to the use of unsuitable varieties, the adverse climatic conditions experienced in these Islands, or to the failure to apply suitable methods to the drying of Plums, we do not know. It would be interesting to learn the experience on this subject which has been accumulated at the Camden Fruit Preserving Factory. In the United States, it is found necessary as a preliminary to the successful drying of Prunes to render the skins of the fruit more permeable to water than they are in their natural state. This is done by plunging the fruit for a few seconds into a boiling solution of caustic soda or caustic potash. The strength of the solution is varied according to the variety of Prune: for those with the most resistant skins one pound of soda to ten pounds of water, and for varieties with less resistant skins, one pound to twenty-five or thirty gallons. Another method which has been, apparently, in large measure replaced by the soda method, consists in passing the fruit before drying over needle points in order to puncture it with many fine holes. This method, however, is open to the objection that the needle points are apt to break off and stick in the Prunes. After dipping to soften the skins, the Prunes are washed and dried until the fruit is springy and pliable. In the course of drying, the fruit loses about sixty-six per cent. of water, so that three pounds of fresh Prunes give about one pound of dried fruit. Before packing, the Prunes are softened by dipping either in a solution of common salt, one pound to twenty gallons of water, in glycerine, one pound in twenty gallons of water, or in a solution containing one pound of glycerine, one pound of salt to thirty gallons of water. By this means the fruit becomes bright and glossy. In applying it, care has to be taken to leave the fruit in the solution only long enough for it to become pliable, and it is found that it is best to use a hot solution and to dip only for a short time. There can be but little doubt that if a suitable means could be devised of drying the Plums, e.g., Pershore, which are grown commercially in this country, a considerable gain might accrue to Plum growers in years of large Plum harvests; but the proposition is a difficult one because Pershore Plums do not appear to lend themselves readily to drying, and because the Plum harvest is so capricious that in some seasons the drying plant would be idle owing to scarcity of fruit unless it could be switched on to the drying of Apples or other vegetable produce.

* "Evaporation of Fruits." By Joseph S. Caldwell. U.S. Department of Agriculture *Bulletin* No. 114. Washington, D.C., May, 1923.

National Rose Society.—At the recent meeting of the Council of the National Rose Society the exhibition dates for 1924 were fixed provisionally as follow:—Spring Show, April 11; Summer Show at Regent's Park, June 27; Autumn Show, September 11 and 12. The question of a provincial show in the midland or northern counties was left for further consideration. The Society's dinner in celebration of the increase of membership to over ten thousand this year will be held at the Hotel Metropole on Thursday, September 20, on the same day as the Autumn Show.

Sad Death of a Flower Show Adjudicator.—The body of Mr. J. Charlton, of Felling-on-Tyne, was found in a pond near Jarrow on the 10th inst. Mr. Charlton had officiated as a judge at a flower show on the previous Saturday, and apparently fell in the pond in the darkness after leaving the exhibition.

Sir George Watt.—Sir George Watt, C.S.I., so well-known for his work in connection with Indian and other botany, recently celebrated his golden wedding and received many congratulations on the occasion, to which we add our own and those of our readers. Sir George Watt is still keenly interested in his life work, and cultivates a choice collection of alpine and other plants in his beautiful garden at Chinsura, Lockerbie, Dumfries.

"**Botanical Magazine.**"—The *Botanical Magazine*, published on August 13, contains illustrations and descriptions of the following ten plants: Hemerocallis nana, tab. 8968, is one of several dwarf species of Hemerocallis, which Mr. George Forest discovered in the mountains of north-west Yunnan. The flowers are solitary or paired, 6-7 cm. long, and coloured deep orange. The plant is hardy in the milder parts of the country, but the flowers are very fugitive, lasting only a day or two, so that the species is not likely to be of great value for gardens; Picea brachytyla, tab. 8969. Apparently several names have been given to this Conifer, including ajanensis, Alcockiana, complanata, ascendens and Sargentiana, and Abies brachytyla, which was given by Franchet, who first described the plant in 1899. Dr. Stapf states that having examined practically all the dried material quoted by the authors of the names given, he comes to the conclusion that there is no combination of characters that might be used to discriminate between them, and of single characters apparently only one to sort them by, namely, the shape of the cone-scales. There is a fine specimen of this Picea in Mr. G. W. E. Loder's garden at Wakehurst, Ardingly, Sussex. It is said to have very handsome foliage, the bright green of the backs of the needles contrasting very pleasantly with the glaucous white of the reversed faces. Clethra Delavayi, tab. 8970, a new Chinese plant, is a charming subject for the shrubbery, where it gets slight shelter from other subjects. It has broadly lanceolate foliage, the leaves being rich green above, whilst the under surface is very pale or almost grey; the young foliage has a down formed of minute star-shaped hairs. The flowers are developed in one-sided racemes and have white or faintly crimson coloured corollas. The beauty of the plant is enhanced by the segments of the calyx turning deep rose or red after the petals have dropped. Echinocereus Baileyi, tab. 8971, is a handsome flowered Cactus, having a tufted, cylindrical stem, and bearing on the upper part large, funnel-shaped flowers of a beautiful carmine-rose colour. The species is a native of North

Digitized by Google

America. Carmichaelia australis, tab. 8972, is, like other members of the family, leafless or almost leafless, but develops a very large number of small, flattish branches, bearing flowers arranged in short three to six flowered racemes, which spring from the axils of the scale leaves. The blossoms are very pretty, being white striped with violet on the standard. The plant was in cultivation in this country so long since as 1825, and grows at Kew out-of-doors in the shelter of the walls of the Temperate House, where it flowers in June and July. Rhododendron sinogrande, tab. 8973. This plant was illustrated and described in *Gard. Chron.*, June 3, 1922. The illustration was reproduced from a photograph taken by Mr. A. J. Creek, Trengwainton Gardens, Heamoor, Cornwall, where the plant flowered last year, producing five flower buds and ninety-eight fully developed flowers. Gentiana rigescens, tab. 8974. In a description of this plant published in *Gard. Chron.*, January 3, 1914, p. 15, it is stated to be a sturdy grower of a bushy habit with persistent stems and foliage. The flowers are of violet-pink colour. The plant is very floriferous and late blooming; it is a native of West Yunnan. Haemanthus Lynesii, tab. 8975. This very brilliantly flowered bulbous plant was discovered by Admiral Lynes, in the Darfur region on the western side of the Lake Chad-Nile divide. Admiral Lynes gave some of the bulbs to the late Mr. Elwes, who flowered the plant in the latter half of July, 1922. The plant needs to be grown in a stove house under conditions similar to those that suit H. multiflorus. The almost globose umbel of flowers carries over fifty blooms, the attractive part of which are the brilliantly scarlet filaments, each some 2-3 cm. long. Wattakaka sinensis, tab. 8976. This plant is a member of the Asclepiadaceae, and forms a climbing or pendulous shrub up to three metres high. It was flowered by the Hon. Vicary Gibbs in his garden at Aldenham House last summer, and raised from seed collected by Mr. E. H. Wilson, about fifteen years ago. The flowers are very much like those of the Hoya, and are developed in a pendulous umbel. The segments of the corolla are fleshy and white, or faintly creamy, with coral or claret-red dots partly running into blotches and streaks. The plant at Aldenham is growing on a wall facing south, and so far has never suffered injury from frost. Echium coeleste, tab. 8977. This very showy plant has beautiful sky-blue flowers, produced in a long, erect-growing panicle. It is a native of the Canary Islands, where several other species are found, but E. coeleste is said to be probably the most beautiful of them all. The plant would need indoor cultivation in this country, except in such favourable localities as Cornwall.

New Afforestation Area.—The Forestry Commission has acquired about 1,800 acres on the Kerry Hills, in Montgomeryshire, for the purpose of afforestation. The district supplied much timber during the war, the soil and situation being naturally suited for its production, and especially the growing of Conifer timber. It is intended to proceed with the clearing of the ground at the earliest possible moment, in order to find work for unemployed labour. In other directions it is hoped that the scheme will create a demand for labour, such as in the multiplying of small holdings in the district as nurseries of labour for the forests in winter, while the maintenance of the forest will also mean the permanent employment of a considerable body of men. Eventually saw-milling and a box and basket-making industry may be established in the neighbourhood. The acquisitions of the Forestry Commission up to date are approximately 171,000 acres of land in Great Britain, of which 114,000 acres are reported to be land that can be planted. Of this area about half is distributed throughout England and Wales, and the remainder throughout Scotland. The amount of work before the Forestry Commission in dealing with the land already acquired is very considerable, as up to the present not more than 27,000 acres have been planted.

Mr. Robert Anderson. — Widely known throughout the horticultural world as Superintendent of the Phœnix Park, Dublin, Mr. Robert Anderson's retirement from that important and onerous post, after nearly twenty-four years' service, now notified, comes somewhat in the nature of a surprise, as he is in the prime of his activities. He is a born gardener in the fullest sense of the term, and his father, and grandfathers on both sides of the family, were in their day noted Scotch gardeners. His early training took place under his father at Newstead Abbey, Nottinghamshire, where he spent four years, leaving to enter the propagating department of Messrs. Dickson's nursery, Edinburgh, from there passing on to Castle Wemyss gardens under the late Mr. Henderson. After two years at Castle Wemyss and a year at Cally Park, Kirkcudbrightshire, Mr. Anderson was appointed to the post of foreman under the late Mr. Jas. Smith at the Earl of Rosebery's gardens, Mentmore, Buckinghamshire, a position he filled for two years. Then followed a period at Dalkeith Palace gardens, under the late Mr. Malcolm Dunn, and, eventually,

MR. R. ANDERSON.

after being engaged as foreman in Lord Sackville's gardens, Knole Park, Kent, he was there promoted as head gardener. Mr. Anderson next became gardener and estate manager to the Hon. Harris Temple, Waterstown, Athlone, Westmeath, a position which ended fifteen years after with that gentleman's death. In the year 1900 he received the appointment under the Public Board of Works (Ireland) from which he now retires. Both as Superintendent of the noble Phœnix Park generally, and the People's Gardens in particular, Mr. Anderson has had ample scope for his cultured taste and abilities, and the happy experience of carrying out various alterations suggested by him. Notably has this been evident in extensive and tastefully expressed schemes of shrubbery planting outside the gardens in proximity to the city entrance, with both ornamental and forestry planting farther afield. Within the Park's circumference of seven miles, embracing 1,760 acres, with all its amenities to control, including the extensive gardens and grounds attached to the various official residences; with twenty-eight miles of magnificent roads, for which Mr. Anderson has been directly—or as horticultural adviser to the Board, indirectly—responsible; the Inchicore North, and Long Meadows estates, the Royal Hospital, Kilmainham; and grounds connected with other government buildings, his post, as remarked, has indeed been an onerous one. Nevertheless, it is his work in the People's Gardens which has brought him and kept him most in the critical public eye. These gardens in their admirable setting and pleasing natural variety, always interesting, have afforded the opportunity for creating those remarkable floral displays in spring and summer which interested visitors have considered as second to none in Europe. Mr. Anderson's many friends will wish him, with Mrs. Anderson, continued health and all happiness in quiet retirement.

Autumn Rose Show.—The National Rose Society's autumn Rose show will be again held this year in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday and Friday, the 20th and 21st inst.

Allotment Holders to Aid a London Hospital.—Under the auspices of the Borough of Hornsey Allotments Association, a Gift Day will be held by Highgate allotment holders and local residents, in aid of the Royal Northern Hospital, on Saturday, 15th instant at 3 p.m., at "Oakleigh, View Road, Highgate, by kind permission of Mr. Percy Mitchell, J.P. Gifts may be sent to this address or to the Hon. Secretary, Mr. A. H. W. Blackburn, 105, North Road, Highgate. Mr. G. B. Mower White, F.R.C.S., Emeritus Surgeon, will receive gifts on behalf of the hospital.

End of Summer Time.—Readers are reminded that summer time ends to-morrow, Sunday, September 16, at 3 a.m. (summer time), when the clocks should be put back to 2 a.m. Whilst a few people consider that the operation of the Daylight Saving Act is a disadvantage, the majority will be sorry when "summer time" ends, especially those who are fond of out-door sports and hobbies, of which gardening may be reckoned one of the most popular, particularly since the war. Summer has seemed all too short, and now that another period of fine weather has set in, it seems a pity that the extra hour of evening daylight will be taken suddenly from us. The difference now that the days are shortening is very appreciable, and some think that to reduce summer time by a quarter of an hour each week for a month would be preferable, in order that the change from summer to autumn might not seem so pronounced.

The Paeony in America.—The Paeony is one of the favourite flowers of growers in the United States of America, probably because it succeeds so well in that country and has a value, not only from a garden point of view, but also for floral decorations indoors. The American Paeony Society has a membership of six hundred and eighteen, and, judging by an illustration in the *Bulletin of Paeony News*, this year's exhibition in the Hippodrome of the Minnesota State fair grounds was one of the largest held in connection with any special flower. The building in which the exhibition took place has a floor space of 290 feet by 110 feet, and, beside the blooms displayed in the exhibition proper, there was a background of evergreens and booths filled with Paeonies, the *Bulletin* stating that the exhibition proved a sight long to be remembered. The *Bulletin*, which is published by the Society, is somewhat on the lines of our Rose, Sweet Pea, and Carnation Annuals, and deals with all kinds of matter pertaining to the Paeony. In an article by Mr. Bertrand H. Farron "Some noteworthy varieties of Paeonies of the present day," he states that ever since the American Paeony Society was organised an effort has been made to agree on what are the best hundred varieties, without success, but he gives a list of what he considers the first ten, which are Therese, Le Cygne, Kelway's Glorious, Philippe Rivoire, Solange, Walter Faxon, Mons. Martin Cahuzac, Enchanteresse, Karl Rosenfield, and Richard Carvel. It is interesting that most of these varieties are not of American raising, although Mr. Farr states that there are certain varieties of American raising with which they can be matched. As to outstanding varieties, by which he interprets those varieties most discussed and written about, he gives Jubilee, Mrs. Edward Harding, Kelway's Queen, and Miss Salway.

Research Station, Long Ashton, Bristol.—On Wednesday, the 26th inst., the fruit plantations of the Station will be open to visitors from 11 a.m. to 4 p.m. The experimental work in progress will be explained by members of the staff, and in addition some of the most recent types of spraying machines and cultivators will be shown in working order by representatives of leading firms. Demonstrations of tree stump blasting will take place at 12.45 p.m. and 2.30 p.m. At intervals during the day members of the staff of the horticultural division of the Ministry of Agriculture and Fisheries will demonstrate methods of packing and grading Apples, and the new Cutler grader will be on view. An exhibition of some of the newer varieties of Apples is being arranged. The Minister of Agriculture, Lt.-Col. Sir Robert Arthur Sanders, Bart., J.P., M.P., has intimated his intention of visiting the Station on this occasion, and it is hoped that there will be a representative attendance of agriculturists and horticulturists of the West of England to meet him.

Map of Wart Disease Infected Areas.—The Ministry of Agriculture has issued a map showing the principal districts which are scheduled as infected areas under the Wart Disease of Potatos Order of 1923. This map will be of particular value to dealers in Potatos, since the movement of Potatos from the infected areas to other districts is prohibited except as regards Potatos of immune varieties for ware purposes. A list of the areas is appended to the map, copies of which may be obtained from the Offices of the Ministry, at 10, Whitehall Place, London, S.W.1, price 6d., post free.

Appointments for the Ensuing Week.—Monday, September 17: National Chrysanthemum Society's Floral Committee meets. Tuesday, September 18: Royal Horticultural Society's Committees meet; Winchester Horticultural Society's meeting. Wednesday, September 19: Morley and District Paxton Society's meeting. Thursday, September 20: National Rose Society's autumn show at R.H.S. Hall (2 days): Manchester and North of England Orchid Society's meeting. Friday, September 21: Eastbourne Horticultural Society's meeting. Saturday, September 22: Paisley Florists' Society's show; Walkerburn Flower Show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Cockroaches.* About six weeks ago our Orchid house was infested with cockroaches to such a degree, that sometimes, in the course of one night, large plants were denuded of their roots, and to kill these pests the following scheme was had recourse to. Three pennyworth of arsenic was mixed with half a pound of melted tallow, and in this a quantity of small birch twigs were dipped five or six times, till they became coated. These were then stuck among the plants, and made to hang down in the way that Orchid roots do. The cockroaches, taking the tallowed twigs for roots, ate their fill, and death was the consequence. So effectually has this answered, that now there is not a cockroach, nor the effects of one to be seen, and the plants are again making beautiful roots. I took great care not to let any of the poison touch the plants, experience having taught me that, if any poisonous substance is brought in contact with the tender parts of a plant, those plants die. A good sized Potato, with its centre cut out, is a first-rate trap for them, and answers at the same time as a trap for small shell-snails, earwigs, and woodlice. It should be placed with the hollow side downwards, so as to form a sort of hiding place. I convinced one of the young men here of the utility of having a few of these simple traps in an Orchid house, by showing him one evening, two large brown snails and a cockroach making a comfortable meal off an Ash-leaved Kidney, and yesterday morning I showed the same person fourteen woodlice in one Potato. *John A. Watson, Exotic Nursery, King's Road, Chelsea. Gard. Chron., September* 9, 1848.

FLORISTS' FLOWERS.

NEW GLADIOLI.

It is always interesting to grow a few new plants each year, even if the anticipation is greater than the realisation. It is not to be expected that all new varieties of Gladiolus will turn out "top notchers," but this year results have not been so good—at least, in my case—as in some previous years.

The first variety to attract my attention was Ivorine, an Australian-raised flower, sent to me last year too late to report on. In colouring it resembles Incontestable, but the growth is taller and perhaps the flower is slightly larger.

Then came Scarlet Treasure, an American variety of Primulinus type. It is a bold flower, and makes a striking picture massed in a bowl.

FIG. 55.—NEW DAHLIA THOS. EWBANK (SEE P. 163).

Juno was next on the list, with rich orange flowers, but the fault, this year at least, is that it is dwarf. Then came Excelsior, a five-footer, with flowers reminding one of those of Mrs. Frank Pendleton. Another Primulinus hybrid, Yellow Treasure, is an attractive yellow with a well-frilled spike. This has the appearance of a good grower and multiplier.

Of the new Kunderd introductions, up to the present (August 25) I am not so favourably impressed. Of the eight large-flowered varieties I have seen, Lycello, Treasure, and Orange Glow appealed to me most. Of the new Primulinus varieties of the same raiser, Pansy will stand out as the premier flower.

Of the older varieties which have maintained their reputation mention may be made of J. E. Shaylor, Mary Pickford, Byron L. Smith, Mrs. Dr. Norton, Scarlet princeps, Red Fire, Fire Ribbon, and Black Pansy.

Of the smaller growers it would not be fair to overlook Gold, and there is another variety, Scarlet Wonder, which produces the largest flower I know. The individual blooms are as large as, if not larger than, those of White Giant; it produces in most cases two spikes from each corm, is a gross grower in every respect, and should prove a good border plant, not being too tall.

Having mentioned Gold reminds me that Golden Measure is also in bloom, and I can judge the rival merits of the two for the first time. I think the former will gradually oust the latter. It is a much neater-growing plant, and the flowers are of good quality, both as regards size and colour. Golden Dream, unfortunately, is not yet in bloom, so I have been unable to compare this with Gold so far. Last year Golden Dream varied somewhat in depth of colour, a characteristic which it did not appear to possess the previous year.

Have any of your readers grown Orange Glory? This is the most uncertain variety I know, but, owing to its colour, one cannot decide to discard it. The first year I grew it, it produced such beautiful spikes that I increased my stock of it, only to find out the vagaries of the plant, for it did not bloom during the next two years; then last year it consented to send up a few spikes, but so late that they did not fully develop. This year I planted about forty corms, but up to the present I have failed to discover more than one flower spike. *Smilax.*

NEW DAHLIAS.

In the present issue we publish illustrations of two new Dahlias (see Figs. 55, 61), both of which have been recommended for trial in the R.H.S. gardens at Wisley; for descriptions of these Dahlias we refer our readers to the report of the National Dahlia Society's show on page 163. We take the opportunity to remind Dahlia lovers that the novelties recommended for trial last year are in flower in the R.H.S. Gardens at Wisley, where they may be inspected.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

Masdevallia.—The present season is most suitable for overhauling the stronger growing varieties, potting those that require it, making the compost firm, and surfacing others that are in a sound state. The compost should consist of good fibrous peat, A1 fibre, and Sphagnum-moss in equal parts, with sufficient fine broken crocks to render the whole open and porous. Ordinary flowerpots are suitable for such as can be accommodated in reasonable sized pots; but larger specimens are best grown in deep pans, or half pots, as they are sometimes called Whatever receptacles are used, the drainage should be perfect, as the plants require an abundance of water when in full growth. Certain kinds of Masdevallia are stronger rooters than others, and the former may be given slightly more pot room than those of a less robust constitution. Whenever a plant shows signs of decay in the centre, it should be broken up, and the decayed portions removed. The outer parts that are sound and vigorous may be re-made into a specimen, or potted up separately according to requirements.

Re-making Specimen Plants.—In re-forming a specimen, make quite sure there is some new material between each section of the plant, as it is placed together. By placing the pieces together in this way, it is then possible for the plant to develop in every direction. Plants that are in a thoroughly sound state, with good centres, will be benefited by shifting them into larger pots, being careful to disentangle the roots, and remove all sour and decomposed material. It is better in all cases to err on the side of using pots or pans of an undersize rather than place them in large receptacles. No Orchid succeeds if its roots are in a constantly wet condition, and these plants especially suffer during the winter if the compost remains in a wet state for any considerable length of time. If any of the stronger growers have made a very large number of roots, and are not afforded new rooting material, there is a danger of the plants presenting a sickly, unhealthy appearance before another season comes round, and it is always much easier to keep a healthy plant in condition than to bring an unhealthy one back to good health. These remarks apply to all the large, strong-growing Masdevallias, such as M. Harryana, M. Veitchii, and many others, which comprise a family that was at one time appreciated, perhaps more than any other class of Orchids, for their distinct and desirable colours. They grow best in the warmest part of the cool or Odontoglossum house, in a position close to the roof-glass, where they may be shaded from strong sunshine. Although they enjoy plenty of light, they are not capable of withstanding the strong rays or the heat of the sun, as they require a cool, humid atmosphere the whole year round.

HARDY FRUIT GARDEN.

By A. J. HARTLESS, Gardener to Major J. F. HARRISON, King's Walden Bury, Hitchin, Hertfordshire.

Grading of Fruit.—Growers in private establishments are perhaps not so concerned with the grading of fruit as those in the trade; but it may not be thought too early to deal with the matter. The grading of fruit is a very important and necessary work. Even for home consumption, small and scabby fruits should not be mixed with sound ones. The contact of diseased fruits in store is often responsible for considerable losses over extended periods. Fruits of clean and even size should be kept together. These may be stored in their varieties and sections, each section having being labelled on a card, which may be dropped or slid in a metal holder. Damaged fruits should be kept by themselves for immediate use. It is advisable to burn all small fruits that are badly attacked with scab.

Woolly Aphis.—Frequent attention is necessary to keep this pest in check, the increase of which is likely to go unnoticed, where the foliage is thick. Painting with methylated spirit is an effective remedy on the older wood. If the outer woolly covering is forced aside by hosing or hard syringing with water, an insecticide will kill the pests. Otherwise, this covering is practically a sure protection against any spray.

Watering.—Trees, especially on walls, must not be allowed to suffer from want of moisture, or the fruit will not swell properly. At this time of year one is apt to think that the roots are sufficiently moist after one good rain, but where a tree is bearing abundant foliage, it is surprising the amount of water carried to the outer diameter of the tree, leaving the roots nearer the trunk almost dry. The absorption of moisture by a wall in a hot position is also considerable. The unsuspected dryness of soil at the footings of the wall is often the cause of failures of wall fruits.

Stone Fruits.—Plums and other stone fruits are ripening, and those on wall trees should be protected from birds and wasps.

PLANTS UNDER GLASS.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Annuals in Pots.—Seeds of annuals intended for spring flowering should be sown about the middle of the present month. They should be sown in pans or boxes according to the quantity required, standing the seed pans in cold frames, where they should be kept shaded until germination takes place. The seed should be sown thinly, and the seedlings should be pricked off before they become crowded. They are best transplanted into pans or boxes until they are large enough for transference singly into small pots, while some of the slender growing kinds may be grown three or four in a receptacle. To flower annuals successfully in pots they should be grown under perfectly cool and airy conditions at all times. In the immediate neighbourhood of London, through lack of sunshine and the frequency of fogs, it is very difficult to grow annuals succesfully, and at Kew we defer sowing until early in the New Year. The most useful annuals for this purpose are Clarkias, Godetias, Schizanthus, Mignonette, Nemesias and Antirrhinums, the intermediate varieties being best for this purpose. Collensia bicolor is also very pretty, also the tall branching Larkspurs. Scabiosa atropurpurea, of which there are many varieties, is very pretty and useful grown in this way.

Schizostylis coccinea Crimson Flag.—This beautiful plant, although more or less hardy in front of warm walls in the south and west, is very suited for the decoration of the cool greenhouse during autumn and early winter; for this purpose strong clumps may be lifted at this time and placed in six-inch pots. It is a useful subject for providing a supply of cut flowers. In Devonshire the plant is hardy in the open, a large bed providing ample supplies of cut flowers, a framework being erected to support a canvas covering, which is put over at night to protect the flowers from frost.

Bravoa geminiflora.—This pretty bulbous plant is a native of Mexico, and although more or less hardy in the south in sheltered positions at the foot of warm walls, is worthy of more general cultivation in pots in the colder parts of the country. It grows quite well in any good potting compost; and four bulbs may be placed in a 48-sized pot. It only requires the shelter of a cold frame until such time as it comes into flower. The bulbs may usually be purchased during the autumn or winter, and should be potted early in the New Year.

THE KITCHEN GARDEN.

By R. W. THATCHER, Gardener to MARK FIRTH, Esq., Carlton Park, Market Harborough, Leicestershire.

Hoeing.—Constant attention should be given to this work whenever the ground is dry enough, for at no season of the year do weeds grow faster than they do now, and to leave them to grow large means greatly increased labour and trouble later. Systematic hoeing between all growing crops will greatly help them to finish in a better condition. Where crops, such as Onions, Carrots, Beet, and Parsnips, are becoming matured and reaching full size, care should be taken not to damage them when hoeing between the rows. Keep down all weeds between growing plots of Broccoli, Savoys, etc., and draw a little soil up to the stems to help to support them.

Potatos.—Continue to lift Potatos as they become ready, which can be ascertained by the foliage becoming yellow and the tops dropping over. Dig a few roots, and, if the skin is firm on the tubers, they are ready for lifting. There is nothing gained by leaving them in the ground a day longer than is necessary. Lay the tubers on the floor of an open shed for a few days to allow them to dry before storing them, and turn them over on one or two occasions. Remove the tops as soon as all the tubers are harvested; any of the latter showing signs of disease should be taken away and burnt, and the ground roughly raked over and left in a tidy condition. Tubers required for seed purposes should be selected and laid on shallow trays to thoroughly ripen. The very smallest tubers and any damaged ones should be thrown out and used as pig food.

Radishes.—Seed of Radishes may still be sown in small batches if desired—either outside or in a skeleton frame where the plants may be well watered and protected from birds with old fish-net. Since the introduction of so many quickly maturing varieties, it has become less necessary to sow the winter varieties, such as Black Spanish or China Rose, but, if these are desired, they may be sown now in a sheltered position and treated as advised above.

Spinach.—Make a sowing of Spinach on a warm border to withstand the winter. Thin the young plants when they are large enough to handle, and dust them with old soot. Perpetual Spinach is a useful substitute, and the leaves should be kept picked regularly to ensure a fresh supply.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

Ripe Grapes.—Where the greater number of bunches in any of the houses have been used, the remainder should be cut and stored in the Grape-room, or in a fairly dark room where sufficient warmth can be maintained to dispel the damp. The bunches should be cut with a good length of wood attached, and the end placed in bottles containing water; ordinary wine bottles are excellent for this purpose, and care must be taken to prevent the berries rubbing against the bottles. Examine the bunches occasionally, and remove any berries that show the least signs of decay; if this is neglected, the bunch will soon become disfigured and spoilt. When all the bunches of Grapes have been cleared, the vines may be syringed thoroughly to cleanse the foliage. The amount of air admitted may be increased gradually until full ventilation is afforded. The borders should be given a good soaking with water, if it is found necessary to do so.

Figs.—Fig trees in pots should be removed out-of-doors as soon as they are cleared of their fruits, to favour maturation and ripening of the growths which are intended to produce fruits next year. Any that are in small pots and need further root-room may be transferred to larger receptacles forthwith. The plants will soon make new roots if the work is done while the leaves are still hanging. With frequent applications of stimulating manures it is sur-

Digitized by Google

prising how well and how long Fig trees continue to be fruitful in small pots. In potting or top-dressing Fig trees, lime rubble and bone-meal should be included in the compost. After the foliage has ripened and fallen the trees should be cleansed thoroughly of all insect pests preparatory to their removal—should severe weather occur early in the autumn—either to a suitable shed, or the Fig house, which should first be cleansed ready to receive the trees. Permanent trees should be rested as much as possible by affording them plenty of air both by day and night. All unnecessary growths should be removed in order that the air and sun may have free access to the growths. Where the trees are trained near roof-glass, it is advisable to allow the shoots to remain untied, unless the tips touch the glass, in which case they should be partially tied down to prevent injury by frost. By leaving the growths near the roof-glass they receive the full benefits of light and air, which are so necessary in the ripening process. Trees carrying a second crop should not be overcropped, otherwise the effect will be detrimental to the prospects of a good crop in the following season. So long as growth continues and the foliage remains healthy the roots should receive an adequate supply of water. After fruit-bearing ceases the amount of stimulants afforded should be gradually lessened, and feeding discontinued entirely when the leaves commence to change colour and ripen.

THE FLOWER GARDEN.

By C. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Colchicum autumnale.—With a view to having them in flower in autumn, bulbs of this pretty subject should be planted now, and a piece of grass-land is as good as any place in which to arrange a few simple groups. The kind of soil is practically immaterial. C. speciosum is a tall and large-flowered species, and well suited to a front place in the herbaceous border.

Two Late Clematis.—Clematis flammula and C. Viticella rubra bloom from about the third week in August well into September, and are particularly valuable at a time when Rambler Roses are over and most annual climbers past their best. Both those mentioned are small-flowered compared with the big Jackmanii type, now so well known; nevertheless, the flowers are freely produced on established plants, and a pillar or portion of a wall covered with them is an estimable addition to a flower garden at this season. The blooms of C. flammula are fragrant.

Celsia cretica.—This plant has flowered well with us, a few odd flowers still being apparent, in the open spaces of a shrubbery. In its early stages the leafy root-tufts much resemble Foxgloves in appearance, and the cultural requirements of the latter also suit the Celsia. Seedlings are easily obtained, and the best way to secure them—or at least as simple a way as any—is to allow a few plants to ripen their seed and disperse it where the plants have flowered, transplanting the seedlings later elsewhere, if desired. Celsia cretica is sometimes grown as a pot-plant for the cool house, but it is quite hardy and thoroughly suited to outside treatment; pre-eminently so in my experience.

Annuals.—It is a good plan to make an autumn sowing of a few of the strongest and most useful annuals, as, so treated, they flower considerably earlier than spring-sown seedlings. An ideal place to raise and winter the plants is on a warm, well-drained border consisting of light soil. The seed can be sown broadcast, or, as I prefer, in drills, and the seedlings left throughout the winter, transplanting them in spring to where they are to flower. The plants may be sown at this season in their permanent places, but few gardens will have such sites cleared yet. An alternative place for sowing in the case of cold soils is unheated frames filled with suitable soil. The lights should be kept off the frames except in the most inclement weather, for the plants should be grown as hardily as possible.

THE ALPINE GARDEN.

DEINANTHE COERULEA.

THIS somewhat uncommon plant, allied to the Saxifrages, is a subject well worth a place in a moist, but well-drained, corner where it will not get too much sun. Its broad-lobed, deeply divided leaves bear no little resemblance to those of a tuberous-rooted Begonia in their reddish colour and fleshy crispness, and they are fringed with a row of almost spiny hairs. The leaves attain a height of 8 inches or so, and the flowers form a loose cluster of remarkable beauty. The individual blooms are about one inch across, and the five rounded petals of a cool slaty-blue of most appealing loveliness, are centred with a ring of closely-set stamens of the same unusual tint. D. coerulea is not a difficult plant to cultivate in a free vegetable soil, and it is one of those which, once grown, are always grown. *A. T. J.*

FIG. 56.—POTENTILLA ALPESTRIS.

POTENTILLA ALPESTRIS.

THIS Potentilla (see Fig. 56) is one of a group of small-growing plants especially suited for the rock garden. It is very variable in habit, due to its wide distribution over the whole of Europe, and the many different situations in which it is found. P. alpestris is a low, tufted plant with woody stems, and tufts of leaves composed of five leaflets, having deeply serrated margins. The yellow flowers are produced on procumbent stems four inches to six inches long in the early summer. It is an easily grown plant, doing well in almost any situation in the rock garden, but it prefers a sunny place in well-drained, loamy soil. Propagation is effected by means of seeds sown in spring, or division of the old plants, either in autumn or early spring. A form with smaller leaves and flowers is P. a. var. baldensis, and there are others that are more straggling in habit. Suitable companions of the above, and belonging to the same genus, are P. aurea, P. nevadensis, and P. verna, all of dwarf habit and bearing yellow flowers. *W. I.*

ERODIUM CORSICUM.

THE soft, round, hoary foliage and delicately rose-coloured flowers of this plant are most showy, and it is admirably adapted for the rock garden, particularly in dry, sunny situations in a sandy soil. *W. Logan.*

THE BULB GARDEN.

PLANTING HARDY BULBS.

THE bulb season has returned, and with it the usual catalogues with their tempting offers of choice varieties of Narcissi, Tulips, Hyacinths, Crocuses, and many other scarcely less attractive subjects.

The purchasing of bulbs is frequently delayed, to the disappointment of the purchaser. The bulbs that ripen first come earliest to the market, and are usually of better quality than those that ripen later. Further, deterioration in store, although not rapid in the earlier part of the season, is, nevertheless, a factor, and it increases as the season advances. The growth which actually takes place in Crocus, Hyacinth, and Tulip bulbs while they are in the store affords sufficient proof that the store-room is not the place for them to pass the autumn in, however well they may have passed the time there in the later summer months since they were harvested. The best advice that can be given to those who would have a creditable display of bulbous flowers next spring is to buy early and plant early.

Hardy, spring-flowering bulbs are amongst the cheapest of garden plants; they produce a floral display of surpassing splendour if cultivated with reasonable skill, and the planter may indulge in the greatest variety without incurring an extravagant outlay.

Where geometric arrangements of beds are to be planted with bulbs, a few sorts will be preferable to many, but in borders a wider range of varieties may be employed. The choice of varieties is largely a matter of individual taste, but for a small formal garden a combination of yellow and scarlet flowers produces a brilliant effect.

One of the greatest recommendations of early bulbs for furnishing the formal garden is that their growth is completed before the season of summer bedding, and by the end of May the bulbs are so far ripe or ripening that lifting does not seriously harm them.

Apart from bedding schemes carried out with flowering bulbs, every garden offers great scope for the use of these plants in a variety of ways. Planted in quantity and variety in grass and in the more open spaces fringing the shrubbery, they are beautiful and attractive and a source of much pleasure. *W. Auton.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C.2.**

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 5, Tavistock Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

SHAKESPEARE'S PLANTS.

THIS recent addition* to the literature dealing with Elizabethan plant-lore, by Mr. Frederick G. Savage, of Stratford-upon-Avon, follows the same lines as the late Canon Ellacombe's well-known book, *The Plant-lore and Garden-craft of Shakespeare.* Though it deals with each plant in a separate chapter, alphabetical sequence has not been followed; but an excellent index is appended, which includes both the botanical names and the natural orders. The book is based upon 155 articles which appeared in the Stratford-upon-Avon *Herald* from 1909-16; and is illustrated by twelve interesting half-tones of scenes of local interest. It is evident that the author is a keen lover of Nature, and though he has woven into his book much that has but little direct bearing upon his subject, it is nevertheless very pleasant reading. His preface states that his notes have been collected "over the best part of half a century."

Although all direct reference to the authorship-controversy has been rightly excluded, the author is without doubt an ardent "Stratfordian," and cannot wholly disguise his personal convictions. Thus, on p. 77 we read: "Sir Francis Bacon, who, we freely admit, was possessed of a mighty philosophic intellect, ... "; followed on the next page by a somewhat prejudiced condemnation of the *Sylva Sylvarum.* Again, with reference to the lines:

> I know a bank whereon the wild thyme blows,
> Where oxlips and the nodding violet grows;
> Quite over-canopied with luscious woodbine,
> With sweet musk-roses, and with eglantine.

he chooses "the sequestered, gently-sloping bank of the Wilmcote Downs" as the place of inspiration. Might not the same be held of hundreds of other places in England? On p. 377, regarding some lines in *The Two Gentlemen of Verona,* he says, "I cannot help thinking that it pictures the river [Avon] by which he spent many thoughtful schoolboy hours"; though he admits "Shakespeare is the most difficult of all poets to localise"; and, one might add, the easiest to spend imaginative conjectures upon.

The number of plants mentioned by Shakespeare is about 150; yet between 2,000-3,000 were known to the herbalists of his time. His references to plants were necessarily tempered to the then average man's knowledge; and although they are always those of a highly-trained and acute observer, they cannot be taken as an indication of the number of plants known to him. Plants were to him some of the (often) most insignificant details in the great drama of human life that engaged his attention throughout the Plays; and were used as accessories or similes only as the occasion arose. If we find no mention of the Snowdrop, Foxglove, Cornflower, Lily-of-the-Valley, or other plants well known in his days, it is simply because either such plants failed to find a natural place in his story, or would have failed to make an immediate appeal to his audiences. Therefore, those who restrict a garden to the cultivation of the plants mentioned by Shakespeare, in the belief that they are including the plants commonly found in Elizabethan gardens, are greatly mistaken.

The compilation of a book of the kind at present under consideration naturally takes the form of a series of short chapters dealing individually with each plant; these forming, as it were, a series of pegs on which to hang a collection of apt quotations from old authors, interwoven with critical and informative notes. This the author has endeavoured to give; and, supplemented as it is by a wealth of miscellaneous information, the result is a very readable book. In a few cases, however, the information as to the dates of the introductions of some of the plants may be challenged, as, for instance, 1530 as the "earliest English notice of the cultivated Lettuce." Apart from the fact that it is found in the Anglo-Saxon herbals as "Lactuce," it appears in Alexander Neckam's *De naturis rerum,* written before 1217, as "Lettuce," to be grown in gardens; and in Ion Gardener's *The Feate of Gardening,* c. 1440, as "Letows." In the case of the Potato (mentioned only once by Shakespeare, in a play published in 1602), the old supposition, now held to be untenable, that they were "first brought into England by Sir John Hawkins in the year 1563," is quoted. Perhaps the most interesting point about introductions is a reference to L. W. Dillwyn's *Hortus Collinsonianus,* 1843, p. 60, as to the origin of the name Greengage. The full quotation is as follows: "I was on a visit to Sir William Gage, at Hengrave, near Bury; he was then near 70; he told me that he first brought over, from France, the *Grosse reine Claude,* and introduced it into England, and in compliment to him the Plum was called the Green Gage; this was about the year 1725. P. Collinson." As the Greengage was named "Reine Claude de Bavay" during the reign of Francis the First (1494-1547), in honour of his Queen, Claude de Bavay, it is difficult to believe that it did not find its way to England before the date implied by Peter Collinson. It would be interesting to know whether anyone has succeeded in identifying the "Reine Claude de Bavay" with any of the Plums mentioned by Elizabethan writers, either in print or MS. The Greengage is not mentioned by Shakespeare.

Among the many notes of horticultural interest, the following is well in keeping with the general tone of the book: "Horticulturists might with advantage take a lesson from some of our old-time cottage and farmhouse gardens, where flowers planted carelessly and without foresight as to colour blending yet produce a perfect artistic effect, impossible in the regular mathematical arrangement so noticeable in many places to-day." It is pleasant also to read of the quiet philanthropy of the unknown gentleman who every year sends hundreds of boxes of Sweet Violets, gathered by children, to blind institutions; but what will be said of the local chemist who practically exterminated the Henbane around Stratford-upon-Avon, so diligent was his search for materials to make hyoscyamine?

Whilst not wishing by carping criticisms to detract anything implied as to the freshness and interest of this book, it must be pointed out that it contains many minor errors, chiefly in the capitalisation of some of the specific names. Other points one would be glad to see corrected in a second edition are as follows:—p. 31, the story of Linnaeus falling on his knees before a Gorse bush in flower is now held by authorities to be a myth; p. 87, the story credited to Linnaeus of the doctor dying from his own prescription of Aconite leaves, after a patient had refused to take the medicine, is of doubtful authenticity, and in Dr. B. Daydon Jackson's opinion originated from an account published by Linnaeus's father-in-law, Dr. Johann Moraeus, of a fatal case of Aconite poisoning, where the plant was not taken on medical advice, but eaten by mistake as a salad; p. 318, The best portrait of Gerard is that in the 1597 edition of the *Herball,* which was badly copied on a smaller scale for the engraved title-page of the 1633 [36] edition; p. 407, *Bartholomaeus de Proprietatibus rerum* was not printed (!) in 1398, but only translated into English by John Trevisa at that date.

THE ROSE GARDEN.

ROSE PAX.

Though this Rose has been growing here for three or four years, it is only this summer that it has decidedly impressed me as an acquisition for the garden. Perhaps it was the sudden heat wave we experienced in early July that revealed to me its merits as a decorative Rose. It was then that one became aware of its delicate but diffusive perfume.

This Rose was introduced in 1918 by the Rev. J. H. Pemberton, and being the year of the armistice it was a happy thought of his to christen it Pax. He has been the means of bringing out in recent years several varieties of a new type of garden Rose, the Perpetual Hybrid Musk; and Pax would seem to be his most successful introduction so far in this line, Moonlight, perhaps, taking second place, though I must confess I write with limited experience.

One of the distinguishing features of this class of Rose lies in its scent, which is derived from one of its wild parents, Rosa moschata, the White Musk Rose of the Himalayas. It is quite distinct from the familiar Damask or Tea scent, and disappointing to those unaware of its delicate nature.

It is not, as a rule, revealed to any extent by sniffing the flower, as the Musk and Tea odours are. In fact, I fancy the judgment of the majority on first smelling blooms of Pax would be to declare them as only faintly scented. But on a warm, still summer's evening, by taking a seat in the vicinity of this Rose or by sitting in a room with a bowl of it, one becomes conscious of its pervading odour. It is a scent difficult to describe. To the writer it is neither sweet nor aromatic—a subtle something which pleases and is never overpowering. Mr. Pemberton has referred to it as "a delicate and refined perfume, suggestive of Heather and Lime blossom." Perhaps some noses are more sensitive to it than others, and it may be that one's sense of smell has to become used to it to appreciate it. As Pax has often been mentioned as very fragrant, to prevent disappointment it is well for those who are not yet familar with this variety to know that its fragrance is of this elusive nature and may at times be not at all in evidence.

Though Pax is described as a pure white Rose this statement needs some qualification. The flower has not the snowy whiteness of, say, that of Frau Karl Druschki. It is rather of a milky whiteness and cream coloured before fully expanded. Its pale yellow bud makes quite a pleasing buttonhole for a dark coat. Though often referred to as semi-single, it usually has sufficient petals to merit the term semi-double. These are fairly stout in texture. The bloom when fully out reveals a fine ring of yellow stamens, surrounding a claret-coloured boss of stigmas. The variety is truly perpetual in character and rarely without flowers during the summer and autumn. These are borne in clusters with the individual flowers up to three inches or more in diameter. It has been described as a magnificent Rose, but I think the epithet delightful more aptly fits it.

This vigorous variety is difficult to place as to habit. It cannot strictly be defined as either a bedder, a climber, or a bush Rose. Perhaps the term semi-climber is most applicable. With me it throws up flowering shoots seven feet in height. Its floral wealth may possibly be displayed to the best advantage by training it to a trellis. Its foliage is bold, stout and glossy and resistant to mildew. In this part of the kingdom the wet-withstanding quality of a Rose is of much importance. Though Pax is not ideal in this respect, it is not unduly harmed by rain as to make it undesirable for gardens in the North-West of England.

In penning such notes on Roses let it be understood that the remarks do not necessarily apply to other parts of the country, especially those blessed with a drier and warmer climate. *J. P. Carlisle.*

TREES AND SHRUBS.

ROMNEYA COULTERI.

I enclose a photograph (Fig. 57), which I hope will convey to your readers a fair idea of the beauty of a group of Romneya Coulteri growing in the garden of H. Melville Simons, Esq., The Beeches, Harpsden, Henley-on-Thames. A very small specimen was planted in the autumn of 1917, and this has grown and spread until now the whole clump measures 10 ft. in diameter. Some of the stems measure 7 ft. in height, and the whole group has had as many as eighty flowers expanded at one time. The group is on a sloping bank, in heavy loam containing a fair proportion of lime. The site has a south-west aspect. The plants have had no protection since the original was given a good covering of ashes during the first winter. Another specimen planted on the level ground, has succeeded even better than the one illustrated, but is not in a good position for photographing. Not the least of the charm of Romneya Coulteri is the delicious fragrance emitted by its large white flowers—a fragrance noticeable at some considerable distance from the plants. *W. Oliver.*

A FINE EXAMPLE OF THE MAIDENHAIR TREE (GINKGO BILOBA).

The accompanying illustration (Fig. 58) shows a remarkably fine specimen of the Maidenhair tree, Ginkgo biloba, growing in the grounds of Englefield House, Reading, the residence of J. Hubert Benyon, Esq. The tree is about sixty-five feet high, and its branches have a spread of forty-five feet; the girth of the trunk at the base is eleven feet, and at six feet from the ground the girth is eight feet. This is probably one of the finest trees of its kind in this country. *A. B. Wadds.*

FIG. 53.—A FINE SPECIMEN OF GINKGO BILOBA AT ENGLEFIELD HOUSE GARDENS, READING.

PRUNUS PUDDUM.

A friend has very kindly secured for me some seeds of Prunus puddum from the highlands of Burma. I believe this Cherry to be very close to, if not identical with, P. campanulata of Macimowicz (*Bull. Acad. Sc., St. Petersburg*, XXIX.), a plant which has been described in America as one of the most valuable of Mr. Wilson's introduction into that country. This is indeed high praise, and apparently well deserved, if one may judge by the beautiful plate in Miyoshi's monograph on Japanese Cherries.

As its name suggests, the pendulous flowers are campanulate in form and of a deep rose-red colour. These are said to appear before the foliage (in southern Japan as early as February and March), the leaves being of a very pleasing bright, glossy green hue.

According to Wilson, P. campanulata was introduced into England by Messrs. Sander so long ago as 1899. It would be of interest to know if any of these plants are still in cultivation, and I would personally greatly appreciate any information on this point.

According to my friend, P. puddum can resist at least 5° of frost in its native country, which would suggest that it is capable of outdoor cultivation in the more favoured parts of Great Britain, although Mr. Bean tells me it has proved to be tender at Kew. *Collingwood Ingram, The Grange, Benenden, Kent.*

INDOOR PLANTS.

INSECTIVOROUS PLANTS.

Insectivorous plants are amongst the most interesting members of the vegetable world, and one can derive much pleasure in watching the behaviour of the plants when they are trapping insects. The members include Sarracenia, Drosera, Pinguicula, Dionaea, Darlingtonia, Cephalotus, Heliamphora and Nepenthes, all of which, save the last, thrive under cool treatment in a glasshouse having a winter temperature about 40° to 45°. They need very little artificial heat in the summer, but a moist atmosphere is necessary to their requirements. The house or pit in which they are grown should be kept well moistened and shaded slightly from the mid-day sun. During the winter they should be afforded just sufficient water to keep the soil damp, for it should never be allowed to become dry. If a greenhouse is not available for the plants they will thrive well in a pit or frame, provided frost is kept from them and the temperature maintained about 40° to 45°.

Nepenthes require a stove temperature; they delight in hot, damp places where the atmosphere is heavily charged with moisture.

All insectivorous plants grow naturally in damp bogs, marshes, and similar situations where there is plenty of moisture.

Sarracenia, known as the American Pitcher-plant, has funnel-shaped leaves, which are radical and collected into tufts. The leaves or pitchers are of two forms, one having the lid standing erect, allowing rainwater to enter freely, as in S. purpurea, the other having the lid projecting over the mouth of the pitcher, thus preventing water from falling into it, as in S. variolaris. The under surface of the lid and the mouth of the pitcher are studded with honey-secreting glands forming the attractive surface for flies and other insects. The trapped insects are often so numerous that the pitchers become partially filled with their decomposed mass, and in such cases the pitchers may decay and be spoiled. The best method of preserving the pitchers in perfection is to stop the apertures with pieces of cotton-wool to prevent insects entering. The liquid product of decomposition is probably taken up by the roots, but in cultivation this is not necessary as the plants may, when well rooted, be given a little liquid manure once weekly or fortnightly. In the spring the plant sends up long, slender stalks each of which bears a solitary flower, the style terminating in an umbrella-like expansion.

S. Drummondii, S. flava, S. psittacina and S. purpurea may be cultivated in the bog garden, or on the rockery, where the soil is always moist; but the pitchers on outdoor plants do not develop so finely as when grown under glass. They should be protected from keen winds in severe weather.

Many fine hybrids have been raised from time to time and put into commerce. A few of the best and distinct species and hybrids are (species) S. Drummondii, S. psittacina, S. purpurea, S. flava, S. rubra and S. variolaris; (hybrids) melanorhoda, Chelsonii, Wrigleyana, Courtii, exoniensis and Swaniana; there are many others, but those enumerated are amongst the best.

The plants may be increased by seed or division in the spring. They should be grown in a mixture of fibrous peat and chopped, fresh Sphagnum moss, with a little charcoal and silver sand added.

Droseras, or Sundews, constitute a genus of small herbaceous plants inhabiting marshy and damp places in many parts of the world. They are easily distinguished by their leaves, which are clothed with glandular hairs that secrete a colourless, viscid fluid, giving them the appearance of being studded with dewdrops which look like little sparkling stars. When a fly alights on a leaf it is immediately entangled amongst the glands and soon dies. There is a large number of species of which the following are the most beautiful. D. rotundifolia, this is the well-known British Sundew which may be seen sparkling in the midday sun, growing amongst Sphagnum moss; D. capensis, a pretty little Sundew from S. Africa, with elongated leaves of a light-green colour to which the bright hairs form a pleasing contrast; D. dichotoma, a species from Australia, as curious as it is interesting. The leaves grow erect, attaining a height of from 12 inches to 18 inches, with a petiole as long as the blade. At the extremity of the petiole the leaf divides into four leaflets. This is a strong-growing species. D. spathulata is another Australian species with the habit of D. rotundifolia, but far surpassing that pretty plant in the rich colouring of the glandular hairs, from which the viscid fluid is freely secreted, and remains suspended on the points of the hairs like brilliant pearls; D. binata is similar in growth to D. dichotoma, but a much more slender-growing plant. The glands are redder in colour and more graceful. The Sundews may be increased by seeds and division.

Pinguicula, or Butterwort, requires similar treatment to Drosera, with the addition of keeping water in the saucer below the pot in which the plant is grown.

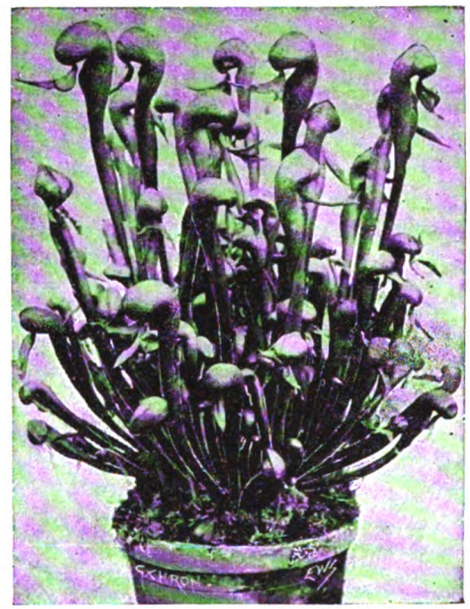

FIG. 59.—DARLINGTONIA CALIFORNICA.

Dionaea is popularly known as Venus's Flytrap. D. muscipula is a very interesting little plant which has received the name of "flytrap" from a curious trap-like formation on the edges of the two semi-circular lobes of the leaves, which are fringed with rigid hairs. Each lobe has three delicate hair-like organs on its inner surface, which, being sensitive, close the leaf immediately they are touched by an insect, or any light substance.

Darlingtonia californica (see Fig. 59) has erect pitchers rising spirally in dense, irregular clusters. The tops of the pitchers are turned over like an inverted boat, and in their mature state lose the crimson colour which is so conspicuous in the veins when they first appear.

Cephalotus follicularis is a very beautiful and interesting Australian Pitcher plant that may be termed stemless. It produces its pitchers of green and purple on petioles, or foot stalks about an inch in length, with freedom. The pitchers are about 1 inch to 1½ inch in length and furnished with two parallel wings in front and two oblique ones on the sides, all of which are ciliated. The lid, which covers the mouth of the pitcher, leaves but a small aperture, is regularly furrowed and very hairy.

Heliamphora nutans (see Fig. 60), allied to Sarracenia, is a very rare plant introduced from British Guiana by Messrs. James Veitch and Sons of Chelsea, and flowered by them for the first time in 1889. It differs from Sarracenia in having several flowers, which are destitute of a corolla, on a scape. The colour of the flower is pale rose.

The plant is increased by division and seed and may be grown in similar soil to the other insectivorous plants. All these interesting plants may be cultivated easily with very little labour or expense. *John Heal, V.M.H.*

LACHENALIAS.

These are charming subjects for the cool greenhouse, and succeed under the same treatment as given to Nerines; only it is best to repot the plants every year in a compost consisting of good loam, leaf-mould and dried cow manure with sand added.

The plants are best grown in 48-sized pots, or in pans six or seven inches in diameter; some growers favour basket cultivation for them, but I do not think their habit suits them for growing in baskets.

The small bulbs should be placed separately in pans or boxes and grown on for next year. There are several species, but those most commonly cultivated are L. tricolor and its varieties, and L. Nelsonii, a garden hybrid and one of the prettiest of the race. *J. C.*

INDIAN CORRESPONDENCE.

GARDENERS' WAGES.

While sympathising with those who have been expressing their financial troubles recently in the *Gard. Chron.*, I cannot help thinking that some have forgotten the contract they made with their employer on engagement. While I have no sympathy with employers who starve their employees, it must be remembered that, after all, they are but human, and have the prevailing habit of always trying to obtain a good article at the lowest cost, especially if they are business men, and many refuse to go beyond the contract price until driven to it by cancellation of an agreement. All employers have not the same interest in gardens, and they vary considerably in their tastes, which require studying. If artistic, they are sure to be fond of flowers and artistic surroundings. If they are fond of racing and sport, they will like plenty of good fruit and vegetables, and have a keen desire to have everything better than their neighbours—a desire to win every time.

The coming of the motor-car has lessened the old interest in home life and gardens. Taxation has also killed a great deal of interest, but the genuine lover of nature and all things beautiful remains unaffected by either, and fortunate are they who have such a man for an employer. I am sure there are still many employers who are ever ready to reciprocate friendship and generous dealing when met half-way by the employee. Many gardeners gain advancement through a genuine love of their work, their unselfishness, tolerance, and forbearance, and their determination to please by growing everything to the highest possible standard, and by their knowledge of what not to do—I place plenty of emphasis on the latter. There have always been good, bad, and indifferent gardeners, and always will be; but good, wide-awake men seldom fail to make their mark, if not their fortune. It is as well to remember—and I speak from experience of over forty years—that money is not everything. I can look back with real pleasure to years I spent under ideal employers in England on a moderate salary of £100 and less.

It is a grand experience to be home, within easy reach of the best shows, to compare notes with one's neighbours, to get fond of the plants and trees, to make little pictures with them that never fail to attract, to hear expressions of delight and encouragement, and to live in a temperate climate amongst one's own countrymen, in a Christian country, a land noted for its justice, fairness, morality and truth—England. *George Burrows, Superintendent of State Gardens, Patiala, India.*

MARKET FRUIT GARDEN.

The first half of August was hot and sunny, but after the 16th there were only two days without rain. On the 29th there was a strong gale, which brought down a great deal of fruit; and the temperature during the latter part of the month was often unseasonably low. The total rainfall amounted to 2.31 in., which is not excessive for August; but the low temperature and lack of sunshine retarded the ripening of fruit. Weeds grew apace, and opportunities for effective cultivation were few. Thus the season continues to be thoroughly unfavourable for fruit-growing.

Plums and Apples.

The crops of Plums and Apples are proving even more disappointing than was anticipated. Rivers' Early Prolific Plums, for instance, which hardly ever fail me, yielded 148 half-sieves, as compared with 907 last year; and Czar gave 56 half-sieves against 333. Unfortunately prices, though good, were not high enough to compensate for the lack of quantity, this being due to the heavy imports of Continental Plums, the French crops being of exceptionally good quality this year. I look forward, however, to better fortune with the later varieties, as prices are rising with the decline of imports. There are light crops of Pond's Seedling and President to be picked; but I have quite full yields of Victoria and Monarch.

I find that the way to make the most of such a light crop is to pick over several times to catch the fruit when fully ripe, and send to market in chip baskets holding 7 lb. The fruit then sells for dessert for a good deal more than if packed in half-sieves. In a season of plen- it is more important to pick as early as possible, when the fruit is coloured but still firm.

The Apple crop is still more disappointing. Even where the yield appears to be fair on the trees, the crop when picked does not bulk well, owing to the big proportion of small fruit. Some of the cooking varieties, such as Lord Derby, Warner's King and Royal Jubilee, have been exceptions; and such fruit of good size has sold very well. But the dessert varieties are very short, and of rough appearance, though the flavour, for some reason or other, is unusually good. Beauty of Bath, generally a strong feature with me, was very scarce; Worcester Pearmain is small and scabby; and Cox's Orange Pippin will hardly be worth talking about.

The Apples are being marketed as quickly as possible, as prices are probably now at their highest level. There are big crops in Canada and the United States; and the growers know that there is a shortage in this country, and are starting shipments early. There were Californian Apples on the London market at the end of August. This year home-grown Apples have had the market to themselves for a few weeks only.

Retailers' Profits.

Retailers were let off lightly in the report of the Departmental Committee on the Distribution of Fruit and Vegetables. As much of my fruit goes to a neighbouring town, I am able to keep an eye on the shops, and compare the prices at which they offer it to the public with the prices which they have to pay the commission salesman. Chip baskets containing 7 lb. net of Plums realised 4s. 6d. each gross. This is a good price and I do not complain of it; but I thought that the retailers would sell the baskets intact to the public with, say, a shilling margin. Instead of this they sold the fruit at 1s. (and even 1s. 2d.) per lb., thus clearing 4½d. per lb., or 2s. 5d. per basket. Rivers' Early Prolific Plums were sold to the shops, at one time, at 10s. per half-sieve of 28 lb., which works out at 4¼d. per lb. These were offered to the public at 7d. per lb., equal to 16s. 4d. per half-sieve, a margin of 6s. 4d. Worcester Pearmain Apples sold wholesale at 9s. 6d. per half-sieve of 20 lb., or 5¾d. per lb., were retailed at 9d. per lb., leaving a margin of 3¼d. per lb., or 5s. 6d. per half-sieve. The retailer's excuse would be that much fruit goes bad on his hands, and that there is loss on weighing out in small amounts. I contend that, even if we allow for this, the retailer is still getting an unfair share of the profit. As a matter of fact, there could be little waste with this fruit, if any, because it was all most carefully graded for size and quality. I do not complain of the prices I received, which were good; but I do resent the retailer taking an unfair share, and at the same time restricting output.

Bush Fruit Farms.

I believe that the growers who have done best this year are the specialists in bush fruits, who are mostly small holders. The heaviest crops of Black Currants have been grown by cultivators of a few acres; and the specialists in big dessert gooseberries have done well. Fungous diseases are making it almost impossible to grow satisfactory crops of such subjects on rough-and-ready lines between orchard trees. Bush fruit culture must pass more and more into the hands of small growers, who give the crops special attention and do most of their cultivation by hand. Those who think of taking up fruit-growing for a living might be well advised to establish bush fruit farms instead of adding to the acreage under orchard trees, which already threatens to become too extensive.

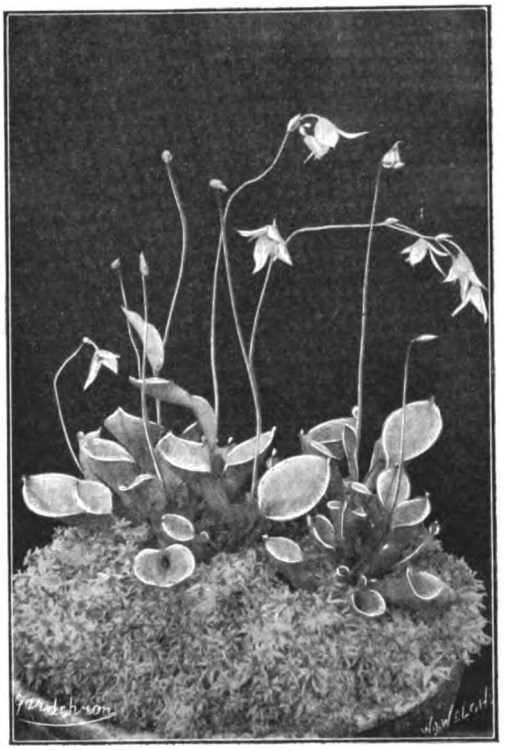

FIG. 60.—HELIAMPHORA NUTANS (SEE P. 160).

Wasps and Aphides.

In seasons when aphides are unusually troublesome, we are generally told by naturalists that it is because we kill off their natural enemies the wasps. This year we have had both aphides and wasps in plenty, and it cannot be said that the wasps have suppressed the aphides to any noticeable extent. They came too late to do much good in this direction, and they are in themselves a serious plague, because of the fruit they spoil. Nests have been numerous and very strong. I have destroyed a great many. At the beginning of the season I used carbon bisulphide, which answered very well provided that the entrance to the nest led downwards, so that the heavy gas could penetrate. In the side of a bank it is not so certain in results. I have now gone back to cyanide of potassium. One does not care to have this about, on account of its very poisonous nature, but it appears to be the most satisfactory wasp-destroyer. A small lump can be dropped into the entrance to the nest, or a solution can be made and used on wads of cotton-wool; and it does not matter whether the work be done by day or night.

Staking Young Trees.

A gale like that experienced during August finds out faults in the staking and tying of young trees. If the binding material has become rotten it parts, and the stem is soon damaged against the top of the stake. If the stake snaps the tree is blown over and the root-hold loosened. The best stakes I have used are made from Sweet Chestnut poles, with the ends pointed and the part that is to be driven into the ground coated with creosote, which gives a longer life than tar. For tying I like thick, soft cord, known locally as hay cord. This is passed round twice so as to enclose both tree and stake, the tree being held away from the stake a few inches. The ends of the cord are then brought round between the tree and stake, twisted round the strands of cord several times, and tied. This forms a cushion of cord (including the knot) which serves to keep the tree away from the stake, and yet holds it securely. The job is easy to do, but difficult to describe.

Half-Cultivated Orchards.

So far I am satisfied with the method of half-cultivation adopted in the older plantations this year. The alleys between the rows of trees are cultivated by horse-drawn implements, but a strip about 6 ft. wide on which the trees actually stand, is left under grass instead of being hoed by hand as hitherto. The grass is cut twice in the season and allowed to rot where it lies. The saving of labour as against clean cultivation over the whole area is very considerable, and I hope that results will be better than if the orchard were grassed down entirely. I read in a contemporary that this method of half-cultivation is quite recognised in Canada, where it is called the sod strip method. I am glad to learn that one of the benefits which I hoped to gain from it, the higher colouring of the fruit as compared with that grown under clean cultivation, is secured in Canada. In that country, however, a cover crop is sown on the cultivated strips in July, and ploughed under in spring, thus acting as a substitute for organic manures. *Market Grower.*

LOCAL PLUMS.

Anyone visiting a fruit market in Worcestershire—Evesham or Pershore—in September would see a predominance of that Plum which is common to the county and is known as the Yellow Egg or Pershore. It is one of the commonest of Plums—in many private gardens it is not represented at all—and yet it is one of the most valuable. If Worcestershire fruit-growers were asked what they think about it they would admit the merits of Prolific, Czar, Monarch and the rest, deplore the devastation caused amongst Victoria by silver leaf, but they would sing loudest of all the praises of the native Yellow Egg Plums, which fill the baskets and pay the rent. Last year there was a glut of Plums and one heard stories of tons of Pershores that were never picked but rotted on the ground. This statement is not denied, but in spite of it probably Pershore realised more money than any other variety, because it has two markets—green and ripe—and the yield per tree was enormous.

This is admittedly a bad Plum year, yet in the Worcestershire markets there are more Pershore Plums than any other sort, which confirms the local contention that "Egg" Plums bear when other varieties fail, and growers who are fortunate in having a crop have nothing to complain of as regards the price. The vitality of the tree, too, is extraordinary. It does not grow very big, and consequently the Pershore Plum trees are planted closely together; if the variety cropped less heavily it would probably be more robust. In the early part of this summer the Pershore Plum trees presented a pitiable appearance. The leaves which in the first place were curled and crippled through aphis, afterwards turned brown, and the trees looked as though they had been scorced by fire. It seemed as though they could not recover and

Digitized by Google

must die, but the aphis departed, a new crop of leaves appeared, and in addition to now looking fresh and healthy, many of the trees that suffered severely have brought fair crops of fruit to maturity.

It is no exaggeration to say that the Egg Plum is an institution of great commercial importance in Worcestershire. Indeed, one might go further and claim that the development of the important fruit-growing industry in the county is due more to the Pershore Plum than anything else. Nature originated it in the district which bears its name, and while there are now Red Pershore and Purple Egg Plums, I do not think the yellow-fruited parent is likely to be superseded. Propagation is an easy matter, as trees throw up suckers from the roots to such an extent as to become a nuisance, and these suckers are removed and transplanted to make future trees. In short, the story of the Pershore Plum is also the story of the growth of the fruit-growing industry in Worcestershire, with one factor added, namely, the "Evesham custom" as it is applied to the tenure of market gardens and fruit plantations, and gives a security that farmers cannot be said to enjoy. No wonder that Worcestershire folk think a lot of their native Plum, because if Nature had never introduced it and the Evesham custom respecting land tenure had not been devised, the county, confined to agriculture, would never have been as productive and prosperous as it is to-day.

In the adjoining county of Gloucestershire, in the orchard lands along the Severn Vale, there is another local Plum which, if not so famous as the Pershore, owing to the fact that it has not been known so long, is eagerly sought after in September in the fruit markets at Gloucester and Grange Court. The Plum I refer to is the Blaisdon Red, named after the little village on the borders of the Forest of Dean, where it originated as one of Nature's accidents less than a century ago. The story goes that an Apricot tree grew on a farmhouse wall at Blaisdon, and as Apricots often do, the tree died. A Plum shoot, however, grew up from the root, and it was left probably more by accident than design until it bore fruit. The tree threw up more suckers, and, little by little, trees of Blaisdon Red were planted first in the village and then in surrounding parishes until now there are thousands of trees in the Severn Vale, while the number increases every year. This story of the origin of Blaisdon Red may or may not be strictly true, but it is accepted for the want of a better—there could hardly be a prettier. Now as to the effect that act of Nature has had on this particular part of Gloucestershire. In the first place the Plum trees, costing little or nothing beyond the labour of planting, have brought considerable grist to the mills of farmers and small holders. They have brought profit to land that returned very little revenue before, and have more than doubled the capital value of such land. If there is a hardier or more vigorous Plum than Blaisdon Red I have yet to see it, and it has the merit, not enjoyed by many varieties, of thriving on grass land. In colour the Plum is red, oval in shape, it travels well and is not affected by wet weather. Last year there was a glut of Blaisdon Red, prices ruled low, and some crops were not picked, but the big trees bear such heavy burdens that I question whether under glut conditions any other variety paid as well as this did

This season the story is different. By comparison with last year, Blaisdon Red Plums are scarce, but orchards here and there have yielded fruits, and the shortage is reflected in the prices realised. For jam-making and bottling, Blaisdon Red is highly favoured, but with the present state of the jam trade and the price of sugar it may be as well perhaps that crops are not heavy this year. When it is realised how the Blaisdon Red Plum has almost created an industry one cannot help thinking how that first tree of it raised by accident, so to say, might easily have been destroyed; consequently its preservation has proved a blessing to farmers and fruit-growers in the Severn Vale and the borders of the Forest of Dean.

Concerning both the Plums I have referred to some people talk pessimistically about too many Pershores and too many Blaisdon Reds being planted, but there need be no fear of this if the methods of distribution are looked after and improved. We are not likely to grow more Plums in the country than the population can consume, provided the producer and the consumer can be brought closer together and there is also a considerable fall in the price of sugar. Even last year, when Plums were rotting under the trees in Gloucestershire, there were people who could not obtain them, and railway companies were paid more for carrying the fruit from one part of the country to another than the growers obtained for producing it. *G. H. H.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(Sèe Tables and Summaries, Ante, pp. 71-76.)

(*Continued from page* 149.)

ENGLAND, S.

KENT.—Fruit crops generally are under the average, no doubt owing to cold nights and east winds when the trees were blooming, and these damp nights were accompanied by very low temperature. Our soil overlies chalk. *John Thomas Shann, Betteshanger Park Gardens, Eastry, Dover.*

——Never had fruit trees looked more promising than in the spring of this year, the orchards being sheets of bloom, but a cold and unusually sunless spring brought many evils in its train, and in many cases the fruit trees have rarely looked worse. Aphis on Apples and Cherries made a filthy deposit on the foliage, and where spraying was not carried out the growth was crippled and the trees look most unhealthy. Though almost sunless, little rain fell in June, consequently the trees got no natural cleansing, and the abnormal heat wave which set in early in July found most things unprepared, and the grower has, in many instances, had a very bad season. Strawberries, which looked especially promising at one time, were stunted and starved by the drought and cold nights, and did not develop properly. *J. G. Weston*, 30, *North Street, Ashford.*

MIDDLESEX.—Peaches are good and the trees healthy. Apples are a plentiful crop, notwithstanding early in the season the leaves suffered very much through frost and cold nights, also insects. Pear trees failed to bloom, consequently we have no Pears. Plums at one time promised well, but the tiny fruits dropped wholesale and left only a moderate quantity to mature—and the same remarks applies to Cherries. Gooseberries were very good, but Raspberries and Currants were poor; Strawberries were satisfactory. I attribute this to placing a slight covering of straw over the flowers during the frosty nights that we experienced when the blossoms were expanded. The soil here is light and porous. *H. Markham, Wrotham Park Gardens, Barnet.*

——The promise of a wonderful year for fruit has unfortunately not been fulfilled. Pear trees in general developed little blossom, although some sorts, Pitmaston Duchess, Duchess d'Angoulême, Gratioli de Jersey, in particular, were heavily laden, but none of it set. Plums were a fine sight when in flower, and much of the blossom seemed to set only to fall later. Apples, Raspberries and Strawberries are the only satisfactory fruits. Aphis of all kinds have been a positive plague. Morello Cherries were crippled and the fruit dropped, although the trees had been repeatedly washed. Altogether it is a very discouraging year for fruit. *Geo. H. Head, Fulweil Park Gardens, Twickenham.*

SURREY.—The fruit crops generally in this district are very poor. In places there is a medium crop of Apples. At Catton, such kinds as King of the Pippins and Wealthy are good average crops. Bramley's Seedling is also fruiting well, excepting on the young trees. Pears are nearly a complete failure. Plums are scarce. Victoria trees on walls are bearing a fair crop, but we have only a very few Gages. Cherries were very scarce. Peaches and Nectarines are both bad crops. Apricots set well, but the fruit dropped during the stoning period. *J. Collier, Catton Park Gardens, Reigate.*

——The fruit prospects in this neighbourhood are generally poor, there being only about one-third the usual crops. Pears are a failure. Apples developed plenty of blossom, which gave good hopes, but the preceding year had been most unfavourable to the ripening of the wood. This, with swarms of all kinds of pests, marred our hopes for a good fruit harvest. For miles round these gardens the foliage of many fruit trees is completely riddled by insects. Black Currants suffered in a similar manner. Strawberries have been small and of poor quality. Gooseberries, Red Currants and Raspberries were all heavy crops of fine quality. Our soil is heavy Sussex clay. *F. Jordan, Ford Manor Gardens, Lingfield.*

——With the exception of Pears, the various fruits blossomed freely, but the very unfavourable weather conditions of early summer greatly hindered the development of the fruits. Much of the Plum blossom was damaged by frost or by cold wind. Gooseberries were a heavy crop, and the quality seemed to be above that of recent years. Strawberries gave early promise of good crops but finished badly, as also have Raspberries. *Alan N. Rawes, R.H.S. Gardens, Wisley, Ripley.*

——The fruit crops are very disappointing. Pears, Plums and Damsons are all absolute failures. The trees were covered with blossom, and during that period we had three severe frosts registering 12°, which was 4° higher than in any of the winter months. Apples are a poor crop, but the quality is good. Strawberries were abundant, the size and quantity of the fruits being easily a record, although the ripening period commenced a fortnight later than usual. Our soil is very light and porous, resting on chalk. *H. Prince, Polesden Lacey Gardens, Dorking.*

SUSSEX.—There was every prospect of good fruit crops here until the beginning of May, when we had several sharp frosts and fierce gales until nearly the end of June. I do not remember a worse May and June; it was very disheartening to see most crops at a standstill for so long through cold. Of small fruits Gooseberry were an average number, and very good. Strawberries were also satisfactory, but all kinds of Currants were under the average yield and of bad quality. Raspberries were an average crop. *H. Cook, Glynde Place Gardens, Glynde.*

——Orchard trees generally, with the exception of Pears, blossomed profusely, and in many cases a satisfactory crop of fruit set; but this has since been thinned severely by adverse weather, insect pests, and diseases. A large proportion of Apples will be small and scabby. Amongst bush fruits Gooseberries and Red Currants were heavy crops, Black Currants moderate, and Raspberries light. Strawberries had a prolonged season, and were of good quality. The season is remarkable for the slow development of fruit and the prevalence of pests and diseases. *E. M. Bear, Mayham Down, Hailsham.*

——We have the lightest crops of Apples and Pears at Gravetye for many years, which may be due to various causes, such as the extraordinary crops borne in the previous year, and lack of sunshine during the latter half of 1922. Many Pear trees failed to produce flowers, yet trees of a few sorts were conspicuous during the flowering season, and have set good crops of fruit. Trees of Apple Lane's Prince Albert flowered very late and were a mass of bloom, but scarcely any of the flowers set. Codlin Apples are a heavy crop, and an occasional tree of Bramley's Seedling is loaded. There are, however, many trees without fruit. All fruit trees, and especially Plums, suffered severely from aphis and caterpillar, and while a tree here and there of the latter carries a good crop, many are barren. Small fruits were plentiful and good; Raspberries decidedly so. *Ernest Markham, Gravetye Manor Gardens, East Grinstead.*

HOME CORRESPONDENCE.

British Bulbs—or Dutch?—The bulb season having arrived, the "trade" is in its usual panic about the wiles of the wicked Dutchmen. Members of the H.T.A. have circulated a reprint from *Truth* warning gardeners of the dangers of buying their bulbs abroad. This sort of propaganda is futile, and likely to defeat the very object it sets out to achieve for British firms, because commonsense will lead any reader of this pamphlet to detect the motives of prejudice, selfishness and unfairness which underlie it. I hold no brief for unfair foreign competition, but many cultivators of bulbs have purchased their requirements from abroad for years, and will continue to do so, from Dutch houses of repute, and in cases where they have been disappointed by questionable suppliers they will try elsewhere. Only, they will study bulb advertisements with greater caution and place their orders against those announcements from which they derive confidence. The right way to get at the British buyer is to convince him, through advertising, of the better service and guarantees he secures by purchasing his bulbs in this country, instead of leaving advertising initiative to the foreigner. The gardening papers are refusing hundreds of pounds worth of advertising business every autumn from Dutch firms in order to placate the British trader; business which is only passed on to the daily press. This sacrifice on the part of horticultural journals is not, however, rewarded by the support of the majority of bulb firms in this country, whose one-sided position cannot for long remain tenable. If they call upon the gardening Press to restrict the foreigner, they must see that there is some justification for it, as well as an alternative, otherwise the Press must be allowed that free hand which the dailies exercise. After all, is there not such a thing as the freedom of the Press? *A. J. G. Surrey.*

Pelargonium Rollison's Unique.—Until I read Mr. Lynch's most interesting notes (p. 84), this old favourite greenhouse plant had quite gone out of my memory. What memories are conjured up by the name! Rollison's, of Tooting; Mileham, the Orchid grower; Shelstone, the soft-wooded grower and traveller. With what pride we were shown the well-grown Vandas by the former, and the fine trained specimens of Mrs. Pollock, Star of India and other tricolor Pelargoniums, then in the heights of their fame! The Ericas and other hard-wooded plants were also well grown and shown by this noted firm. Pelargonium Rollison's Unique, with its grey, woolly foliage, which sets off the purple flowers, was a great favourite at that time, for cultivation in baskets, for trailing over the conservatory stage, or training up a wall indoors or out; it was always attractive. It is pleasing to know that it has not entirely gone out of cultivation. *C. Orchard, Smoglands, Bembridge, I.O.W.*

Bokhara Clover.—I have read with interest and pleasure Messrs. Wm. Power and Co.'s letter *re* the above on p. 136 of *The Gardeners' Chronicle* for September 1. Having handled the original variety for more than fifty years and seen the plant growing in three different Continents (including eight European countries and the United States from the Atlantic to the Pacific) for fodder and for bees, I felt, and still feel, justified in expressing the opinion I did respecting its value and use. Messrs. Power are, I doubt not, more fully equipped than I am to appraise its merit for culture in Ireland, but the crops that have come under my notice in England under good and bad soil and cultivation have only given the most meagre support to the grotesque statements in favour of Bokhara Clover contained in the newspaper article with which my letter was chiefly concerned. Such statements as "which contains the secret of England's independence of foreign meat supplies, and may change the course of Britain's economic history" may mislead credulous farmers not well posted in these matters, and ought, in my opinion, to be thoroughly exposed. I know the plant is well adapted for bees, because I have many times seen it demonstrated on a very large scale, and there is a market for an unlimited amount of honey at a reasonable price. But as a forage crop, unless the land really will not grow anything better, I still assert that the farmer will be well advised to neglect it and devote his attention to such portions of his farm as will produce even small crops of Lucerne, Berseem or other crops of tried and proved value. I did not for a moment think of comparing it with Swede, Mangel or Cabbage. *S. B. D.*

The Runner Bean.—I am greatly indebted to Mr. C. Capp, of the Old Abbey Gardens, Leiston, and K., Dublin, for their interesting and, I think, important communications on the advantages of cropping from two, three and even seven year old plants of Runner Beans (see p. 121, August 25). Runner Beans are often preferred to French or Kidney Beans, and there is no small advantage in obtaining early crops. Of this there is now good evidence, but it is not always done, even where there could be no difficulty about it. I think I could say this for at least one gardener in Cornwall. With reference to Torquay, I find by inquiry that one market grower, while aware of the earlier crop to be obtained from plants that have come through the winter, is unable to benefit because he requires the ground for another crop. The difficulty, however, is apparently removed by Mr. Capp's plan of taking up and storing the roots. It is a plan that might, perhaps, be often adopted. I have heard also from another grower, who mentions the larger crop to be obtained the second year, but he also refers to the difficulty of sparing the requisite ground. My finest Bean of last year's sowing, obediently twining on a string against a wall, though under the worst conditions of poor soil and light, is now twelve feet high with good foliage, and has flowers or buds at all the joints nearly to the base, but it is evidently unable to bear fruit. If I had the opportunity I should certainly be tempted to try an experiment with some plants against a wall in good soil and exposure, perhaps in the spaces between fruit trees. *R. Irwin Lynch.*

SOCIETIES.

NATIONAL DAHLIA.

SEPTEMBER 5.—The National Dahlia Society is to be congratulated on the success of the Society's annual show, which was held in the R.H.S. Hall, Westminster, on this date. A week previously the devastating gale, which raged over the country, had damaged so many plants that the expectations of a good show were damped considerably. But under the influence of more genial weather the plants revived and produced sufficient flowers to make an exceedingly interesting display. Some of the trade growers found themselves unable to bring representative collections, but others were in a more fortunate position. The general quality of the blooms was high, and in many cases the competition was good. The new classes, which the committee had arranged with the object of encouraging the purely amateur grower who tends his garden unaided, proved to be very successful and attracted a gratifying number of entries.

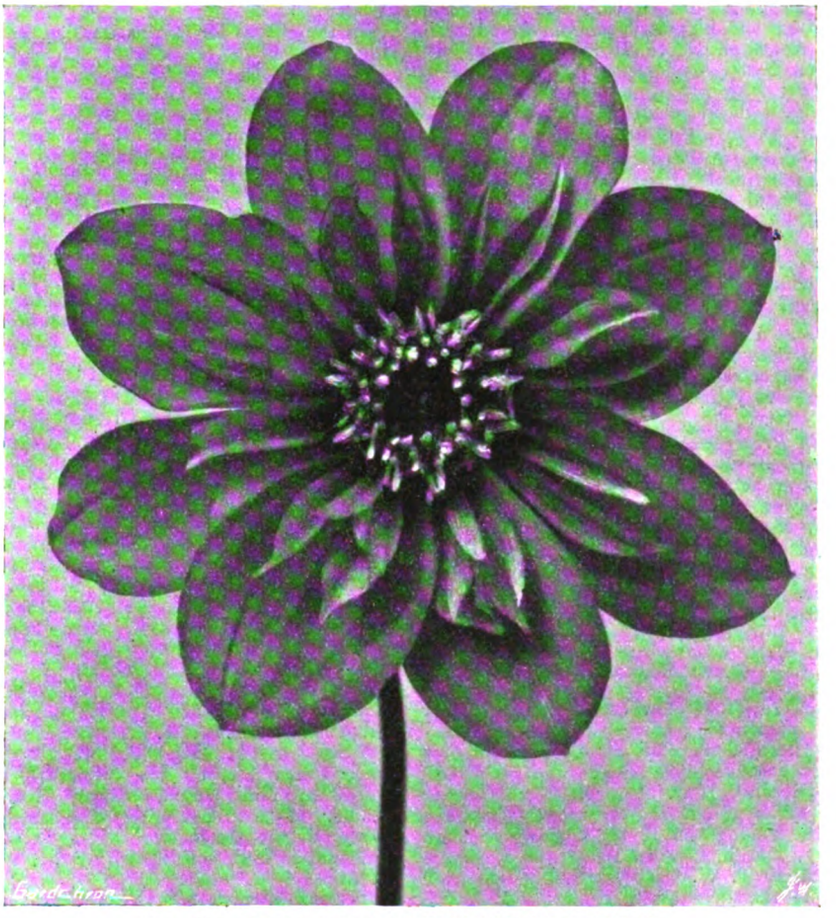

FIG. 61.—NEW COLLERETTE DAHLIA MRS. PERRY.

NEW DAHLIAS.

The Joint Dahlia Committee of the R.H.S. and the N.D.S. which sat at 2 p.m., found no fewer than 43 seedlings awaiting judgment, and selected the ten following novelties for trial at Wisley:—

Thomas Ewbank (see Fig. 55).—A Paeony-flowered variety, coloured Geranium-scarlet in the centre, passing to rose at the tips and the outer florets, a pretty combination of colouring. The florets are quilled and are almost pointed at the tips. The stems are very dark in colour and of a stiff, wiry nature, so that the bloom is held well erect. Shown by Mr. A. J. COBB, University College Gardens, Reading.

Mrs. Perry (see Fig. 61).—A very fine collerette variety of good form, and somewhat of a new break, for the segments forming the collar lie almost flat against the florets. The colour of both the florets and collar is light crimson. Shown by Messrs. W. TRESEDER, LTD.

Digitized by Google

Thomas Want.—A Cactus variety of the large exhibition type, the flower measuring eight inches across. The florets, which are a beautiful shade of coral red, incurve toward the centre and the edges are rolled back, forming more or less fluted segments.

Zebra.—A compact exhibition Cactus variety with white florets striped and spotted with deep crimson. In this case also the florets are incurved toward the centre and rolled back at the edges. The flower stem is stout and stiff, a desirable quality in the Cactus type of flower. These three varieties were shown by Messrs. STREDWICK AND SON.

Victory.—A large decorative variety of rosy-mauve colour, with a dull fawn centre. The blooms are developed on fine, stiff stems.

Amun Rar.—A decorative variety of the largest size; the biggest bloom measured nine inches across each way. It is a very shapely flower and has a good centre. The colour is pale apricot with a rosy suffusion, the central florets being a darker shade. Shown by Mr. H. WOOLMAN, Shirley, Birmingham.

Little Jenny.—A charming single variety of very attractive colouring. There is a ring of crimson around the golden centre, and this is succeeded by saffron yellow, which passes to pale rosy-pink at the tips of the florets. The whole flower seems to carry a delicate sheen or bloom, which greatly enhances its beauty. Shown by Messrs. TRESEDER, LTD.

Defiance.—A miniature Paeony-flowered variety of deep reddish-orange colour. Judging by the number of buds carried by the growths the plant is very free blooming and an excellent garden variety.

Nutfield Priory.—A miniature Paeony variety of pale orange colour on a gold ground, the base of the florets being wholly yellow. It is a companion flower to the above. Both these were shown by Messrs. J. CHEAL AND SONS.

Vie la France.—Another Paeony-flowered variety, but of deep, clear crimson colour. The stems are very dark, almost black, and the foliage also is very dark. Shown by Mr. A. J. COBB.

OPEN CLASSES.

Messrs. W. TRESEDER, LTD., were alone in the two classes for show and fancy Dahlias, but they were deservedly awarded both first prizes for excellent collections. Of their 24 blooms, distinct, Mr. Chamberlain, Charles Wood, Warrior and Mrs. Sanders were the very best, while among the 12 we selected Duchess of Albany, Merlin, Charles Wood and a beautiful sport from T. W. GIRDLESTONE, as being of much more than average merit.

In the classes for show Cactus varieties, Messrs. J. STREDWICK AND SON were, as usual, pre-eminent. They were awarded the first prizes for (a) 18 varieties, six blooms of each; (b) 24 blooms, distinct; and (c) six blooms, distinct. Of the many good varieties staged, the following were of outstanding merit: Fellows Martin, Silverhill Park, Mrs. A. T. Barnes, Mammoth Supreme, Gloriosa, Highwayman and Lucien. The best 12 Cactus varieties, shown on boards, were displayed by Mr. H. WOOLMAN, who included superb blooms of Abbotsford, Meridian, Mammoth and Miss C. A. Gilliatt.

The first prize for 12 vases of Cactus varieties was awarded to Messrs. J. CHEAL AND SONS for a very beautiful collection of decorative varieties of such sorts as Queen of Pinks and Mrs. H. B. Brandt. They were also first in the classes for (a) six miniature Cactus varieties; (b) 24 Pompon varieties; (c) 12 Pompon varieties; (d) 24 varieties of Single Dahlias; (e) six varieties, large Paeony-flowered; (f) six varieties, small Paeony-flowered; and (g) both classes for Collerettes. Of the last-named they had well-formed, typical specimens of Scarlet Queen, Vera, Henri Farman, Mrs. J. Courtold and Miss Short. Amongst the Pompons, Daisy, Irene, Silver Queen and Regulus, of those on wire frames, were daintily beautiful, while the vases of Girlie, Electra, Daisy and Gwyn were particularly charming in their formal shape and lovely colouring. Marie, Leon and Kitty were delightful examples of the show singles. The Paeony-flowered varieties included Ethel May, Yellow Prince (large), Leonie Cobb, Rosie and Hector (small).

Among the six varieties of Large Decoratives so well shown by Mr. H. WOOLMAN, were magnificent vases of President Wilson, Futurity and Fireflame.

AMATEURS' CLASSES.

The general quality of the blooms in the amateurs' section was particularly good, and was continued in the new classes for amateurs who do not employ paid assistance in their gardens. The principal amateur prize-winners were: Mrs. GUINNESS, Mr. W. J. CRAMP, Mr. A. T. BARNES, Mr. A. BROWN, Mr. A. F. TOFIELD, Mr. M. HOWARD and Mr. S. H. WHITE.

In the classes for Cactus Dahlias the outstanding varieties were Saffron, Abbotsford, Mrs. Harvey, Edith Page, Canary, Miss Stredwick, Sidney Jones and Edgar S. Jackson. The Pompons in the amateurs' section were the best of their type in the show, and the tiny, perfectly formed blooms were of such varieties as Glow, Bacchus and Sunset.

The decorative classes were very popular and added materially to the attractions of the exhibition. Mrs. A. R. BIDE won both first prizes in the dinner table and the basket classes with artistic arrangements. Mr. FRED. TRESEDER won first prizes with boldly arranged vases and bowls of Dahlias, which were greatly admired.

TRADE GROUPS.

The large collections of Dahlias so well arranged by the principal trade growers were magnificent displays. Messrs. CARTER, PAGE AND CO. filled a very large space with an up-to-date collection of all types, though we believe the judges considered only the regulation 30 feet run of this exhibit when making awards. They had big stands of Coronation, a scarlet miniature Cactus; Our Annie, small decorative; Sweet Briar; Masterpiece, a broad-petalled Cactus of pale lavender colouring; Winter Queen, white decorative; Mr. Dressel-Huys, soft shell-pink Decorative and Pothos, a blue Decorative (Large Gold Medal).

In a smaller collection of exceedingly fresh and perfectly formed blooms, arranged with great skill, Mr. J. T. WEST included a surprising variety: Magnet, Pink Pearl, Abundance and Willia, of the miniature decorative varieties, and Olivia, Vixen, Sparkler and Gallus of the charming miniature Paeony-flowered, are the names of only a few of the splendid sorts so well shown by Mr. West (Gold Medal).

A very attractive style of arrangement was adopted by Messrs. JARMAN AND CO., whose elegant baskets contained beautiful blooms, such as Joyce Goddard, an orange and scarlet Cactus; Rose Supreme, and Royal Standard (Silver-Gilt Medal).

Messrs. J. CHEAL AND SONS added materially to the group they showed on the previous day, and included such varieties as Cassandra, Harold, La France, Lorna and, amongst the Star varieties, Surrey Star, Lowfield Star, Coral Star and Horley Star. A basket of Coltness Gem well illustrated the value of this dwarf variety for bedding purposes, and the adjoining basket of Mincio was even brighter (Silver-Gilt Medal).

Near the door Mr. CHAS. TURNER arranged a small collection of very good varieties (Silver Medal). The CENTRAL GARDENS SUPPLIES associated their Dahlias with Gypsophila paniculata and foliage, and by so doing made a very attractive display as well as showing good Dahlias (Silver Medal). At various points around the hall there were miscellaneous collections which added to the interest of the show and especially pleased those of the visitors who do not attend the fortnightly meetings. The National Dahlia Society made awards of medals to these groups, the chief of which were Messrs. SUTTON AND SONS, Gold Medal for Montbretias; Messrs. KELWAY AND SONS and Messrs. R. H. BATH, LTD., Silver-Gilt Medals, both for Gladioli.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

SEPTEMBER 5-8.—The second annual show under the auspices of the Corporation of the City of Glasgow and the Glasgow and West of Scotland Horticultural Society was held in the Kelvin Hall, Glasgow, on these dates. This show has become one of great importance, and it is well worthy of the dignity of the second city of the Empire. It is satisfactory to know that in a great industrial city like Glasgow a flower show of such magnitude can be held so successfully. The entries numbered 3,456, being an increase over last year of more than 300, and at the close of the show on Saturday evening we were informed that the attendance of the public had been most gratifying to the promoters.

The quality of the competitive exhibits was of a very high order of merit, vegetables being especially fine. Fruit was not up to the high standard attained at last year's show, as the climatic conditions over Scotland generally have been of an adverse character, yet the results collectively were good. Sweet Peas were staged in grand condition, and several authorities on this flower who were present declared that the finest examples are seen at the Glasgow shows. The vases shown by Mr. JAMES PAUL, Killearn, were stated to be the finest seen this year at any of the leading exhibitions. Roses were not so fine as usual, but in all other classes the exhibits were of splendid quality. The sum of £1,500 was offered in prize money, and, in addition, there were many valuable cups and other trophies as well as medals. There were 381 classes in all. One of the most important was for a rock or rock and water garden, arranged on the floor level in a space of 30 feet by 15 feet, to be viewed from the front only. There were four prizes of £40, £30, £20, and £10 respectively. The first prize was easily won by Messrs. OLIVER AND HUNTER, Moniaive, Dumfriesshire, for an artistic and natural piece of rock and water work. The plants employed were in keeping with the high order of the design of the garden.

For a group of stove and greenhouse plants arranged for effect on the floor, and to occupy a circle 20 feet in diameter, similar prizes were offered as for the rock gardens. In addition the Corporation of the City of Glasgow Challenge Cup went to the winner of the first prize. This was secured by Mr. W. A. HOLMES, West End Nurseries, Chesterfield, for a highly decorative arrangement of foliage and flowering plants; the second prize was won by Mr. T. M. PEICH, Highfield Nursery, Great Horton, Bradford, and the third by W. COATS, Esq., Paisley (gr. Mr. Peter McQuarrie). For a group of Liliums, arranged on the floor to occupy a circle of 9 feet in diameter, Mr. T. M. PETCH excelled with finely grown specimens. Mr. A. T. HARRISON, Maybole, Ayrshire, was the leading winner in the class for six pots of perpetual-flowering Carnations. Mr. JAMES TEMPLETON was the principal winner in the classes for pot Palms. In the class for three stove or greenhouse plants, Mr. JOHN WELSH, Glasgow, was placed first, and Mr. JAMES TEMPLETON gained premier honours for three ornamental foliage plants. He was also first for three Dracaenas. W. COATS, Esq., Paisley (gr. Mr. P. McQuarrie) led in the classes for 12 varieties of plants suitable for table decoration, and he was also first in the class for Crotons. Sir JOHN REID, Ascot, Bute (gr. Mr. I. Davidson), was a prominent winner in the classes for pot plants. In all there were 44 classes in this section. Some very finely grown examples were shown in nearly every class by amateurs and gardeners.

There were twenty classes for Roses, the principal one for a collection of cut Roses, artistically arranged, to occupy a space of 15 feet by 6 feet. There were four entries. The first prize, which included the Eastwood Challenge Cup, was won by Mr. THOMAS ROBINSON, Porchester Nurseries, Nottingham. He staged a fine lot of beautifully coloured flowers. Messrs. B. MCGREDY AND SON, Portadown, were second; Messrs. ALLAN, Norwich, third

Digitized by Google

and Mr. E. J. HICKS, Twyford, fourth. Messrs. T. SMITH AND SONS, Stranraer, were winners in the class for six baskets of decorative Roses. In the class for 48 blooms, distinct varieties, Messrs. HUGH DICKSON, LTD., Belfast, were first, whilst Messrs. D. AND W. CROALL, Broughty Ferry, led in the class for 24 blooms. The other principal prizewinners in the Rose classes were Mr. LAWRENCE BLACK, Fife; Mr. JOHN PROSSER, Newton Mearns; and Mr. DONALD MURCHISON, Glasgow.

VISCOUNTESS COWDRAY, Dunecht, Aberdeenshire (gr. Mr. W. Smith), was the leading exhibitor in the class for a collection of Sweet Peas, artistically arranged to occupy a space of 15 feet by 6 feet. Mr. JAMES PAUL, Killearn, was an easy winner in the class for 24 vases of Sweet Peas, and Mr. JOHN SMELLIE, Helensburgh was first for 12 vases. These two exhibitors secured the majority of the prizes in the other classes for Sweet Peas.

In the other classes for cut flowers mention may be made of the exhibit of Mr. C. ENGELMANN, Saffron Walden, which secured first place in the class for a collection of perpetual-flowering Carnations. Messrs. TORRANCE AND HOPKINS, Busby, were first for a similar collection of Border Carnations. Early flowering Chrysanthemums were a particularly strong class; Messrs. TORRANCE AND HOPKINS led in the class for a collection. Other leading prizewinners were Mr. CLAUDE JENKINS, Glasgow; Mr. THOMAS NELSON, Rutherglen; and Mr. W. P. BLYTH, Busby.

In the section for cut herbaceous flowers the entries were numerous, and all of remarkably high quality. Dahlias were exceptionally fine. Mr. PETER BAUCHOPE, Alexandria; Mr. HUGH BONE, Girvan; and Mr. JOHN RICHARDSON, Polmont, were the principal winners for hardy herbaceous flowers. Mr. CLAUDE JENKINS, Glasgow, was a notable winner in the Dahlia classes. One of the finest classes in the show was that for twelve 10 inch vases, three spikes in each, of Gladioli. Messrs. GEO. MAIN AND SON, Prestwick, Ayrshire, were first for noble examples of this flower. They also led in the smaller class for six vases. There were many classes for Pentstemons, Antirrhinums, Phloxes, Asters, Stocks, Begonias, etc., and also for Pansies and Violas. Competition was particularly keen in the latter classes, and Mr. A. OLLAN, Campbelltown, was a leading prize-taker.

The decorative classes were an important feature of the show, there being 18 entries in the class for a decorated dinner table, 8 feet by 4 feet. The first prize was secured by Miss NELLIE GIBSON, Welbeck Abbey, Worksop, for a somewhat heavy arrangement of choice Orchids. The second place went to Mrs. LITHGOW, Langbank (gr. Mr. L. Davidson), for a display of Gloriosa and Lady Pirrie Roses. Third prize was won by Mrs. RUSSELL, Newton Mearns, for a delightful arrangement of single Roses. The varieties were Irish Elegance and Old Gold. R. J. DUNLOP, Esq., Barskimming, Mauchline (gr. Mr. J. Currie), was placed fourth, with a most graceful decoration of red Spiraeas and Asparagus. Mr. GEORGE REID, Dundee; Mr. W. PAULANE, Alexandria; and Miss MARGARET SMELLIE, Helensburgh, were other prominent winners in the decorative classes.

FRUIT.

For a decorative fruit table, the collection to consist of 24 dishes of fruit, in not fewer than nine distinct kinds, the premier prize and Challenge Cup was awarded to EARL BALFOUR, Whittingehame, East Lothian (gr. Mr. George Anderson), for a choice collection. The Grapes were Black Hamburgh, Cooper's Black, Muscat of Alexandria, Madresfield Court, and Appley Towers; Peaches, Apples, Pears, and Melons were also very fine. The decorations used were red Carnations and Gypsophila. The second prize was awarded to WALTER CURRIE, Esq., Castle Leran, Gourock (gr. Mr. C. Trail). The Grapes in the first collection received 85 points, and in the second 80½ points. Mr. D. CAMPBELL, Dumfries, excelled for a collection of 12 dishes of fruit, and Mr. FRANK G. DUNBAR won in the class for six dishes.

The classes for Grapes were keenly contested. For eight bunches Mr. S. GORDON, Whauphill, secured premier honours with finely finished bunches, and Mr. W. J. BUCHANAN, Alloa House Gardens, Alloa, led for four bunches. There were 70 classes in the fruit section.

VEGETABLES.

The vegetable classes at Glasgow are always keenly contested, and they are notable for the supreme excellence of the exhibits. For a collection in which a first prize of £10 was offered, leading place was taken by Mr. JOHN GRAY, an amateur gardener, Uddingston. The same exhibitor won, in keen competition, leading honours for the two next most important collections, including the Lord MacLay Challenge Cup. In the class for a collection open to amateurs only, first prize was won by Mr. JOSEPH DEVOY, Stranraer. There were over 80 classes for vegetables. The principal winners were Mr. J. DEVOY; Mr. ROBERT GRIGOR, Dumfries; Messrs. W. MURRAY AND SON, Polmont; and Mr. JAS. McGHEE, Houston.

NON-COMPETITIVE EXHIBITS.

Non-competitive exhibits were very numerous, and we only detail the leading and most important.

The largest exhibit in the show was staged by THE CORPORATION OF GLASGOW, per Mr. MATTHEWS, the Director of Parks and Gardens. This secured a Gold Medal and special appreciation. Large Gold Medals were awarded to Messrs. DOBBIE AND CO., LTD., Edinburgh, for Roses, Sweet Peas, and Dahlias; Messrs. AUSTIN AND MCASLAN, Glasgow, for vegetables; Messrs. KENT AND BRYDON, Darlington, for a rock garden; Mr. MAXWELL M. HART, Glasgow, for a rock garden; Messrs. CHARLESWORTH AND CO., Haywards Heath, for Orchids; and Messrs. L. R. RUSSELL, LTD., Richmond, Surrey, for flowering plants.

Gold Medals were awarded to Messrs. AUSTIN AND MCASLAN, for Conifers; Messrs. BLACKMORE AND LANGDON, Bath, for Begonias; CARSE OF GOWRIE NURSERY CO., Errol, for fruit; Messrs. STORRIE AND STORRIE, Glencarse, for fruit; Mr. H. N. ELLISON, West Bromwich, for Ferns; Messrs. KERR AND CO., Glasgow, for vegetables; Mr. WILLIAM LEIGHTON, Glasgow, for flowers; Mr. THOMAS SMITH, Newry, for shrubs; Messrs. SANDER AND SON, St. Albans, for Orchids; Messrs. THYNE AND SON, Dundee, for flowers.

Silver Medals were awarded to Messrs. BAKERS, Wolverhampton, for hardy herbaceous flowers; Messrs. DANIELS BROS., LTD., Norwich, for Black Currants; Messrs. JOHN FORBES, LTD., Hawick, for hardy herbaceous flowers; Messrs. I. HOUSE AND SON, Bristol, for Scabious; Messrs. LEARMONT, HUNTER AND KING, LTD., Dumfries, for fruit; Mr. D. MCLEOD, Manchester, for Orchids; Mr. W. WELLS, Junr., Merstham, for herbaceous flowers; and Mr. C. T. YOUNG, Glasgow, for Dahlias.

ROYAL OXFORDSHIRE HORTICULTURAL.

THE annual show of the above Society was held on the 29th and 30th ult. Rain fell almost incessantly on the first day; the second day, however, was fine, and there was a good number of visitors.

Mrs. G. H. MORRELL again displayed a non-competitive collection of choice plants from her famous gardens, and her gardener, Mr. A. Gibson, is to be congratulated on setting up such a graceful group. Mr. JOHN JOHNSON, of Garsington, staged an effective bank of hardy perennials.

Messrs. ALLWOOD BROS., Haywards Heath, had on view a splendid display of choice Carnations, a few of the best varieties being Wivelsfield Apricot, Benora, and Edward Allwood.

A beautiful exhibit of Roses was staged by Mr. GEORGE PRINCE, the most noticeable sorts being Padre, Mme. Butterfly, Emma Wright, Mrs. Oakley Fisher, and Hadley, the last being a very sweet scented variety. Another choice exhibit of Roses was staged by Mr. J. MATTOCK, of Headington.

Messrs. ISAAC HOUSE AND SON, Bristol, had an effective arrangement of perennial Scabious. Mr. JOHN WALKER, of Thame, exhibited a collection of Dahlias, the most notable sorts being President Wilson, Ebor and Sydney Jones.

Although the season in this locality has not been one of the best for vegetables, some good specimens were staged. Mrs. LESSING won the first prize in Messrs. Sutton and Sons' class. Mr. A. E. BRADSHAW took premier honours in Messrs. H. Smart and Sons' class, with superb produce, and his gardener, Mr. R. Wadham, is to be congratulated upon the fine exhibit. Mrs. LESSING was awarded the second, and Mr. W. JACOBS the third prize.

Messrs. WEST AND SON had on view a varied collection of garden sundries. Mr. HENRY DREW, Longworth, exhibited a choice collection of Roses. Messrs. BLACKMORE AND LANGDON showed a choice group of Phloxes, Delphinium and Begonia blooms.

The miscellaneous groups of plants were the best ever seen at this show. Mrs. LESSING, of Kingston House, won the first prize, Mr. T. H. ROSE the second, and Messrs. WEST AND SON the third.

Table decorations are another pleasing feature at this show. Mr. G. E. COUSINS was awarded first prize.

Fruit was fairly well shown. Black and white Grapes exhibited by Mr. A. S. B. TULL, were very fine in both bunch and berry.

Obituary.

William Douglas.—We deeply regret to announce the death of Mr. William Douglas, Easter Duddingston, Portobello, one of the most able and experienced market gardeners in Scotland. His land, of which he was proprietor, was notable for its fertility and the marvellous crops which it was capable of producing. The land was kept in perfect order, and Mr. Douglas was recognised as one of the best cultivators in the country. He grew his own strains of Cabbages, Leeks, Celery, Turnips, Beet, etc., and these were very carefully selected every esason. His grounds were regarded as a model of what a market garden should be. Mr. Douglas came in contact with a wide circle of seed merchants through Messrs. Dobbie and Co.'s annual Potato trials being carried out on land leased from him. He took a keen interest in these trials, and was always delighted to meet officials and trade visitors to them, who in their turn much appreciated his shrewd observations. The funeral took place on the 3rd inst., at Portobello cemetery, and was largely attended by a representative assembly of market gardeners, seedsmen, and others connected with agriculture and horticulture. Mr. Douglas had a serious operation two years ago from which he never recovered.

TRADE NOTE.

THE Ministry of Agriculture desires to inform growers and exporters of Potatos that following representations made to the Argentine Government as to the difficulty of procuring the entry of Potatos from this country into the Argentine Republic, revised regulations have now been issued by that Government which will allow the importation of selected Potatos grown in this country. These regulations provide that each consignment of Potatos imported into the Argentine must be accompanied by two certificates, one certifying that the land on which the Potatos were grown is satisfactory, and the other certifying that the Potatos have been inspected and found free from injurious diseases. The latter certificate must be issued at least

Digitized by Google

one month after the date of the certificate relating to the land.

The Ministry is prepared to arrange on application for the necessary inspections in the case of Potatos grown in England and Wales which are intended for export to the Argentine. In order to comply with the regulations, early application should be made to the Ministry so that an inspection may be carried out at the time of lifting the Potatos. A further examination immediately prior to shipping will also be necessary. A fee at the rate of £2 2s. per day, with a minimum of £1 1s. is payable for the services of an inspector.

ANSWERS TO CORRESPONDENTS.

CAT TAIL.—*G. P.* We cannot identify the weed by the name you give, but if you will send us a specimen we will endeavour to advise you as to the best means of eradicating the plant.

FAILURE WITH TREE SEEDS.—*J. R. C.* Seeds of Hawthorn, Holly and Yew should be gathered when ripe, mixed with damp sand or ashes, and buried in the ground until the following spring, taking care to protect them from mice. It will take two, or even three, years before all the seeds germinate. Seeds of Laurel, Hazel, Cherry and Plum should be mixed with dry sand, and stored in a cool, dry place until spring. These should all germinate the first year. Mice are the greatest enemies of all these seeds.

NAMES OF PLANTS: *T. H.* 1, Hoya carnosa: 2, Stephanotis floribunda.—*Japonica.* Ceanothus Gloire de Versailles.—*S. B.* Flowering shoot, Calycanthus floridus; fruiting shoot, Cydonia japonica.—*B. A.* 1, Lythrum Salicaria; 2 Sidalcea malvaeflora.—*H. M.* Probably Tiarella cordifolia.—*F. B.* Not recognised; send specimens to a Rose specialist.—*E. B.* Double-flowered Bramble.—*X. Y. Z* Momordica Charantia.

NIGHT SOIL.—*Angmering.* The material in your earth closets would have but little manurial value and the disinfectant you have employed might prove injurious to plants. If you have an out-of-the-way place in the garden where it could be placed in a heap and mixed with plenty of dry soil, the harmful effect of the disinfectant might disappear in time, and you could then spread it over the vegetable quarters in the autumn and dig it deeply in the soil.

SCUM ON LAKE: *A. H.* Bordeaux mixture sprayed on to the surface of the lake will destroy green scum, but the operation should be repeated after several weeks, if necessary Use the mixture at about half the usual strength to commence with, so that the aquatic plants may not be injured. The operation, if carried out carefully, will not harm the goldfish that are present in the water.

SOOT ON LAWNS: *F. J. B.* Soot is a nitrogenous fertiliser and would therefore encourage the growth of grasses, but at the same time it would encourage the growth of lawn weeds and to some extent of Clover also. We believe Achillea may be dyed by means of the aniline dyes, obtainable through most oil and colour merchants.

TOMATOS WITH HARD, YELLOW PATCHES: *H. E. M.* and *M. E. C.-B.* The hard, yellow base of your Tomatos is not due to organic disease. It is generally attributed to a lack of potash in the soil, and you will be well advised to use wood-ash freely in the potting compost for your Tomatos. You might try an application of soluble potash to your present crop, say sulphate of potash, and in order to render it soluble as quickly as possible you should place the sulphate of potash in boiling water and allow it to cool before applying it to the roots.

REMARKS.—The demand during the past week has been rather indifferent. Consignments of English Worcester Pearmain Apples have been heavy, and the necessity of clearing, as well as increased shipments from abroad, brought about lower values. At the moment of writing a better tendency is noticeable. Large green cooking Apples are much wanted, but medium-sized and small Apples are a slow trade. Pears are scarce and much in request. Grapes from all sources sell well. Melons are not going out very freely. Peaches of the best grades are a good trade, but others are difficult to clear. The Orange trade is fairly steady, but that for Lemons would improve with fine weather. Tomatos have not been plentiful, and prices quoted are much firmer. Cucumbers show little or no variation in price. The increased arrivals of field Mushrooms have not much affected the price of forced Mushrooms, except in the case of broilers.

REMARKS.—Flowering plants consist mostly of Chrysanthemums in 48 sized pots. These meet with a ready demand, and the supplies are not sufficient for present requirements. A few Asters are obtainable, but their prices are high. There is a fairly good supply of Ferns of various sizes, and a good selection. Palms are less plentiful. A few good plants of Crotons are on offer. Kochias are also good in 48 sized pots. A few plants of Cinerarias are the newest subjects on sale. Trade in general is quiet.

Violas, per doz bun.	1 6–	2 0

REMARKS.—General conditions were more favourable for the week-end trade. Chrysanthemums are arriving in larger quantities, disbudded blooms being most plentiful and much improved in quality; good blooms of yellow, pink, and bronze sorts are now on sale. Amongst "spray" Chrysanthemums white is still short, bronze being the best on the market at the present time, yellow and pink being rather poor in quality, but there should be a further improvement during the next few days, with a gradual fall in prices. Carnations are of very medium quality, but Roses show a general improvement in quality. Gladioli are somewhat shorter, and already show signs of finishing. Similar remarks apply to Statices and Gypsophila. The quantities of good Asters are below present requirements, and their prices remain firm. Michaelmas Daisies are now making their first appearance, the variety King George (dark blue) being good in quality. Physalis is now at its best condition, and prices are more normal. Choice white blooms include Gardenias, Lapagerias, Lily-of-the-Valley, Stephanotis, and a little white Bouvardia. Small consignments of Arums (Richardias) are now arriving.

GARDENING APPOINTMENTS.

Mr. Cyril Harding, late General Secretary of The British Gardeners' Association, has been appointed British and Colonial representative for the firm of J. P. HARTMANN, Ghent.

Mr. W. G. Sims, for the past four and a half years Gardener-Bailiff to Col. ASHLEY, M.P., The Grove, Stanmore, Middlesex, and previously to joining the army Gardener for six years to Sir HENRY HOARE, Bart., Stourhead, Zeals, Wiltshire, as Gardener-Bailiff to Sir ARTHUR WHINNEY, Lee Place, Charlbury, Oxon. (Thanks for 2/6 for R.G.O.F. Box.—EDS.)

Mr. James Elson, for the past ten years (including three and a half years with H.M. Forces) Foreman at Lowther Castle, Penrith, Cumberland, and previously at Petworth Park, Sussex, and Stanford Hall, Loughborough, Leicestershire, as Gardener to Captain M. P. JONES, Llannerch Park, St. Asaph, North Wales. (Thanks for 2/6 for R.G.O.F. Box.—EDS.)

Mr. William M'Guffog, recently Gardener to C. E. GALBRAITH, Esq., The Barony, Dumfriesshire, and formerly Gardener to the late COUNTESS OF SELKIRK, Balmae, Kirkcudbright, as Gardener to Mrs. KENWICK, Mabie, Kirkcudbrightshire.

Mr. John Melrose, recently gardener to E. W. HOPE-JOHNSTONE, Esq., Rachills, Lockerbie, Dumfries-shire, and formerly gardener to SIR CHARLES HOPE-DUNBAR, St. Mary's Isle, Kirkcudbright, as gardener to E. PERRINS, Esq., Ardross Castle, Ross-shire.

CATALOGUES RECEIVED.

GEORGE BUNYARD AND CO., LTD., Maidstone.—Roses.

F. G. WOODCOCK, Drum Hill, Walmer, Kent.—Sweet Peas.

H. H. MAW AND SON, Friarwood Nurseries, Pontefract.—Greenhouse, Hardy and Bedding Plants.

Bulbs.

CLIBRANS, LTD., Altrincham.

D. G. PURDIE, 6, Waterloo Street, Glasgow.

SAMUEL FINNEY AND CO., LTD., 20, Grainger Street, Newcastle-on-Tyne.

Apple Canker.

The influence of climate on the distribution and extent of plant diseases is well illustrated in the case of canker—the disease of Apples due to the fungus Nectria galligena. As is the case with Phytophthora infestans, the fungus responsible for late blight in Potatos, the canker fungus flourishes and does most damage in wet districts and seasons. This disease is more prevalent in the west than in the east of England—the rainfall map giving, indeed, a fair indication of its intensity—and it is yet more general in Ireland where the weather is wetter even than in the West of England. Direct experiment made some years ago confirms these facts. Pot trees of Apples (Allington Pippin and Lord Suffield) affected with the canker fungus and overwatered took the disease more readily and suffered from it more severely than did plants of these varieties grown in pots under drier conditions. Experiments designed to ascertain whether spraying is a means of preventing infection have been carried out during the past few years at Long Ashton*. The results, as perhaps might have been expected, are by no means conclusive. In a previous report the result of spraying with Burgundy mixture was not unencouraging. Equal numbers of branches of Apple which had previously been inoculated with the fungus were sprayed and unsprayed. Subsequent examination showed that in the case of the unsprayed branches there were five hundred canker infections, whereas in the sprayed there were only one hundred and seventy-nine. In the following year, 1920, a hundred branches were selected, twenty on each of five trees; all were inoculated with the canker fungus and half were sprayed. The number of infections which appeared in 1921 was but small in either case, but it is somewhat disconcerting to find that the balance favoured the unsprayed branches. The investigation, however, showed incidentally the great importance of adequate surgical treatment for canker. Cankers imperfectly cut out tended to reappear, and hence the advice is given that when cutting out cankered branches the operator should take care to cut right back to clean wood. Having regard to the climatic influence on canker, it would seem that it would pay the grower well to exercise great care in the choice of a site and to secure well drained land for his orchard. In the case of established orchards he should endeavour, in wet districts, to improve drainage by all means in his power, and probably also, in the case of heavy land, to use surface rooting stocks. The number of sprays which mycologists and entomologists are apt to recommend for the numerous pests of the orchard is becoming too great for the orchardist's purse and patience. Indeed, it is not surprising to find that some fruit growers are beginning to abandon spraying altogether. For our part, we confess to surprise that this should be so, but neither we nor anyone else can say whether or not they are right. What is wanted very much is an experimental orchard where trees are planted under reasonably favourable conditions, so that the economic side of spraying might be investigated. There are, in fact, two distinct problems which ought to be investigated, and investigated separately. One of these problems is: Given a good average climate and suitable soil, careful and thorough cultivation and a proper choice of varieties, is spraying profitable or not? The other question is: What spray routine is best calculated to keep down the common pests in orchards which are not situated in places most congenial to fruit production? In the latter case, we think that a composite spray of lead arsenate, lime sulphur and a little nicotine is calculated to go far toward keeping orchards clean. Needless to say, in a year such as this, it would have failed, and in our experience did fail to check aphis on Plum. Exceptional seasons, no doubt, will demand exceptional remedies, but for our part we doubt whether any spray would have controlled this year's attack of aphis unless it had been done just at the moment when the pests were making their appearance.

* "Canker Control Trials," by S. P. Wiltshire. *Annual Report*, Agricultural and Horticultural Research Station, Long Ashton, Bristol, 1921.

Presentation to Mr. T. Pateman.—On the occasion of Mr. T. Pateman leaving the gardens at The Node, Knebworth, in the district of Welwyn, to take charge of Sir Charles Nall-Cain's garden and estate at Brocket Hall, Hatfield, members of Knebworth Parish Church presented him on Monday last with a beautiful inlaid mahogany clock inscribed as follows: "Presented by subscription in 1923 to Thomas Pateman. In grateful recognition of his voluntary services as a member of the choir and bell-ringer for thirty-seven years." The presentation was made by the Countess of Lytton, who said Mr. Pateman would be missed both by the members of the church and by horticulturists, but they had the satisfaction of knowing that he had not removed far from their midst and they hoped to see him frequently with them in the future.

The Future of the Island of Lewis.—In connection with Lord Leverhulme's decision, in view of the failure of his scheme to develop on industrial lines the Island of Lewis, which he purchased for that purpose, to make it over to the inhabitants, a meeting of the local authorities concerned was held at Stornoway on September 3, when Viscount Leverhulme made known to them his decision. Among other observations, Lord Leverhulme said he would be grateful if the trustees would turn part of the grounds round Stornoway Castle into a public park, named the "Lady Lever Park," after his late wife, who was with him in 1884 when he made his first visit to the island.

Box Hill Preservation.—The Editor of *Country Life* writes that he has "very great pleasure and satisfaction in announcing the success of the Box Hill Fund. The solicitors for the National Trust have instructions to draw up the deeds of purchase. It is impossible to give the exact figures because subscriptions are still coming in and some of the lists are not yet closed, but at present a total of about £7,500 has been subscribed. It is hoped to raise this sum by another £1,000, as the upkeep of a large estate, such as the Box Hill property has now become, involves a considerable expense. For this happy outcome of the movement thanks are due in the first place to those members of the general public, who, in spite of the difficulties of the time, have generously subscribed according to their means, and particular thanks must be accorded to 'G. H. O.,' the anonymous donor who started the fund with a subscription of £1,000, and, according to his promise, has closed it with an equal sum. In the next place acknowledgment is cordially made to our Press contemporaries, who have generously given both space and trouble to the furtherance of the cause. Among these, particular thanks are due to the efforts of *The Gardeners' Chronicle*."

Forcing by Means of Hot-water Springs.—France, poor in coal but rich in water power, is seriously studying the question of the electrification of her railways, and in a paper read at the Academy of Sciences, M. Dybowski raised the question whether her numerous hot mineral springs might not be utilised for forcing vegetable products. An experiment has been made, he pointed out, in the South of France, where such springs abound. At Prechacq (Landes), water at 63 deg. (145 deg. Fahr.) was obtained by boring, and conveyed in covered conduits to a twenty-five acre plot more than a mile away. Here greenhouses were constructed, each an acre in extent, for forcing fruit and vegetables Speaking, of course, from a purely scientific standpoint, M. Dybowski did not give commercial figures, but he pointed out that in principle springs must have a minimum temperature of 60 deg. C. (140 deg. Fahr.), with an ample supply, to be of practical service. Wooden conduits best retained the heat, but a loss of at least 2 deg. Fahr. per mile was inevitable. Basing his calculations on a loss of 25 deg. C. (75 deg. Fahr.), he calculated that a spring giving ten gallons per minute (at 140 deg. Fahr.) gave calorific results equal to burning a ton of coal, and concluded that where hot springs abound and markets are available, the experiment might be extended with good results.

New Potato Awarded a Gold Medal.—Lord Derby's Gold Medal offered in the Ormskirk Potato trials for the finest new variety immune to Wart Disease has been awarded to Messrs. Sutton and Sons' new late variety, Ben Cruachan, a very prolific, white, round Potato of excellent quality.

Imperial Fruit Show.—Further particulars of this important fruit show, which will be held in the Belle Vue Gardens, Manchester, on October 26 to November 3, are sent by the secretary. Practically all space allotted for trade exhibits at the exhibition has now been taken. A silver cup, valued at £50, presented by George Swift, Esq., J.P., will be awarded to the best trade exhibit in the show. Several special features have been and are being arranged. The Federation of British Growers have taken a large stand, and are arranging for part of it to be used for Apple tasting. Different varieties of Apples will be cut into slices and placed on plates or other suitable receptacles, clearly marked with the name of

Digitized by Google

the variety. Visitors to the show will be at liberty to taste samples of the varieties offered free of charge. An Apple packing competition has been arranged to be run concurrently with the Apple packing demonstration. There are two classes—one for boys and girls of 18 years of age and under and one for those over 18 years of age. Prizes of £3, £2, and £1 will be awarded in each class. Other special features are still in course of organisation, including a table dressing competition for Manchester hotels (fruit and flowers only to be used), a guessing competition of the number and weight of Apples in various commercial packages, open to all visitors. The National Federation of Fruit and Potato Trades Association is again undertaking the organisation of a special cooling demonstration, showing the various ways of cooling fruit and Potatos. Special trains for the fruit growing districts are being arranged. The Wisbech Fruit Growers' Association is proposing to run a one-day excursion from Cambridge, picking up the Wisbech growers at March.

it were insufficient, in the light of present knowledge, and indicated some of the more suitable lines of attack. Professor Quanjer, of the Dutch Institute for Plant Pathology, said that in these "virus" diseases the attack was usually general in the whole tissues, whereas in most diseases due to fungi, bacteria, eelworms, or insects the seat of trouble was localised. It was probable that the virus was spread through the phloem system. This hypothesis had been confirmed by various kinds of experimental evidence, including the grafting of phloem tissue from diseased to healthy plants. The carriers of infection were almost certainly aphides sucking the phloem in some Potato diseases and similar diseases of other plants. The curly top of Beet was spread by leaf-hoppers. In Tobacco and Cucumber mosaic disease, where infection could easily be spread by means of the juice, biting insects acted as carriers. There was much evidence that diseases of the "virus" group, in the case of Potatos, spread more in warm climates and

various mildew plants on Peas, Beans, Peaches, Vines, Onions, and attributed to the fungi, strengthens this opinion with all the force which can be derived from popular belief in the history of common phenomena. To this Mr. Berkeley adds much evidence derived from microscopical observation and other careful scientific research. His papers on these subjects in our own columns and in the *Journal of the Horticultural Society*, demand the most attentive consideration. A passage in the latter work (Vol. 1, p. 23) may be taken as an exposition of the views entertained by this distinguished naturalist. "The decay" (in the Potato), writes Mr. Berkeley, "is the consequence of the presence of the mould, and not the mould of decay. It is not the habit of the allied species to prey on decayed or decaying matter, but to produce decay—a fact which is of the first importance. Though so many other species have this habit, these have not. The plant then becomes unhealthy in consequence of the presence of the mould, which feeds upon its juices and prevents the elabora-

MEMBERS OF THE HORTICULTURAL EDUCATION ASSOCIATION AT WISLEY GARDENS, ON THE 14TH INST.

Virus Diseases in Plants.—At the meeting of the British Association on the 18th inst. in a joint discussion held by the Botanical and Agricultural Sections, it was stated that the so-called virus diseases of plants caused great devastation. Mr. T. Whitehead said that leaf-roll, crinkle, and stipple-streak were probably the most serious of the Potato virus diseases in this country. Leaf-roll alone had resulted in losses of 55 and 51 per cent. of the crops in 1921 and 1922 respectively. Leaf-roll did not appear to lessen the size of the tubers, but it diminished their numbers by one-half. The effect on the yield was not seen in the year of attack, but only in the crop from infected tubers. The selection of healthy plants, elimination of "rogues," and early lifting appeared to be the simplest practical ameliorative measures. Dr. Paul Murphy said that recent researches were tending to show that several of these obscure maladies, classed as "virus diseases," and hitherto set down to old age, or unfavourable environmental or cultural conditions, were really infectious diseases, to be compared with some of the most serious infections of men and animals. He dealt in particular with "curl" of Potatos, indicated that the old measures of combating sheltered localities, which also were more favourable to the aphides and green-fly generally.

Horticultural Education Association. — The eighteenth annual meeting and conference of this Association was held on the 13th and 14th inst. On the second day the members visited the Royal Horticultural Society's Gardens at Wisley, where they were received by the director, Mr. F. J. Chittenden, V.M.H., and under his guidance inspected the trial grounds, etc. The photograph shows the members assembled at the entrance to the laboratory, in which they were entertained to luncheon. After luncheon, the controller of horticulture, Mr. W. G. Lobjoit, O.B.E., who is seen in the centre of the group, delivered an address.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Fungi the cause of disease.* The Rev. Mr. Berkeley, than whom there is no higher living authority, advocates the opinion that fungi are the cause of disease, and assigns the injury produced of late years in the Potato to their attacks. The notorious mischief connected with the presence in Corn of smut (Uredo segetum) and the foetid Bunt (Uredo caries), of

tion of nutritive sap in the leaves, while it obstructs the admission of air and the emission of perspiration. The stem is thus overcharged with moisture, and eventually rots, while every source of nutriment is cut off from the half-ripe tubers. It would be as reasonable to say, with our knowledge of the nature and habits of the cereal fungi, that bunt, or mildew, or the other allied diseases which affect Corn, are the consequence and not the causes of disease. In favourable seasons they are not developed; in unfavourable seasons they spread like wildfire; in one sense, therefore, the atmospheric conditions are the cause, but merely as they stimulate into action the latent pest. The immediate cause of disease is the fungus which preys upon the tissues of the Corn." *Gard. Chron., September* 16, 1848.

Appointments for the Ensuing Week.—Wednesday, September 26: Mitcham, Tooting and District Horticultural Society's meeting. Thursday, September 27: Royal Botanic Society's meeting; Wargrave and District Gardeners' Society's meeting. Friday, September 28: Carluke Chrysanthemum Society's show. Saturday, September 29: Finchley Chrysanthemum Society's show.

THE ROSE GARDEN.

ROSE MME. COLETTE MARTINET.

It is not often that a new Rose of distinct merit fails to catch the public eye. If it does so, then it is likely to be of Continental rather than of British origin. Rose Mme. Colette Martinet was raised at Lyons and was introduced by M. Pernet-Ducher in 1915. Any new variety sent out by him naturally deserves attention, and this variety was at first in demand, but seems quickly to have gone out of favour. I wonder why. In the National Rose Society's *Select List of Roses*, 1917 edition,* Mme. Colette Martinet occurs in the section devoted to some recent Roses, and is there described as a fine new H.T. Rose, copper coloured, vigorous and suitable for garden, bedding or pot. It does not appear at all in the Society's 1921 edition. Then I have before me a nurseryman's catalogue of four years ago, in which this variety is mentioned as "a new Rose that has undoubtedly come to stay." Yet two years later it had dropped out of his list!

From my experience of this Rose I am inclined to compare it for general use with that well-known variety, Mme. Ravary, a creation also of M. Pernet-Ducher. The two Roses are not identical, but as representing the yellow bedding hybrid Tea, the one may be weighed against the other, and taking all points into consideration I think Mme. C. Martinet outweighs Mme. Ravary. In these days of Pernetiana yellow Roses, the origin of which we owe also to the great French hybridist, the yellow H.T. may appear to some *de trop*. But the two types are quite distinct. The H.T's may be spoken of as coppery yellows, while the Pernetianas give us clear and definite yellows, approaching to that of the Daffodil. There is, of course, at present a great run on the Pernetiana yellows, especially since the weakly Rayon d'Or has been succeeded by such good growers as Mrs. Wemyss Quin, Golden Emblem and Christine. But the coppery yellows have a charm of their own. They have a fuller and sweeter perfume, and blend better, I think, with the red H.T.'s.

Now let us see how Mme. Colette Martinet compares with Mme. Ravary as an all-round garden Rose. The bloom of Mme. Ravary in its half-open state and when exhibiting its best colour is exquisite and not equalled by that of the other Rose. But in the expanded state Mme. Martinet is to be preferred; it is fuller, more pointed, keeps its colour better and lasts twice as long in a vase. Mme. Ravary has, however, a stouter petal. Both are equally fragrant and both stand the rain quite well. They have strong flower stems, but that of Mme. Martinet is the stiffer of the two. A conspicuous fault of yellow H.T. Roses is the lack of colour in their late blooms. Mme. Ravary is a great offender in this respect. Its autumn flowers are apt to lose all their charm of colour and to appear only of a dirty white. Mme. C. Martinet is distinctly less disappointing in this respect. As regards constitution there is little to choose. Mme. Martinet is somewhat taller in growth—an advantage—as Ravary is at times rather too dwarf. I have a suspicion that Mme. Martinet may be more sensitive to frost. Both appear equally resistant to mildew. Mme. Ravary has perhaps a slightly larger and thicker leaf.

Consequently from my experience Mme. Colette Martinet would seem worthy of further trial, especially in the north-west of England. Of course, if Mme. Ravary and the like are considered to have been ousted by the Pernetiana yellows, then Mme. Martinet must be reckoned a back number as well: but I think there is room in the Rose garden for both kinds of yellows, and I fancy in the cooler parts of Britain the yellow H.T's will give more bloom during the season than the Pernetianas.

It would be interesting to know how the yellow H.T. Mrs. Frank Bray compares with the above two Roses. I have had no experience of this variety. It was formerly included in the N.R.S.'s *Select List of Roses*. *J. P., Carlisle.*

* This edition is unfortunately not dated, but I find on reference to the *Rose Annual* that it must have been published in 1917.

POT ROSES.

Roses in pots that have been stood out-of-doors all the summer should now be attended to. If they are in good condition all that is necessary is to turn them out of their pots to see that the drainage is perfect, remove some of the top soil and substitute a top-dressing consisting of a fairly heavy loam enriched with the addition of a six-inch potful of bone meal to every bushel of soil and sufficient coarse sand to render the compost porous. Plants in a bad condition at the roots will, of course, require to be repotted, using a similar compost to that advised for top-dressing. For their sizes Roses require fairly large pots, as they need a large root run; climbing varieties in pots require the same treatment, staking and tying them securely. The pots should then be plunged to the rims in a bed of coal ashes in an open position out-of-doors until such time as they are required for forcing. The best of the dwarf polyantha Roses are excellent for pot cultivation, as they flower profusely over a long period. Young plants that were flowered in 48-sized pots last season should be shifted into six or seven-inch pots, in which they will make fine specimens. The stock may easily be kept at a sufficient number by inserting a batch of cuttings each year, lining them in out-of-doors towards the end of October. Cuttings of this nature inserted last year have made good plants and are ready for lifting and placing in 48-sized pots during the latter half of October. Potted at that time they become well established at the roots and are ready for use during the following spring. Some of the best varieties for this purpose are Coral Cluster, Orleans (see Fig. 62), Red Orleans, Mrs. Cutbush, Edith Cavell, and E. Thornton. This class of Rose is very useful for conservatory and house decoration, and should be grown largely in private establishments for the purpose. *C.*

FIG. 62.—DWARF POLYANTHA ROSE ORLEANS AS A POT SPECIMEN.

HARDY FLOWER BORDER.

ANEMONE RANUNCULOIDES.

This pretty little Wood Anemone is a native of some districts of Great Britain, although not at all common. It has pleasing leaves and small, golden yellow flowers, rather smaller than those of A. nemorosa, our native white Wood Anemone. For planting in a moist and rather shady part of the garden, in soil of loam and leaf-mould, with or without the addition of a little sand, it is excellent. Still prettier is a paler coloured variety, as yet scarce, named A. ranunculoides pallida or sulfurea, which, when it has spread into a little mass, is very attractive indeed. There is a rare old variety with double, golden yellow flowers, called A. ranunculoides fl. pl. It is rarely offered in catalogues, but is an interesting and pretty flower, which I have grown satisfactorily under the partial shade of a deciduous tree. Roots of these Anemones may be purchased in autumn and should be planted as soon as possible about an inch deep. A. ranunculoides and its varieties are quite hardy. *S. Arnott.*

AN EFFECTIVE BORDER.

A most effective border I recently saw consisted of a planting of various orange, terra-cotta and crimson flowers, with no particular design in its formation, but evidently only for colour effect. The plants used were clumps of Tritoma uvaria grandiflora planted five feet apart, with large clumps of Montbretia crocosmaeflora George Davidson just a little in front, a belting of orange and terra-cotta Antirrhinums, and an edging of Viola Maggie Mott. The plants had as a background a dark green Holly hedge. The effect of the border under a setting sun was indeed dazzling. *W. Logan.*

The Week's Work.

THE FLOWER GARDEN.

By C. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Evergreen Shrubs.—Between now and the end of October is a good period in which to remove evergreen shrubs or make new plantings of the same, the ground being still warm, while the atmospheric conditions are gradually cooling, and, generally, increasing in humidity. On the assumption that the shrubs may occupy the position for a long time, the site should be dug deeply, and any materials thought necessary incorporated at the same time. In making a new shrubbery the practice is sometimes followed of planting more closely than should be adopted to obtain an early "clothed" effect. The method has its value, and where it finds acceptance the best positions should be given to those plants it is wished to make permanent, while the supernumeraries might well be of a less valuable character and such as may be removed easily when signs of crowding are apparent.

Laurus nobilis.—In planting evergreens, a specimen or two of the Sweet Bay might be included, if the soil is drained and the site protected from the coldest winds by other shrubs. Usually one finds the Bay planted in or near to the kitchen garden, for the reason, presumably, that a few leaves are occasionally required for culinary purposes. These could, however, be gathered just as well from trees in the pleasure ground, while the latter place would be enriched by the inclusion of the fragrant foliage.

Violas and Pinks.—Where the dividing of the old roots of such plants as Violas and Pinks is contemplated, the plants will recover more quickly if the work is done now, while the soil still retains much of its summer warmth, and small, young shoots have a few rootlets. Separated thus early, such plants have a great advantage over those divided in spring. The soil for the Violas should be moderately rich, and if on the heavy side, lightened by the free addition of leaf-mould. Rooted cuttings of both these plants may be inserted where they are to bloom next year, but should there be any doubt about the well-being of the Violas in winter, let them remain where they are until the spring.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

The Early Peach House.—This house is generally utilised for storing tender plants from out-of-doors until the time comes to make preparations for starting the trees. The foliage, when nearly matured, may be detached by lightly brushing the shoots in an upward direction with a new Birch broom. Any trees that require attention at the roots should receive such attention before all the leaves have dropped, as the formation of new roots takes place quickly when a certain amount of foliage still remains. If the tree is in an unhealthy state owing to an unsuitable rooting medium, it may be given a fresh lease of life by carefully lifting and preserving the roots, and renewing the border with good loam of a medium character, to which is added sufficient old mortar rubble, broken plaster, wood ashes or burnt refuse to ensure perfect drainage. Peaches and Nectarines require plenty of water when in active growth, and a free passage of moisture through the soil is essential or the latter may become sour, more particularly if liquid manure from the farmyard is used in watering. When replacing the tree, lay out the roots at different levels up to within six inches of the surface, and not deeper than eighteen inches. Any thong-like roots should be notched at intervals, inserting a small stone or piece of other hard material to keep the cut open. Bunches of fibrous roots will eventually form at the notched parts, to the material benefit of the tree. The soil should be made quite firm and watered thoroughly, this completing the operation.

Root-pruning and Planting.—Trees with a tendency to grossness may be root pruned. Lift the tree, notch the strong roots, which are generally bare of fibrous roots, and replant them, using a little fresh soil where it is not necessary to entirely renew the border. If it is necessary to bring in a tree from out-of-doors, do so at the earliest opportunity after the foliage begins to fall; in the case of a large tree every care should be taken to preserve the roots in good condition, and any damaged ones should be cut back with a sharp knife to a sound part. When the work of planting is finished, give the roots a good soaking with water to thoroughly moisten the soil, and syringe the tree frequently to keep the foliage fresh. Shade should be afforded the tree if the weather is bright and sunny.

Pruning the Trees and Cleansing the House.—If the house is not immediately required for plant storage, as soon as the leaves are removed the trees may be pruned, the glass and woodwork cleansed, and the walls limewashed. If insect pests have been troublesome, dress the trees with paraffin emulsion, and in bad cases a second application may be necessary. For slight attacks, hot water applied at a temperature of 150° will be a suitable remedy. After the trees have been trained the surface soil should be removed from the border, disturbing the roots as little as possible, substituting good turfy loam mixed with a sprinkling of old mortar rubble and wood ash. Old-established trees may be dressed on the bared surface with a suitable artificial manure and covered with fresh soil. The house should be ventilated freely for some weeks to come.

THE KITCHEN GARDEN.

By R. W. THATCHER, Gardener to MARK FIRTH, Esq., Carlton Park, Market Harborough, Leicestershire.

Beetroot.—The roots of the first and second crops of Beets should by now be up and stored under the same conditions as advised for Carrots; but the main crop, if the roots are not quite matured, may be left in the ground till October: in no case should they be allowed to become large and coarse.

Cauliflower.—Carefully examine all Cauliflower plants that are "turning in," and cover the curds with the foliage to preserve the colour. If the heads are maturing too fast, pull the plants up with as much soil attached to the roots as possible, and heel them in under a north wall, where they will keep fresh for a considerable time. Make a sowing of two or three varieties in a cold frame in which the seedlings will withstand the winter, and when large enough prick them out fairly closely together, and keep the soil stirred between them. The rooting medium should not be too rich, otherwise the plants will grow too large. These, if wintered carefully, and kept as hardy as possible, will make fine plants for putting out in March, and will produce far finer heads than those sown in January or February. Magnum, Purity and Walcheren are three good varieties for this purpose.

Carrots.—The main crop of Carrots may now be lifted, and the tops cut off about 2 inches from the roots. Handle them carefully, or they will not keep well; they are best stored outside, provided heavy rains can be kept from them and the position is not too damp. Failing this, store them in sand in an open shed, leaving the tops just showing. Young carrots growing in frames should be thinned slightly and the frames kept close to favour quick growth. See that the plants do not suffer for want of water: one is apt to think watering is not necessary when much rain is falling outside, as is usual in the late autumn.

HARDY FRUIT GARDEN.

By A. J. HARTLESS, Gardener to Major J. F. HARRISON, King's Walden Bury, Hitchin, Hertfordshire.

Labelling.—Now is a suitable time to label fruit trees, as, just before the removal of the crop, the form of the fruits enables many sorts to be identified. Labelling, apart from other uses, is of great educational value, not only to the younger men learning their profession, but to visitors in a garden. If it is necessary to use staples as a means of attachment to large trunks, they should be examined periodically, in order to see that the bark does not grow over them. When of convenient height copper wire should be used for attaching labels loosely to a branch. There does not yet seem to be a light, weather-resisting label obtainable at a moderate price; a label upon which the name will stand out clearly, yet will be economical by allowing the old name to be rubbed off, as in the case of the "Ivorine" label," for repeated use, is greatly needed. Acid writing on zinc labels often becomes difficult to decipher. On established trees the lead inset label is the most permanent type that can be used. It will now be a good opportunity to note trees consistently unfruitful, or for some reason or other need replacing by better varieties. Such can be removed at the first opportunity, and fresh soil added, or the soil entirely changed and allowed to settle before the new trees are ready for planting.

Preparations for Planting.—It is a commendable practice to start lifting trees soon after the crop is gathered provided the trees have been well watered a few days previously. With the fall of the leaves transplanted trees make good root-hold before the ground gets chilled. Materials that may be required, such as broken bricks for drainage and lime-rubble for mixing with the soil, should be got in readiness for planting operations.

General Remarks.—Young stock raised by budding some time since should be regularly examined, and the ground kept free from weeds. Soft fleshed Apples, such as Ecklinville Seedling, may need protection from birds. If they are very troublesome it is an advantage to gather early Apples a little under ripe, as they finish off quickly on trays. There are indications that next season's Apple crop will be a good one. Continue to make a vigorous attack on all weeds before heavy rains set in. Nothing looks worse in a garden than large areas of fruit plantations covered with weeds all the winter. Strawberry plants should now be making good progress. Those that appear sickly may be attacked by eelworm, and should be destroyed by burning.

PLANTS UNDER GLASS.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Azaleas.—Plants of the indicum section of Azaleas that have been stood out-of-doors during the summer—although they do not take any harm from a few degrees of frost—should now be placed indoors, a perfectly cool, unheated house being best for this purpose. When housed they may be kept at rest until such time as they are required for forcing, for which purpose the earlier-flowering varieties should be selected. As such plants were started early last season, their growth naturally was completed early; they are also, for this reason, in better condition for early forcing. The small red obtusum variety, sometimes known as calyciflora, is very useful for this purpose, as it may easily be had in flower at Christmas.

Coleus.—Cuttings of Coleus should now be rooted, as young plants winter much better and occupy only a little space in the houses. A few stock pots afford a ready means of increase early in the New Year. This advice also applies to many other soft-wooded stove and greenhouse plants that are used for summer decorative work.

Hydrangeas.—Early-rooted batches of Hydrangeas in 48-sized pots should be stood in cold frames, where they should be exposed freely to

Digitized by Google

the weather, except during times of frost, which might damage the flower buds. Plants rooted early in the New Year are now flowering, thus extending the season of this useful plant.

Oxalis floribunda.—Of the many species of Oxalis, O. floribunda is one of the most useful for conservatory and greenhouse decoration. Plants that have been dried off should now be turned out of their pots, and the largest roots selected for repotting, 6-inch pots being a suitable-sized receptacle. The Oxalis also makes a splendid basket plant, and the white variety is equally useful and beautiful for this purpose. The plant will grow well in any good potting compost. In common with many South African plants of this class, O. floribunda grows quite well in a cold frame from which frost can be excluded, and may remain in the frames until it comes into flower.

THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

Epiphronitis Veitchii.—Like many other hybrid Orchids with parents greatly differing in habit, this Epiphronitis is not one of the best growers with many, whilst with others it makes fine specimens and produces large heads of its bright scarlet flowers. When seen in this condition it is a most delightful plant, and worthy of all the care and attention necessary to produce it at its best. The present is a very suitable time to attend to any potting or propagating that is necessary to maintain or increase the stock. Constant propagation is the only means of keeping a healthy stock of rare and difficult Orchids, and young plants have much more vigour than older ones. This plant is constantly producing aerial side shoots from the old stems, and by the continued making up of young plants from this source, and the division of the older plants a good stock may soon be obtained. In dividing the old plants, it should always be remembered that the old, rootless stems should be removed. Many attempt to grow this Orchid in too much warmth, yet it is one of those plants which delight in an even temperature the whole year round. It should be grown in the warmer end of the cool house during the summer, and the cooler end of the intermediate house during the winter. At no season should this Orchid be subjected to a dry treatment, but at all seasons afforded a fairly moist and humid position, and be syringed freely on all favourable occasions. It is best grown in small, well drained pots, and stood on a damp surface, where, generally, the overhead syringings will be sufficient to keep it in a healthy and growing condition. The plants should be examined from time to time to see that none is suffering for the want of water, as if allowed to become dry they will soon be infested with thrips and other insect pests. The compost should consist of peat, A1 fibre, and Sphagnum moss in equal parts; the potting should be done rather firmly.

Epidendrum.—Members of the scandent section of Epidendrum are very effective, lasting in flower for a long period. Although the flower heads on some plants may still be good, it is advisable to thoroughly overhaul the plants each year to maintain young healthy stock. It is desirable from time to time to cut back some of the strong growths that have produced flowers, to within six inches of the base. The best results are attained by not allowing any aerial growths to develop, encouraging those only which come from the base. When the aerial growths are kept removed, the basal growths develop more freely, and it is from these that the best heads of flowers are obtained. These Orchids are not very particular as regards compost, and will succeed in any open, fibrous material, placed in pots according to the size of the plants. They should be grown in a light position in the Cattleya house, where they may be syringed freely overhead. They may also be planted out against walls, where they often do remarkably well, and produce good material for use as cut blooms.

ORCHID NOTES AND GLEANINGS.

LAELIO-CATTLEYA MORVYTH.

A GRAND inflorescence of three blooms, each measuring eight inches across the petals, of Laelio-Cattleya Morvyth, is sent by Mr. H. G. Alexander, Orchid grower to Lt.-Col. Sir Geo. L. Holford, K.C.V.O., Westonbirt. It results from a cross between Messrs. McBean's variety of L.-C. St. Gothard (C. Hardyana × L.-C. Gottoiana), and the Westonbirt L.-C. Lustre (C. Luddemanniana × L.-C. callistoglossa), which has been such a good agent in the raising of other beautiful hybrids.

The sepals and petals are light rosy-mauve, the silver-white ground showing at the bases of the segments and in a delicate veining on the petals.

Cattleya Luddemanniana sets the form of the lip, which has a tubular base expanding in front to a broad, crimped lobe of ruby-purple colour, the medium area being tinged with orange and the base striped with yellow on a reddish-purple ground. The side lobes of the lip are blush-white in the interior and light mauve on the outside.

STENOGLOTTIS LONGIFOLIA.

AT the meeting of the Royal Horticultural Society on the 4th inst., Messrs. Stuart Low and Co. showed several specimens of this pretty member of the Natal Ophrydeae, which experience has proved that everyone with a greenhouse can grow and flower successfully, the flowers lasting in succession about three months. S. longifolia bears narrow leaves with undulate margins and produces its flower spikes freely, each about one foot high and furnished on the upper part with pretty mauve flowers. The plant may be increased by division. The only other species in cultivation is S. fimbriata, which is of smaller stature, but equal in beauty, its flower spikes being produced from rosette-like crowns, the leaves having bands and spotting of dark purple. *J. O'B.*

LOUDON'S SECOND TOUR TO SCOTLAND.

LOUDON made three journeys through England and part of Scotland. It is to the second that these notes refer as being of the greatest interest on account of the detailed notes left by himself, supplemented by those of his newly wedded wife. They left Bayswater together on April 24, 1831, and returned in September, being called back from Paisley to attend the sick bed of his mother, who survived only six weeks longer. Loudon gives a graphic account of many gardens, but those form only a part of the matters of which he took notice, the whole furnishing a most interesting survey of the economic conditions prevailing at that time. The first stage, if it may be so called, was to Manchester, but he remained six weeks at Birmingham, during which time he laid out the Botanic Gardens at Edgbaston. The rest of the time was occupied in viewing gardens and nurseries *en route* and travelling the intermediate distances. More than one hundred private gardens and nurseries come under purview, the better known being Stowe, Moorpark, Warwick Castle, Coombe Abbey, Enville, Hagley, Leasomes, reminiscent of Shenstone, Trentham, Haddon Hall and Chatsworth. He notes a severe frost on May 7 which destroyed blossom and young shoots of shrubs, Ash trees and Coniferae also suffering severely; Potatos were cut to the ground. In 1819 there was a frost almost as destructive. He remarks of Stowe that the garden was, owing to reduction of hands, very badly kept, and that at Warwick Castle in even worse condition. The greenhouses there were covered at this time with opaque roofs. Of Trentham it is stated that forced and wall fruits were fine, and good order was evident in the management. Alton Towers had been rebuilt in 1811 and ever since hundreds of workmen had been employed on the grounds. The Earl of Shrewsbury, who had died a few years previously, was his own landscape gardener. As a result the whole place was "one of the most singular anomalies to be met with in England." It was kept in perfect order, a staff of women being employed continually picking up or gathering leaves, removing withered flowers, etc. They were on certain occasions clothed in Swiss garments, adding thereby to the picturesqueness of the scene. Loudon characteristically remarks that the farmer and gardener Lunn "is the only Protestant gardener we ever heard of who turned Catholic." Chatsworth is described as an unsatisfactory place. Loudon disliked a herbaceous border that was edged with grass cut vandyke-wise. Nor was he pleased with the heating of new glass structures which Paxton effected by means of flues. But one thing did receive his entire approbation—that house, grounds and gardens were open free to the public every day. Of the gardens visited most were being worked with a reduced number of men; though this applied to the larger estates rather than to places of small extent. At Chatsworth there were 24 men to 12 acres. The parsonage garden of Offchurch, Bury, for instance, was "eminently beautiful," and it was doubly interesting on account of the incumbent being the Rev. Matthew Wise, a descendant of Wise, the nurseryman, of Brompton Park. Horace Walpole, in a letter, mentions meeting Wise himself when a very old man; his son was a clergyman, and the above-named may have been a great grandson. Of the many nurseries he inspected, that of Cullis, Leamington, contained the best indoor plants; Pope, Handsworth, the best collection of herbaceous plants; and Lowe, Wolverhampton, good forest trees and shrubs, besides being the best kept nursery "between Edinburgh and London." Mist, a market gardener near Birmingham, who trenched to a depth of four feet, was celebrated for Strawberries and Asparagus, while the "best hothouse builder in Britain" was Mr. Jones, of the same city. The superintendent of Manchester Botanic Garden informed Loudon that he had lived when a journeyman gardener "in the wretched stoke-holes of the Comte de Vaude's garden at Bayswater, and read there in the winter evenings by the light of a furnace door." There are other instances of a similar kind given, such as that of young men having to sit up half the night to attend to flue-heated structures. But it was not uncommon in my young days to have to sit up to 1 a.m. to stoke boilers during frosts in January. At Wombourne our traveller found Potatos being forced by the spontaneous combustion of coal in old coal mines underneath. He was greatly astonished at the backward condition of agriculture in this stage of his journey. His remarks, indeed, thereanent are almost incredible. The next stage of the journey was via Chester and Liverpool to Dumfries, leaving Manchester on July 1, and inspecting on the route about 100 gardens, nurseries, etc., nurseries being much more numerous in the north of England than in the south. Some of the more noteworthy places visited were Vale Royal, Eaton Hall, Croxteth Park, Knowsley, Lathom, Levens Hall, Netherby and the residences of the poets Wordsworth and Southey, as also the villa occupied by "Christopher North" of the *Noctes Ambrosianae*.

Eaton is stated to have been very ill-kept, Grass and Clover growing on the lawns for hay production, and the shrubberies overrun with weeds. The indoor fruit at Knowsley was equal in quality to that grown at Trentham, and at Tatton Park it was equally fine, the gardens there being kept in first-rate order. At Levens, Loudon found the gardens as they had existed since the time they had been laid out in the reign of James I., the famous clipt Yews being of a later date than that of Loudon's visit. It is pleasant to know that Rydal Mount, the residence of Wordsworth, was kept in perfect order. Nothing is said of his neighbour's (Professor Wilson), but we know from other sources that he was proud of his garden. The only nurseries he saw worth commending were those respectively of Messrs. F. and J. Dickson, Chester, and Mr. Skirving, Walton, near Liverpool, "two most complete nurseries." It was at Chester that Mr. Loudon first saw Paxton's *Horticultural Register*, which with other cheap publications reduced the £750 income then produced from the *Gardeners' Magazine*, to almost nothing at the death of its proprietor. The travellers on entering Scotland by way of Langholm would have been stranded owing to a fair had not a proprietor in the vicinity taken them into his house. Later they stayed at Closeburn, Jardine Hall, Munches, and other country seats in Dumfriesshire, and at Ayr and Kilmarnock Mr. Loudon was invited to public dinners given in his honour. In nurseries at Ayr he found many rare plants "reckoned rare and valuable in the London nurseries." And in one "many very rare" herbaceous plants. At this period Coniferae were a glut and were either being burned or sold at the low price of 6d. per 1,000. Of the general up-keep of gardens it is stated that Grass on lawns was badly kept, but kitchen gardens were kept "with more care and neatness than they are in England." Not a single weed could be found in them. On the other hand, wall trees were generally ill-cropped if at all.

Concerning particular residences Loudon was greatly impressed by the grandeur of Drumlanrig, formerly called Queensberry House. It was here, as Gilpin relates, that in hewing terraces out of the whin-stone rock a workman could carry away in his apron the result of his labour during the day. At St. Mary's Isle our author found abundant crops of Grapes and Peaches, the vine border not having been stirred for 28 years. Of the other residences mentioned nothing worthy of notice occurs, probably on account of his hurried departure for home. But it is to be gathered that gardens in the west of Scotland were sadly deficient in labour, and gardeners were as a whole considerably harassed in making ends meet. Their cottages, too, were very deficient in comfort, some of these being of only two apartments, and, of course, those of the working men were even worse. He especially mentions those on the estate of Logan which were "built of turf, or mud, or stones or of a mixture of all three," reminding one of Burns's "auld clay biggin'." Wages were as low as 5s. the week. The long account of this journey, of which the above gives only a few extracts, abounds with information regarding a great variety of subjects, and propositions for the betterment of the less fortunate classes of the community, which are only now in many cases being put into practice. *R. P. Brotherston.*

A GARDEN OF EVERGREEN SHRUBS AT MALONYA, CZECHOSLOVAKIA.

THE new Czechoslovak republic can boast of two famous gardens of which no counterpart is to be found anywhere else in Central Europe, viz., the park of Count Ernst Silva Tarouca at Pruhonice, near Prague, and the evergreen gardens of Count Istvan Ambrózy-Migazzi, at Malonya, district of Nyitra, Slovakia. Before the war Malonya belonged to Hungary, and Count Ambrózy is a well-known Hungarian. Of both parks there seems to be very little, if anything, known in England. Having had the good fortune to be well acquainted with both gentlemen, I wish to draw the attention of readers of *The Gardeners' Chronicle* to those two gardens. In the present note I shall deal with Malonya.

More than 30 years ago Count Istvan Ambrózy became interested in the use of evergreens suitable to be planted in the open. He started with Prunus Laurocerasus schipkaensis, the Cherry-laurel from the Balkans, that has proved hardy in almost every part of Central Europe, and is next to the large-leaved Rhododendron the best evergreen, broad-leaved shrub for Continental parks and gardens. In the *Yearbook* of the German Dendrological Society, of 1921, Count Ambrózy gives a vivid account of his experiences at Malonya. It is by no means a favoured place for gardening. The soil is very poor; the endemic trees are Quercus Cerris and Q. sessiliflora, with a scanty undergrowth. The climate is rather hot in the summer, while the temperature falls as low as 22.5° Celsius in a normal winter. Nevertheless, Count Ambrózy succeeded in creating a paradise of evergreens and half-evergreens, consisting of between 600 and 700 forms of broad-leaved trees and shrubs and Conifers. As he states in an important contribution to the illustrated handbook, *Unsere Freiland-Laubgehölze*, edited by Count Silva Tarouca and myself, of which a short account was given in *Gard. Chron.*, p. 127, he tried to match the English gardens, and to prove that many broad-leaved evergreens are perfectly hardy on the Continent when planted and cared for in the right way. It is a great pity that Malonya is such an out-of-the-way place, otherwise no traveller interested in outdoor gardening should go from Prague or Vienna to Budapest without stopping at Nové Zamky and paying a visit to Malonya, near Vieska Tekovska, on the railway line to Topolcianky.

When driving from the very small station to the castle upon the hill nobody would think of the possibility of finding there such a thing as a park for the most part formed out of evergreens. But as soon as the visitor comes near to the house a large terrace appears surrounded by a broad, deep green hedge of Cherry-laurel growing luxuriantly in the full sun. At the entrance to the castle, tall, tree-like bushes of Schipka Laurel, Japanese Euonymus, Ilex Aquifolium, Elaeagnus pungens, Phillyrea decora, Prunus lusitanica, Aucuba, and other well-known evergreens, surprise him by their healthy growth. The walls are covered with Pyracantha coccinea, P. crenata, varieties of Euonymus radicans, Rosa Banksiae and other climbers with conspicuous

Digitized by Google

flowers or fruits. Deciduous shrubs are, of course, used too, as for instance Jasminum nudiflorum and J. primulinum, several Loniceras, Bignonia radicans, Forsythias and others. At almost every time of the year there are flowering or fruiting shrubs in the immediate vicinity of the castle. The number of hardy herbaceous perennials, including bulbs, is countless. I can only mention the most noticeable of the broad-leaved woody plants, and must omit reference to Conifers.

Of broad-leaved evergreens next to the Cherry Laurels many forms of Ilex Aquifolium constitute the undergrowth of the main parts of the park. Besides large groups of Mahonias (Mahonia Aquifolium, M. repens and their hybrids as well as M. Bealei, wrongly known as M. japonica), there are such evergreen Barberries as Berberis Julianae, B. Hookeri, B. Gagnepainii, B. acuminata and other Chinese species. There are also Cistus laurifolius, different evergreen Cotoneasters (C. Franchetii, C. Henryi, C. pannosa, etc.), Daphne Laureola, Daphniphyllum, half-evergreen Ligustrums, Mahoberberis Neubertii and its variety ilicifolia, Osmanthus Aquifolium and its varieties, Quercus hispanica and its varieties known as Q. fulhamensis and Q. Lucombeana, Q. Ambrozyana, a hybrid Oak between Q. Cerris and Q. suber, Phillyrea glabra, Rhamnus Alaternus, Ruscus aculeatus, R. hypoglossum, several species of Sarcococca, Skimmias, Stranvaesia Davidiana and its var. undulata, Umbellularia californica, some evergreen Vacciniums, and last, but not least, the beautiful Chinese Viburnums, such as V. rhytidophyllum, V. Davidii and V. utile.

The grounds are covered with all forms of Vinca major, and especially V. minor. Besides, there is to be seen in broad patches Pachysandra terminalis, as well as P. procumbens, two excellent evergreens for almost every soil and situation. Lonicera pileata, too, is well adapted to cover the ground, but is likely to be cut down by severe frost. It should be planted on a slightly elevated position on account of its marvellously coloured blue fruits, which, unfortunately, are too much hidden under the leaves. Lonicera nitida looks so much like a Myrtle that it is frequently used on the Continent to replace Myrtus communis, which was introduced in great quantities from Italy before the war. Berberis buxifolia nana, Bruckenthalia, Bryanthus, Calluna, several Ericas, Dryas, Iberis semperflorens, Loiseleuria, Pachystima, and Polygala Chamaebuxus form dense mats, and are grown wherever there is a suitable place. One of the finest plants to make a deep green covering is Cotoneaster Dammeri, of which the lucid, red berries remain untouched by frost and birds until the spring. Gaultheria Shallon is thriving well, even in rather poor soil.

The different species and forms of Hedera are, of course, to be seen in a most luxuriant state. They climb to the tops of trees, and cover the ground as well as walls or rocks. Besides the Cherry Laurels and the countless forms of Ilex Aquifolium, we find large thickets of Phillyrea decora, usually known as P. Vilmoriniana, and of the loosely branched, large-leaved Photinia glabra. The bluish-white undersides of the fine leaves of Daphniphyllum macropodum contrast well with the dark green of the surrounding plants. Other good evergreens of a height of more than one metre are Berberis Julianae, probably the best evergreen species of the genus from Central China which has been introduced by Wilson; Berberis acuminata, B. Gagnepainii, Cotoneaster Henryi, C. salicifolia floccosa, and Ulmus parvifolia. Of smaller evergreens, Cistus laurifolius does remarkably well. The dark hue of its leaves strikes a distinct note in the landscape. Viburnum utile is an excellent spring-flowering shrub with very odoriferous flowers. There are other species, too, of this valuable genus of flowers which have a most agreeable scent, including Viburnum Carlesii.

In several places in this park different species of hardy Bamboos play a great part in the forming of characteristic scenes. Like almost all the evergreens, they need good nourishment; Arundinaria nitida and Phyllostachys aurea may be cited among the best.

In a very sheltered place, protected by hedge-like plantings of Thuyas and other Conifers, a great surprise awaits the visitor: a group of healthy Camellia japonica, flowering every spring. The shrubs are up to three metres tall; they are the only ones I have ever met with unprotected in the open air in Central Europe. In the skilful planting and very careful cultivation of such plants that hitherto have been regarded as useful for greenhouses only Count Istvan Ambrózy has shown his genius. With the aid of his excellent head gardener, Misak, his difficult tasks have been accomplished with often surprising success.

In the English climate, of course, it is easy to create such an evergreen garden. But in Central Europe nobody, so far as I am aware, has ever made the attempt to use evergreens upon such a large scale and under such unfavourable conditions of soil and climate. Unfortunately, the war put an end to Count Ambrózy's great work. He had to leave his beloved Malonya, and is now living on a small estate in Western Hungary. Mr. Misak, his head gardener, has the park in his keeping, and, as I had the opportunity of observing on my several visits to Malonya within the last two years, everything is done to preserve, so far as possible, the main features of this unique garden. However, as the plantations become older, they will need careful thinning, and no park of this kind will ever prosper without the guiding hand of the master who created it. Malonya is one of the few memorable works of landscape gardening on modern lines. It would be a great loss, not only to Czecho-Slovakia, but to landscape architecture, if Malonya should fall into decay. *Camillo Schneider, Charlottenburg, Germany.*

NOTES ON SOME OF THE NEWER DAFFODILS.

HAVING been asked to write a few notes on the newer Daffodils, I have taken out my pocket-book, hunted up the annual report of the Midland Daffodil Society, and set about my somewhat difficult task. The chief difficulty lies in the fact that one's notes taken at R.H.S. and other meetings are generally very sketchy, owing to want of time; at least, mine are. There is so much to do, to see and to talk about at these meetings that the day is soon gone, and one has to make off to St. Pancras for the 123-mile journey home. The following is the list compiled. I have no doubt some good things have been missed, but that is inevitable. Even a Joseph Jacob or a Guy L. Wilson will sometimes miss good things, dazed, no doubt, by the wealth of fine flowers spread before their admiring gaze.

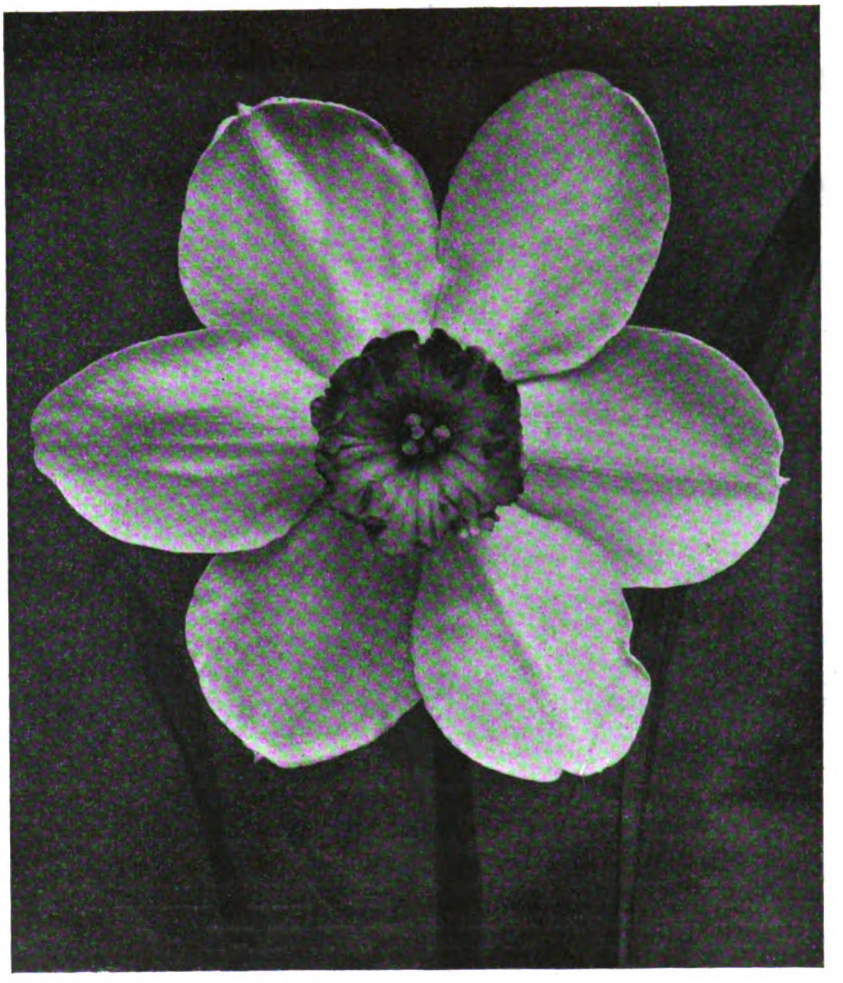

FIG. 64.—NARCISSUS JESSIE.

WHITE DAME.—A really white trumpet Daffodil. A beautiful flower, and only eclipsed by Beersheba, which it much resembles. Raised by Mr. Guy L. Wilson. A.M., R.H.S.

GOLDEN PEDESTAL.—A giant Incomparabilis variety of perfect form, uniform bright rich yellow, very flat and smooth perianth. A.M., R.H.S. Shown by J. L. Richardson, Waterford.

HONEY BOY.—A distinct yellow trumpet variety, uniform deep lemon yellow, medium-sized flower, smooth perianth. Raised by Mr. Guy L. Wilson. A.M., Mid. Daff. Soc.

EVEREST.—A very perfectly formed white trumpet variety. Shown by Donard Nursery Co. A.M., R.H.S.

MAGNOLIA.—A large Giant Leedsii, of good form, segments slightly pointed. I think it is one of Mr. Engleheart's productions. Exhibited by Mr. G. Monro.

Digitized by Google

ROBERT BERKLEY.—Another very fine white trumpet variety, a beautifully formed flower, with perfect poise. A.M., R.H.S. Shown by Mrs. Berkley.

VENETIA (5a).—A lovely photo of this very pretty triandrus hybrid is reproduced in the report of the Midland Daffodil Society for 1923. Exhibited by Mr. W. B. Cranfield. I fancy it has had an A.M., R.H.S., but am not sure.

FIRETAIL (3b).—This is one of the very finest of red-eyed Narcissi that has ever been raised. It has been a long time coming into its own, but has now had every award open to a new variety, getting the coveted F.C.C. when exhibited by Mr. Chapman and others last year. It is a very late variety, with a very long stem; flower large and flat, segments creamy white, eye nearly flat and deep crimson throughout. Raised by Mr. Crosfield.

SILVER SALVER.—An exquisite little Leedsii variety of the Moonbeam type; flat, well rounded white perianth, with flat eye of flower of perfect form, eye large, with deep edging of crimson. One of the very best. A.M., R.H.S. Shown by Messrs. J. R. Pearson and Sons.

DINTON RED EYE.—Again one of Mr. Engleheart's productions, and may be shortly described as a much improved Horace. A.M., R.H.S.

WIDE WING.—A Poeticus variety with great, broad segments of almost leathery substance, a very fine late Poeticus. A.M., R.H.S. Exhibited by Rev. G. H. Engleheart.

HELEN O'HARA.—A very fine pale bi-color Daffodil, with a long stalk. A.M., R.H.S. Exhibited by Mr. Richardson, Waterford.

DAINTY MAID.—A small, neat and very pretty flat-eyed Leedsii variety. A.M., R.H.S. Shown by the Welsh Bulb Farms.

BEERSHEBA.—I think there is no doubt that this is the finest of the many white trumpet Daffodils in existence. It is much larger than any of the old favourites, holds its head up well, is really white, and has a long stalk.

FIG. 65.—BED OF FICUS PLANTS OVER A GROUND OF ANTHERICUM LILIASTRUM, INTERSPERSED WITH IRESINES, IN BATTERSEA PARK (SEE P. 175).

palest lemon yellow. Exhibited by Mr. Chapman. A.M., R.H.S.

GREAT DANE.—A large trumpet Daffodil of Emperor colouring; a large, well-formed flower. Shown by Messrs. Barr and Sons. A.M., R.H.S.

GOLDEN EMPRESS.—A moderately large trumpet Daffodil, perfect in form and a uniform bright clear yellow. A.M., R.H.S. Shown by Messrs. Barr and Sons.

FORTUNE.—This is perhaps the most sensational Daffodil which has appeared for many years. It is a Giant Incomparabilis, of faultless form and poise. The perfectly flat perianth is pale yellow. The large Sir Watkin-like cup is orange red. The flower stalks are from 21 to 27 inches long, and the plant is very robust and very early flowering. Received a preliminary award at the hands of the R.H.S. Daffodil Committee. Exhibited by Mr. Chapman.

BEAUTY OF RADNOR (2b).—This (Fig. 63) is very like Bernardini in outline, but the cup is of a wonderful ochreous pink colouring. Quite distinct, and a great favourite of mine. Exhibited by Dr. Lower, of Presteign. A.M., R.H.S.

RED RIM.—One of Mr. Engleheart's choicest Poet's Narcissi; might be described as an improved John Masefield. A.M., R.H.S.

JOHN MASEFIELD.—Another of Mr. Engleheart's Poeticus varieties. A well rounded Raised by Rev. G. H. Engleheart. Preliminary award, R.H.S. Exhibited by Messrs. J. R. Pearson and Sons.

OPERA (4a).—This is a very dainty and attractive flower, and very close to a Poeticus. The perianth is pure white and well formed, the greeny-yellow eye has a Poeticus edging of bright red. A.M., Mid. Daff. Soc. Shown by Mr. W. B. Cranfield.

BRIMSTONE.—A large trumpet Daffodil of unique colouring. The flower is a uniform deep citron yellow. I thought it the most distinct trumpet variety exhibited at Birmingham in 1923. Preliminary award. Exhibited by Mr. W. B. Cranfield.

TENEDOS.—I think this is the finest and most distinct of all the Giant Leedsii sorts, and this is saying much, for the class is very well represented. The flower is very large, of fine form, well balanced and of good pose. The white segments are broad and overlapping, but pointed at the tips, giving the flower a star-like appearance. When well established the plant gives a great crop of bloom on very tall stems. The bulbs are of large size, and increase freely. When fully out the whole flower is white. A.M., Mid. Daff. Soc. Exhibited by Mr. Guy L. Wilson.

MOIRA O'NEILL.—A most beautiful pale bi-color trumpet variety, of largest size, but without a trace of coarseness. The plant is extremely vigorous, having leaves broader than those of Emperor; very long in the stalk. Raised by Rev. G. H. Engleheart.

JESSIE (3b).—A very lovely flower (Fig. 64). Well formed white perianth, 5 inches across; cup well expanded, yellow, with curiously variegated red edge. The flower seems to me a much improved Challenger, and a beautiful portrait of it is to be seen in the *Report* of the Midland Daffodil Society for 1923. Raised and shown by Mr. J. Mallender.

GRAND OPERA.—This is quoted as a Poeticus in Mid. Daff. Soc. report, but I think it is not a pure Poeticus; however, Poeticus or whatever it may be, it is a very remarkable flower. The flower is large, over 3½ inches across the perianth, which is pure white and well formed; the Poeticus-like eye is coloured deep red. Raised and shown by Mr. Herbert Chapman.

PURITAN MAIDEN.—This is one of my own raising, so I must not sing its praises too loudly. It is a 4a of Trumpet proportions. A medium-sized flower, with pure white perianth; cup (or trumpet) cream on opening, passing to white. The charm of the flower lies in its perfect balance and pose, and wax-like appearance. A.M., R.H.S.

LADY PRIMROSE.—A very fine pale bicolor trumpet; segments very broad and flat, creamy white; trumpet slightly bell-mouthed, soft, full Primrose. Fine for either garden or exhibition. Raised by Rev. G. H. Engleheart. Well shown by the Donard Nursery Co.

MARSHLIGHT.—A much improved Lucifer; the cup is very deeply stained with red. It is a much better grower than Lucifer, with abundant dark green foliage.

SCARLET QUEEN (2b).—One of the late Mrs. R. O. Backhouse's good things. The wide perianth is creamy white, while the flattish cup is of the brightest orange-scarlet.

SUNSET GLOW.—Another of the same class by the same raiser. Perianth pale yellow, cup wide, shallow, and of a distinct shade of bright orange.

ZILLAH (2b).—Yet another form from the same source, and a very attractive flower; segments broad and imbricated, creamy white; cup large and rather spreading, yellow, deeply edged bright orange-scarlet. A good strong plant.

MRS. LOWER.—A pure white trumpet Daffodil, with a tinge of green. A very lovely flower. Raised and exhibited by Dr. Lower, of Presteign.

In conclusion, I would say that this seems to be a season for large bulbs. A two-year bulb (or clump of bulbs) of Moira O'Neill weighed 1 lb. ¾ oz., while some of the Poeticus bulbs lifted here have been so large that one could hardly believe them to be true Poeticus. *J. Duncan, Pearson Lowdham, Nottinghamshire.*

TREES AND SHRUBS.

MAGNOLIA STELLATA.

ALL the members of this family are fine, handsome subjects and the species under notice is no exception. It does not grow so tall as some, only reaching a height of four to six feet. It has small, waxy white flowers, and has the advantage of being very free flowering, which cannot be said of some other varieties. The tree flowers in March and April; the blooms are about four inches across and star-shaped. It forms a dense bush and the foliage is a beautiful light green. The flowers are sometimes marred by early spring frosts, but in an open season it is an object of great beauty. A bed of this Magnolia planted in a sheltered position is a fine sight when the trees are in full bloom, and the flowers are sweetly scented. This Magnolia is much used for pot cultivation; it is one of the best of shrubs for the front row of the shrubbery and should not be omitted when forming a new plantation of mixed shrubs. *R. V. Thatcher, Carlton Park Gardens, Market Harborough.*

PUBLIC PARKS AND GARDENS.

BATTERSEA PARK.

THE public parks of London, which are celebrated the world over for their extent and beauty, fall into two main groups—those known as the Royal parks, belonging to the Crown, and the municipal parks of the London County Council. Hyde Park occupies the chief place amongst the Royal parks, and Battersea takes pride of position amongst those belonging to the municipal authority. The latter is the largest park in the South of London, and has an area of nearly two hundred acres. The whole of the south-western side is bounded by the Thames, and adjacent to the river is one of the finest waterside promenades in London, forming a broad roadway over half a mile long by the Embankment lined with beautiful trees. When the park was formed, the land was a swampy waste; how valuable an asset public parks and gardens become in time is well exemplified in this large London public garden, for the site nowadays would realise an immense sum of money as building land. The park was laid out by John Gibson, and it was he who designed the two most famous features of the park from a gardening point of view, namely, the famous sub-tropical garden and the section known as the Peninsula and Wilderness. The greater part of the area of the park is utilised for sports, and there are playing-grounds for cricket, tennis, bowling, netball, football, and other outdoor games, as well as a cinder track for racing and lakes and ponds for boating. In common with the other London parks, the one at Battersea suffered much damage during the war through its occupation by the military, and also by neglect owing to lack of labour, but on visiting it now one would never imagine that any interruption in its normal upkeep had taken place. The renewal of turf and reconstruction generally has thrown an immense amount of work on the staff, under the able direction of Mr. Frank Wright, the superintendent, who, it is interesting to record, started work in these gardens as a young man and has passed on through successive posts until he has come to occupy the proud position of superintendent of the chief of the L.C.C. parks and open spaces.

A very large open area where the turf was destroyed by the military has been converted into a new cricket ground. The fine sward presents a perfectly level surface, and exemplifies how well a lawn or playing-ground may be raised from grass seed, provided it is allowed a reasonable time to become established.

The trees and shrubs in this immense park constitute one of its chief features, and there are places in it where the visitor would imagine himself to be miles from any large town, whereas Battersea and the district are amongst the most densely populated areas of London. Some of the beautiful sylvan character of this park may be seen in the photograph reproduced in Fig. 66, especially when looking above and beyond the belt of shrubs at the base of the tall Elms.

There is a very fine avenue in the centre of the park planted with Plane trees; each tree is a model in shape, and the whole avenue has an imposing appearance. In the centre of this avenue is the bandstand, the ground around which is very prettily laid out. The Planes in the avenue were substituted for Elms, which, owing to their age and dangerous habit of shedding large branches, were undesirable where large numbers of the public congregate.

Our special purpose in visiting the park was to inspect the sub-tropical gardens; most readers are aware that the sub-tropical gardens at Battersea Park have long been regarded as amongst the finest of their kind in any public garden in the country, for John Gibson was a master hand at his craft, and he in turn was succeeded by superintendents as capable. His immediate successor was Mr. Rogers, who maintained the flower garden, including the sub-tropical garden, in the height of perfection, and he in turn was followed by other capable men, including Mr. Copper, Mr. J. Rogers, and lastly Mr. Frank Wright, who took charge in 1921.

In order to supply the large quantity of material used for bedding and to house the many plants of a tender nature employed in the sub-tropical garden, a considerable amount of glass has been erected in a secluded spot near the main or west gate. There are large glasshouses for the housing of Palms, Dracaenas, and the like used for plunging in the lawns and in the beds and borders, and smaller houses for the propagation of bedding plants. This part of the park is a great attraction in the Chrysanthemum season, when one of the largest houses is filled with Chrysanthemums and thrown open to the public. Already the propagation of such things as Pelargoniums, Fuchsias, Heliotropes, etc., had been commenced at the time of our visit in late August, and the large number of frames and glasshouses filled with these plants afforded some little idea of the immense number used for the ornamentation of the flower beds and borders in summer.

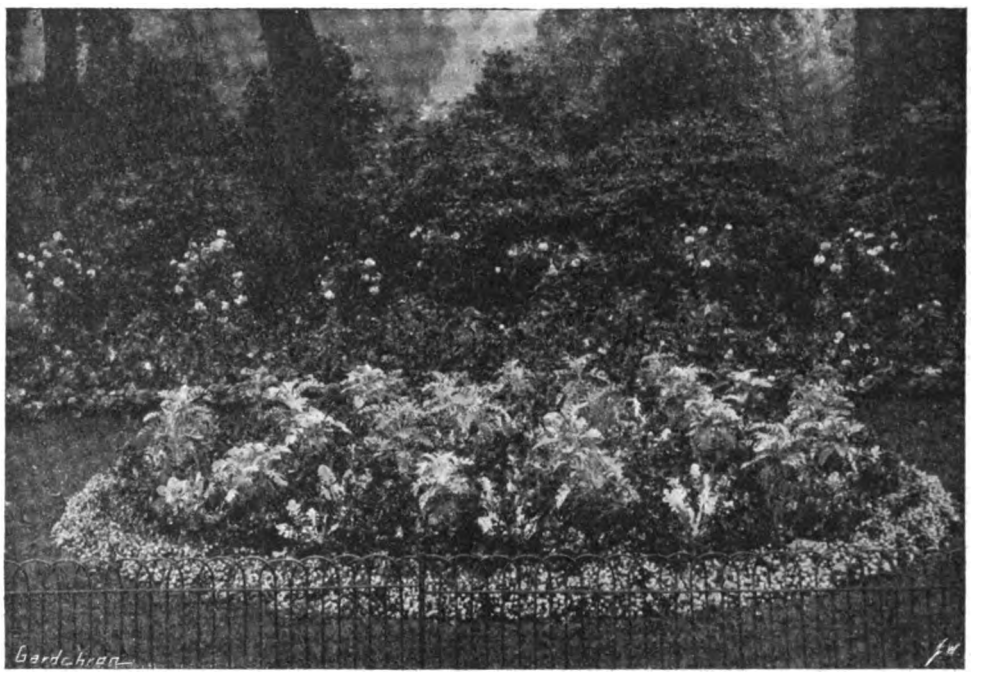

FIG. 66.—BED OF BEGONIAS INTERSPERSED WITH TALL PLANTS OF CINERARIA MARITIMA, AND EDGED WITH BLUE LOBELIA AND WHITE ALYSSUM, IN BATTERSEA PARK.

There is a very pretty border near the main entrance, furnished with standards of Coleus Sunray, with dwarfer plants of a golden-leaved Coleus interplanted with Abutilons in variety, Artemisia, Centaurea candidissima, and Albizzia lophantha. Near this part of the park is the famous old English garden, in which the visitor may imagine himself in the garden of a beautiful country estate. The centre of attraction is a Lily pool and water fountain, and in the pool are growing big clumps of Nymphaeas. Arranged all around, in the old English style, is a series of beds planted with such old favourites as Roses, Petunias, Fuchsias, and Violas, whilst some are entirely devoted to hardy herbaceous plants. The paths in this garden lead through pergolas and arches furnished with Roses, species of Vitis, Polygonum Baldschuanicum, and other climbing plants. So popular is this little enclosed garden, that the authorities have decided to enlarge it by throwing into it the part known as the botanic garden, where material is drawn upon for use in the teaching of botany, etc.

The principal flower beds are to be found in the sub-tropical garden, where fewer plants of a sub-tropical nature have been utilised this year than usual, for the weather was so unfavourable to the removal of tender Palms, etc., out-of-doors in the spring that Mr. Wright decided to wait no longer for fine weather, but completed the beds with a general variety of bedding subjects. Some of the most successful of the beds are those planted with Coleus. One circular bed, which is very effective, has red Coleus massed with standards of C. Verschaffeltii interspersed, but the best is the one with Coleus in panels of various colours with the dark variety Verschaffeltii in the centre and as an edging. Other beds are planted as follows:—The bed illustrated in Fig. 65 is furnished with tall plants of Ficus over a ground of Anthericum Liliastrum, amongst which are placed here and there plants of a red-leaved Iresine. The handsome-leaved plants in the background are Ailanthus glandulosus, and the variegated shrubs beneath them, Acer Negundo. The bed shown in Fig. 66 has a ground of Begonia semperflorens, freely interspersed with tall plants of Cineraria maritima, and edged with blue Lobelia bordered with white Alyssum. In the shrubbery border may be seen tall standards of New Salmon Ivy-leaved Pelargonium, above dwarfer plants of the older Mme. Crousse variety.

Other interesting beds in this part of the park are planted as follow:—Standard Pelargoniums with Veronica Andersonii variegata and Marguerites; Coleus with Lady Plymouth Pelargonium and big plants of Abutilon; the semi-double pale pink and red Dr. Weldeman Fuchsias with standards of Fuchsia Charming, which has deeper-coloured blooms; standard Fuchsias of Mrs. G. Palmer variety in association with the dwarfer Fairlight, a variety of the Ballet Girl type, but superior; Heliotrope with an edging of Ageratum, this bed being especially planted to provide perfume; Ophiopogan Jaburan with bush specimens of Iresine and the feathery-leaved Albizzia lophantha; Fuchsia Golden Treasure and F. gracilis interspersed with small pyramidal Junipers. These are only a few of the many pretty beds noticed in the sub-tropical garden, and the flowers, with the different tones of green foliage of the various trees and shrubs, together with the cool green sward, make a composition in harmony that excels in beauty and effect.

THE Parks Committee of Glasgow Corporation has recommended the appointment of Mr. William Besant, curator of Kelvingrove Park, as assistant director of parks. The recommendation was originally made by a special subcommittee on the reorganisation of the Parks Department. Mr. Besant is a younger brother of Mr. Besant, of Glasnevin Botanic Gardens.

CULTURAL MEMORANDUM.

ROOT PRUNING.

Root pruning is a practice about which there is considerable controversy, but under certain conditions it may prove of the greatest value in changing the disposition of over luxuriant trees to form wood growth into a disposition to form fruit buds.

It does not always ensure the ends for which it is resorted to. In some instances the wrong time is chosen for the operation, in others it is conducted in an injurious manner, while not infrequently it is adopted without sufficient reason in direct opposition to the old adage, "let well alone." In all cases where fruit trees are making a fair promise of fruitfulness, root pruning should not be undertaken, as it is more likely to prove harmful than beneficial. It does happen sometimes, however, that in places where the climate is eminently favourable to fruit production the trees make an excessive amount of growth, and in such cases judicious root pruning may bring them to a bearing state.

The season for root pruning should not be deferred until after the fall of the leaf; a better time for the operation is as soon as the growth of the season is completed and while the trees still retain their foliage. Several advantages accrue from carrying out the work during late September and October, and completing it before the fall of the leaf. In the first place any check given now will tend to the ripening of buds already formed, but which might start into growth and be lost in the event of the autumn proving warm and moist. Further, the soil is now sufficiently warm to promote a speedy healing of the wounds the pruning will occasion and the production of surface fibres from the cut ends of the fleshy roots, these fibrous roots being the very aid that the trees require to induce a condition of fruitfulness. Finally, it is usually much easier to carry out the work now than later, when unfavourable weather conditions may cause weeks or months to elapse before an opportunity occurs.

It should be remembered that the principal object of the pruner should be to discourage the formation of deep tap roots, which go far down into cold clay or wet gravel, and encourage the formation of an abundance of surface fibrous roots that will always be benefited by the influence of light and air. It should therefore be clearly understood that hacking and chopping of the roots is not to be desired. Clean cuts heal quickly and the roots when healed soon develop fibres, while bruised roots die back and foster disease. Such roots, therefore, as are injured by the spade should be trimmed cleanly by means of a sharp knife.

It is usually good practice to prune the roots on one side of the tree only in the one year, and to complete the work on the other side the next. In any case a trench should be opened at a sufficient distance from the tree to leave untouched a large mass of soil immediately surrounding the stem. When the thick and far-extending roots have been cut through all the prunings should be carefully collected and removed. In the process of filling up the trench good, turfy loam with a liberal addition of lime rubble and coarse bone-meal should be used, to encourage the production of a dense mass of fibrous roots.

It is a common mistake to suppose that a poor soil is the best to use in place of that taken out of the trench, the error being founded on the consideration that excessive luxuriance implies the existence of an excess of nourishment in the soil, whereas it may imply a deficiency of suitable food for the production of fruit and an excess of that required for the growth of stem and branch. Frequently trees grow freely in a wet soil, and in many cases where fruit trees make much growth and bear little fruit drainage may be needed much more than root pruning. Those contemplating planting fruit trees this autumn where the soil is known to be of a wet nature would do well to plant on slight mounds. This is often done with a view to restricting wood growth and inducing fruitfulness. *W. Auton, Pyrford Court Gardens, Woking.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante, pp. 71-76.)

(*Continued from page* 162).

ENGLAND, S.

WILTSHIRE.—The fruit crops are very disappointing. Apple trees blossomed profusely, but a late frost during May destroyed a large quantity of the blossom, particularly on bush trees; standards flowering at the same time escaped injury, and are carrying good crops. Pears are very scarce. Peaches and Nectarines are thin crops. Gooseberries were plentiful and of excellent quality. Strawberries suffered from the dry summer, although we had plenty of berries, but they were very soon over. King George and Givon's Late Prolific withstood the drought best, and furnished some excellent fruits. Red Currants and Loganberries were both good, but Black Currants were a thin crop and of poor quality. Plums promised well, but a good deal of the fruits dropped. Nuts are a failure; the bushes had plenty of female flowers, but no catkins. *J. Yandell, The Manor Gardens, Ramsbury.*

ENGLAND, N.W.

CUMBERLAND.—Apples, Pears and Plums are all failures—four Apple trees, Washington, Gladstone, James Grieve and Ribston Pippin enjoying the shelter of a wall from a series of east, north-east, and northerly winds, alone escaped injury. Pears on walls are also a total failure. On April 19 we had 10° of frost, and on the 23rd of the same month 12°, followed by the winds in question. Strawberries were our most plentiful fruit, but dry weather made the Strawberry season short. Climatic conditions of the autumn of 1922 and the spring of 1923 are, I think, responsible for the fruit deficiencies of the present year. Our soil is a fairly heavy loam, resting on sandy gravel. *J. Service, Holme Hill Gardens, Dalston.*

——Apples, Pears, Plums, Cherries and Black Currants, also Peaches, Nectarines and Apricots are practically all failures in this district. Gooseberries, Red Currants and Strawberries were good crops, but very late. It is the worst season I can remember, spring and early summer being wet and sunless. The soil is of a heavy, tenacious nature, but I think the cold north-east winds caused the failure of the fruit crops, also the wet, sunless autumn of 1922 prevented the ripening of the fruit buds. *James Tait, Justicetown Gardens, Carlisle.*

LANCASHIRE.—Continual frosts in May practically ruined the fruit crops. Pears and Plum trees set no fruit. Apple trees and Gooseberry bushes set a fair number of fruits, but eventually shed most of them. The Apple crop is the worst I have had for over 50 years, and in all my experience in these gardens I never remember such a complete failure of the fruit crops. The frosts were followed by a plague of aphis, and most of the trees are only now making clean, healthy growth. *W. Upjohn, Hall Gardens, Worsley.*

WESTMORLAND.—We did not expect good crops owing to the unripened state of last year's wood. Apples, Pears and Plums were weak in blooming, and the bloom that did develop was injured by severe weather in May; in consequence fruit is very scarce, but the foliage is clean and healthy. Gooseberries and Currants were bumper crops, and Strawberries were good, but ripened later than usual. The soil is a gravelly loam. *W. A. Miller, Underley, Kirkby Lonsdale.*

——All orchard trees showed signs of last season's dull, cold weather, with the result that little or no bloom developed on Apples and Pears. I never saw foliage so free from insect pests. Bush fruits and Strawberries were very late in ripening. The soil here is heavy in texture, on a clay subsoil, and the gardens are 760 ft. above sea level. *James Jeffrey, Lowther Gardens, Penrith.*

ENGLAND, S.W.

CORNWALL.—I doubt if the fruit crops in this district have been quite so bad during recent years. No frost was registered on any two consecutive days for the whole winter. During the latter half of 1922 we experienced a dismal, wet time, with little or no sunshine. The spring of this year was characterised by one long, low temperature with only occasional bursts of sunshine, and this continued until midsummer. During the time when most of the fruit trees were in blossom we had frequent showers of hail; not heavy, but small hail accompanied by rain and strong, cold winds. When pruning I found the wood as soft as cheese, and when the blossom opened it neither had strength nor substance to give me any hope of a fruitful year. *Harry Williams, Tolvean Gardens, Redruth.*

DEVONSHIRE.—Apple trees bloomed freely, but the fruits failed to set through lack of rain, I think. Pear trees developed very little blossom; we had good crops of Pears the last two years. Plums, Cherries and Peaches are very much under the average yield. Black Currants were the worst of small fruits. Silverleaf is again prevalent on some Plum trees. *G. Sleep, Hartland Abbey Gardens, N. Devon.*

SOMERSETSHIRE.—The fruit crops are under average. Some Apple trees have fairly good crops, but the majority of them are without fruit. Pears are a failure, except for a few scantily placed fruits on the ends of shoots. Plums, on the contrary, are an average crop, but Damsons are not so numerous as last year. Cherry trees flowered finely, but dropped their fruit considerably; some Morello Cherry trees had fair crops. Peaches are a good average crop. Some sorts of Nectarine cast a good many fruits. Apricots were unhappy in the early spring, but the trees have since recovered. Bush fruits were again very good, Black and Red Currants and Gooseberries especially; Strawberries, too, have had good crops, late ones doing well. We had a poor spring and early summer, cold winds were constant, sunshine lacking, rain wanted: I am inclined to think, however, that lack of sunshine last summer has much to do with the poor crops of fruit this season. The most serious disease hereabout is the silvering of fruit trees, and I notice in some gardens that Apples are now getting silver leaf somewhat, which is much to be regretted. *James Glasheen, Hestercombe Gardens, Taunton.*

——All fruit trees, excepting Pears, flowered well, but owing to cold winds and wet weather the fruits failed to set. There are a few isolated trees here and there in the garden and orchard which are bearing fair crops, but, on the whole, 1923 is a lean year for fruit in this district. Everything suffered from drought in early summer, although we had a very wet spring. June only gave us .53 inches of rain, and barely 2 inches fell in May, when rain is mostly needed. Our soil is a red loam, overlying shale on a northern slope. *Grigor Roy, Halswell park Gardens, Bridgwater.*

GLOUCESTERSHIRE.—It is a very disappointing fruit year. Pears are a complete failure: the trees produced scarcely any blossom. Plums flowered freely and appeared to set fruit, but the crop was completely ruined and the trees were rendered almost leafless by persistent attacks of aphis. Only a few varieties of Apples are carrying medium crops of fruit. Apricots are practically nil. Cherries were a very thin crop, whilst there is a good sprinkling of fruit on Peaches and Nectarines. Strawberries were good and up to the average, and Gooseberries were abundant. Currants and Raspberries were fairly plentiful, but the latter needed rain badly. *Frank J. Clark, Westonbirt Gardens, Tetbury.*

——So far as we are concerned in these gardens, this is a very lean year for fruit. Pear trees, all of which bore heavy crops last year, are looking very well, being clean and without pests, but they have no fruit. There is scarcely any fruit on Apple or Plum trees. These bore heavy crops last year, and were badly attacked with caterpillar and aphis; some trees were almost stripped bare of foliage. May was a bad month for spraying here on account of high winds. This season I am more convinced than ever that gardeners should prepare for spraying by having their sprayers and insecticides ready to deal with the first raids of fruit tree pests. *John Banting, Tortworth Gardens, Falfield.*

(*To be continued.*)

HOME CORRESPONDENCE.

Pelargonium Rollison's Unique.—While interest rests upon this plant, may I ask the attention of readers to the point of its flowering in two colours? Beyond my own remark nothing has been said about this, and yet its occurrence must have been noticed by a good many. I have been disappointed that my own plant has not presented the phenomenon, and I have begun to wonder whether it is possible to strike from a cutting that could not produce it. What precisely does it mean? There would be great interest, I believe, if someone would send a branch from which both colours proceed to some scientific authority, perhaps to a meeting of the Scientific Committee of the Royal Horticultural Society (it may now be late for this year perhaps). From the fact that the second colour may be waited for with some hope of seeing it, I have thought that something more than a mere sport is in question. There is a considerable amount of interest in the dual composition of a plant. What indeed is the nature of a sport? Is it something that separates out, or can it be said to originate *de novo*? Consideration of the subject by no means ends with these questions, and there would be great interest in an account of the various happenings. *R. Irwin Lynch, V.M.H.*

Pollination of Cherries.—Miss M. B. Crane, of the John Innes Horticultural Institution, asks in *Gard. Chron.*, September 8, for further information as to the Cherry to which I referred on page 120, under the name of Knight's Black. Miss Crane's experiments have been carried out so very carefully and with such forethought that I think my own experiments only tend to confirm those which she has already conducted. I have little doubt that the variety of Cherry to which I referred under the heading of Knight's Black was undoubtedly wrongly named, and probably was Bohemian Black Bigarreau. Unfortunately, the large standard tree which I used for my experiments was badly attacked by the disease generally referred to as "die back," and was grubbed up and burned last autumn. The fruits, which were large, were very even and regular in their outline, and the stalks were only about one inch in length. The stones were roundish and medium-sized. These three points are, I believe, characteristic of the Bohemian Black, whilst I find that the fruit of Knight's true Early Black is generally irregular and uneven on its surface. The stalks of this variety also are generally between one-and-a-half and two inches long, and the stones are also rather rounder and generally on the small side. I myself have been considerably puzzled by Knight's Early Black fertilising Early Rivers; but I have little doubt that Miss Crane has solved the problem in her most interesting letter. *Enthusiast.*

Cotoneaster frigida.—I do not understand Mr. White's note about Cotoneaster frigida on page 146. He describes it as having "a large crop of red berries shortly to turn black." We have here many large plants of this species, between thirty and forty feet high, and I have never known the scarlet berries to turn black. These berries must vary in flavour on different trees, for the birds devour the fruit on some trees so soon as it is ripe, but leave it to hang through the winter on others. Having had to cut down some large C. frigida, I sent some logs to three different makers of golf clubs. They all agreed in pronouncing the wood to be the best material for club heads they had ever handled. *Herbert Maxwell, Monreith.*

——Your correspondent, Mr. J. E. White, states that "Cotoneaster frigida has a large crop of red berries shortly to turn black." As I doubt whether there is a black C. frigida, possibly he has, through inadvertence, confused it with C. Bacillaris, a Himalayan species which grows quite as tall, but more pendent in habit, and bears purplish-black fruits copiously. Many seedlings and young plants are to be found in the vicinity of old and established bushy trees. Both are strong growers and may be commended for planting for effect on the margins of tree clumps, side of rides, in spinneys, along banks of streams and still water, or even as solitary specimens. From a utilitarian purpose plants may be grown for providing material suitable to use as stakes, such as stack thatching pegs, and for horticultural use as packing stakes, and supports for plants in general. For this purpose, when the plants are well established they should be cut down yearly or in alternate years, and certain growths left to strengthen according to requirements—a practice much in use with Hazels. They are therefore a good substitute for Bamboos, and although not so durable, they are nevertheless more natural and less rigid and appear better as supports to plants in show houses than Bamboo canes. *C. F. C.*

St. Cuthbert's Cole.—I have pleasure in supplying the data on which I conclude that St. Cuthbert's Cole is identical with Cuthertdole, Cutbertill, Sea Dock, Seehock, Brank ursine and Althaea officinalis. But, firstly, it may be stated for the information of those who are unacquainted with the *Dictionary of English Plant Names* that St. Cuthbert's Cole and Seehock are not included among the names in that valuable book of references. To make the matter as clear as possible, it is important to understand that Acanthus (mollis) is first stated to have been cultivated in England in 1548, under its common name, Branke ursine. It is also important to know that a plant celebrated for its medicinal properties and which for any reason was not cultivated in England, had a native plant substituted for it and was known by this name. Aristolochia and Zedoary are instances. So it happened likewise with Brank ursine. Its emollient properties were known, and the native plant that possessed similar properties was Althaea officinalis, which naturally received the name. On the Continent, strangely enough, Hieracleum Spondylium was Branca ursina. It will be seen from the few abstracts which follow that Acanthus mollis could not be the plant referred to, but that Althaea officinalis conforms, from the locale it prefers—sea marshes. "Sea docke is Branke ursine"; "Branca ursina a(ngli)ce, sedokke"; "Branca ursina herbaest, an(glice) seehock." The last is sufficient of itself to prove the plant to be Althaea officinalis. With regard to St. Cuthbert's Cole, the following references will suffice to show that it is the same plant. "*Caulus Sti. Kutherti respice in malua.*" On referring to "malua" we find "*Malva silvestris—altea idem., anglice merch malue, caulis Sancti Cutberti—idem.,*" and, lastly, "*Eviscus altea idem—anglice, Seynt Cuthertscole.*" With this compare the badly-spelled Cutbertdole which Gerarde probably wrote, not from a book but from hearing.

(Will readers kindly note that by a slip of the pen Duchess of Sutherland (page 136) was written for Lady Scarborough.) *R. P. Brotherston.*

Hardiness of Cobaea scandens.—As an instance of the mild winter of 1922-3 and our temperate climate, I have here some four or five plants of the greenhouse climber Cobaea scandens that have withstood last winter out-of-doors without any protection whatever, and have been flowering this season for a long time. Have any of your readers a similar experience? *C. Orchard, The Cottage, Smoglands, Bembridge, I.W.*

Grease-Banding.—The present is the best time to apply grease-bands to fruit trees, and the work may be done easily, expeditiously and proficiently by girls and women. In the case of half-standard and standard trees the band should be placed around the stem at a distance of three to four feet from the ground, tying it securely at the top and bottom. Smear the band with a thin coating of the grease composition, using a thin, flat piece of wood to apply it. A width of about four inches should be greased, leaving the top and bottom of the band quite clear. Allow the wrapper to remain on the tree until July. Amongst the various larvae now ascending the trees are those of the winter moth, the March moth, the mottled umber moth, and, later in the season, the Codlin moth. The bands will also catch many other insects that are migrating to the trees. *Pomona.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 18.—There was a beautiful exhibition in connection with the fortnightly meeting held on Tuesday last in the Society's Hall, Vincent Square, Westminster. The full capacity of the building was taxed to hold the exhibits, some being staged in the Orchid annexe. Late summer and autumn flowers, such as Dahlias, Chrysanthemums, Gladioli, Roses and Montbretias were shown in big masses, whilst miscellaneous groups and hardy border flowers also contributed to a brilliant display. There were a few Orchids, several collections of Carnations and a very attractive group of Liliums. Two excellent groups of pot fruit trees were exhibited by Messrs. T. Rivers and Son and Mr. J. C. Allgrove respectively.

Three new Orchids received Awards of Merit and four novelties each received a similar award in the floral section.

A new Apple named George Neal was given an Award of Merit, following an inspection of the tree by a sub-committee of the Fruit and Vegetable Committee. Mr. H. J. Jones added to his long list of successes in being awarded a Gold Medal for a superb group of Dahlias.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Messrs. Jas. O'Brien (hon. secretary), Gurney Wilson (assistant secretary), H. T. Pitt, J. E. Shill, H. G. Alexander, C. J. Lucas, Arthur Dye, Fred. K. Sander, E. R. Ashton, Pantia Ralli, J. Wilson Potter and R. Brooman White.

AWARDS OF MERIT.

Cypripedium Godefroyae leucochilum Gatton Park var., from Sir JEREMIAH COLMAN, Bt., Gatton Park (gr. Mr. Collier). A very fine form of the section which approaches C. bellatulum in colour, and in the present instance in size and shape. The large dorsal sepal and broad, extended petals are white with a heavy veining of deep claret-purple extending to the margin. The lip is white and unspotted, except for a few slight dots.

Laelio-Cattleya Aureole var. Renown (*C. Iris* × *L.-C. luminosa*), from PANTIA RALLI, Esq., Ashtead Park (Orchid grower, Mr. Farnes). A very distinct addition to the class and one of the brightest. The sepals and petals are clear chrome yellow; the lip is ruby-purple with a narrow, yellow margin and lines at the base.

Vuylstekeara Medea (*Odontioda Zenobia* × *Miltonia Charlesworthii*), from Messrs. CHARLESWORTH AND Co., Haywards Heath. A pretty novelty shown with its first flowers. The flower has the Miltonia shape, but the colour is derived from the Odontioda parent. The little plant bore a spike of several flowers. The sepals and petals are deep ruby-claret, the base of the lip being of the same colour and the pink front densely spotted with purple, there being blotches in the centre.

GROUPS.

Messrs. SANDERS were awarded a Silver Flora Medal for a very pretty group rich in good plants. At the back of the group were splendid specimens of the true Oncidium Marshallianum which this firm has been fortunate in introducing lately, with noble branched spikes of yellow flowers. Laelio-Cattleyas and Cattleyas, including a fine form of C. Thebes and white and coloured C. Hardyana, were well shown, and among species noted were the beautiful Miltonia spectabile conspicua of the same class as their M. s. extraria recently certificated, and two pans of their fine type of Cypripedium Godefroyae.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was awarded a Silver Banksian Medal for an interesting group in which Brasso-Cattleya Corallina, with very large, mauve flowers, and the brilliantly coloured Sophro-Laelio-Cattleya Isabella were prominent. The species shown included the pretty Chondrorhyncha Chestertonii, Brassia Lawrenceana longissima, the singular Bulbophyllum barbi-

Digitized by Google

gerum, and the elegant Cirrhopetalum gracilimum.

Messrs. STUART LOW AND Co., Jarvisbrook, Sussex, were awarded a Silver Banksian Medal for a small group of showy hybrids, among which fine yellow Brasso-Laelio-Cattleya Thyone Joyce Hanmer, forms of Cattleya Hardyana and other showy hybrids were well displayed. The pretty Miltonia Binotii, a natural hybrid between candida and Regnellii, was well shown. The fine old species were represented by well-flowered Odontoglossum grande in several good specimens, forms of Cattleya Dowiana, the curious little Sigmatostalix radicans, Laelia Dayana delicata, white with purple lip; and other rare species.

OTHER EXHIBITS.

Sir JEREMIAH COLMAN, Bt., sent a basket of several of his elegant Spathoglottis Zebrina (Fortunei × plicata), the plants bearing over forty spikes, with flowers varying from white to yellow and light rose as the progeny approached either parent, but the majority of the blooms were yellow. Baron BRUNO SCHRÖDER, The Dell Park, Englefield Green (gr. Mr. J. E. Shill), showed a noble spike of Laelio-Cattleya Golden Glow (L.-C. luminosa × C. Venus), with eight rich yellow flowers with velvety crimson lips.

Messrs. CHARLESWORTH AND Co., Haywards Heath, showed a finely grown selection of hybrids, including Cattleya Hesta excelsa with a five-flowered spike of white flowers with a purple lip.

Messrs. COWAN AND Co., Southgate, staged some fine hybrids, including a grand form of their Laelio-Cattleya Nanon, Brasso-Laelio-Cattleya Muriel, with immense rosy-lilac flowers; two forms of Cattleya Thebes with very dissimilar flowers; Laelio-Cattleya Hassallii alba, one of the finest of white-petalled Laelio-Cattleyas, Cattleya Desdemona and good C. Hardyana alba.

Floral Committee.

Present: Messrs. H. B. May (chairman)) H. R. Darlington, H. J. Jones, Geo. Harrow, J. B. Riding, W. B. Gingell, W. Howe, S. Morris, Donald Allan, H. Dickson, D. B. Crane, J. F. McLeod, Reginald Cory, R. C. Notcutt, A. Turner, J. W. Barr, W. B. Cranfield, C. R. Fielder, C. Pearson, W. G. Baker, G. Loder, E. A. Bowles and W. D. Cartwright.

AWARDS OF MERIT.

Kniphofia Royal Standard.—A very graceful spike of medium size. The upper portion is composed of deep coral coloured flower buds which, when fully expanded, become Primrose-yellow. Shown by Mr. M. PRICHARD.

Montbretia Jessie.—The flowers are of rather more than medium size, rounded and slightly inclined to be cupped. The centre of the bloom is yellow, and this colour is freely stippled with orange on the remaining third of the petals. The exterior is heavily flushed. Shown by Mr. S. MORRIS.

M. The Princess.—Another very beautiful variety, which differs from the foregoing in that the yellow zone is marked with crimson lake and the outer portion of the petals is deep orange coloured. Also shown by Mr. S. MORRIS.

Pyrus earlhamensis.—A fruiting branch bearing several "Apples" of irregular size was shown. These fruits were highly coloured, but not more so than on many cider Apples, now to be seen in quantity in Devonshire. The flesh of the fruits is also highly coloured. Shown by Mr. S. MORRIS.

New Dahlias.

The Joint Dahlia Committee found a large number of seedling Dahlias awaiting inspection and selected the following for trial at Wisley next year. It was made clear that none of the novelties would be considered unless the senders undertook to forward plants to the trial grounds next spring.

Gwynne.—A small Paeony-flowered variety which is almost a single. It is of rich velvety crimson colour with a darker centre.

Thursa.—A small Decorative bloom with pointed florets and of deep scarlet colour.

Violetta.—A Paeony-flowered variety of rather more than medium size and bright mauve colouring.

Emblem.—This is a well-formed Decorative variety of rosy mauve colouring with a few golden yellow lines along and at the tips of the florets.

Sylpe.—A large Paeony-flowered variety of sparkling blush lavender colour. The above were shown by Messrs J. BURRELL AND SONS.

Nero.—A richly coloured Pompon Dahlia of perfect form and rich crimson maroon colour. Shown by Messrs. J. CHEAL AND SONS.

Reading Star.—A very showy and highly decorative Star variety of rich crimson colour with the florets tipped with maroon. Shown by the UNIVERSITY COLLEGE GARDENS, Reading.

Snowdrift.—A large Cactus Dahlia of perfect exhibition shape. When first open the florets are a good white, but they soon become discoloured. This and the two following varieties were shown by Mr. H. SHOESMITH.

Lenny.—This is a medium-sized Decorative variety. The florets are of thin texture, but it is a very pretty flower of pale yellow colour regularly flushed with rosy-purple.

Winnie Hardy.—A very Decorative Cactus variety of medium size and beautiful incurving florets. The colour is a deep rosy mauve, lightly tipped with gold.

Lydia.—This is a rather large Star Dahlia of clear Primrose-yellow colour. Shown by Mr. CHAS. TURNER.

Dot.—A small Collerette. The roundish white ray florets are margined with deep crimson on the lower half, and this colour alternates with white on the short quills. This and the following varieties were shown by Messrs. J. STREDWICK AND SON.

Rocket.—A large Cactus variety with narrow florets of rosy mauve colour and a paler centre.

Magpie.—A large Decorative variety made up with broad florets of velvety crimson colouring tipped with white.

Phosphorus.—A very large Single of bold appearance, with slightly rolled florets and of yellow colour.

Beacon.—A Decorative variety with the appearance of a coarse Cactus. The colouring is magenta-crimson. It has very long stems.

Vera.—A medium-sized Decorative variety of compact habit. The scarlet florets are flushed with crimson and have white tips.

Rector.—A mauve flushed Decorative variety of large size with a few chocolate spots. An uncommon but not very beautiful flower.

L. Hancock.—A large flattish Decorative variety with broad, thin florets of pale scarlet colour lightly flushed with crimson.

Mrs. E. G. Cant.—A well set-up Decorative variety of pale orange-buff colouring, which becomes flushed with age. It is somewhat star-shaped.

Lucien.—A very good, large Decorative variety of Primrose-yellow colour.

Polar Bear.—A large Decorative variety of excellent form, with pure white florets. Shown by the Hon. VICARY GIBBS (gr., Mr. E. Beckett).

GROUPS.

Dahlias were again shown in considerable quantity, and, generally, of high quality. Just inside the entrance Mr. H. J. JONES set up a very large collection, though not quite with his accustomed skill—there was an unfortunate division between the tall stands of large Decorative and Paeony-flowered varieties intermixed with Pompons and the lower masses of bloom. But the group included a great many varieties of decorative appearance and it made a very attractive show (Gold Medal).

Messrs. CARTER, PAGE AND Co. had a very fresh collection of Dahlias on the opposite side of the hall, and while this included nearly all of the types, it was particularly strong in the Decorative and Cactus sections. Of the former, Prince of Wales, Fireman and The Prince were very attractive, whilst of the latter, Masterpiece, Fireflare and White Queen were especially noteworthy. They also showed many excellent small Decorative and Paeony-flowered varieties (Silver Flora Medal). Messrs. J. CHEAL AND SONS included many valuable varieties of their numerous Star Dahlias, and also of the dainty Pompons in their collection. Of the latter Ruby, claret-coloured, Darkest of All, Bacchus, wine-red, Nerissa and Girlie, mauve shades, were very delightful. Their Singles were also perfect in form and colouring (Silver Flora Medal).

A very fresh collection was arranged by Mr. J. T. WEST, and in this the highly decorative miniature Paeony-flowered types were very prominent. Of these we were impressed by Rainbow, Floss, Blue Coat and Lovely, while Arthur Twitchett and Mrs. C. A. Gillatt, of the Cactus varieties, were also splendid examples (Silver Flora Medal). Mr. J. B. RIDING had a prettily arranged little group in which there were many excellent Collerettes as well as other types. The Collerettes included Giant of Lyons, Tweed, Iona, M. Poirier, Ulva and Regularity (Silver Banksian Medal).

A fresh and bright collection of Dahlias was contributed by Mr. CHAS. TURNER. His large Paeony-flowered varieties, such as Coralie, Christine, King Harold and Phidias were exceedingly beautiful (Silver Banksian Medal). A small collection of very meritorious seedlings was exhibited from the UNIVERSITY COLLEGE GARDENS, Reading, and included Vive la France, Thos. Ewbank and Reading Star, which are to be grown for trial at Wisley next year (Silver Banksian Medal). Mr. H. WOOLMAN included Dahlias with early-flowering Chrysanthemums (Silver Banksian Medal).

Montbretias of especial merit were arranged by Mr. S. MORRIS, and these included, besides several exceedingly beautiful seedlings, His Majesty, Joan of Arc, Pamela and James Coey (Silver-Gilt Banksian Medal).

In a corner space Messrs. JAMES CARTER AND Co. arranged a large and very charming group of Lilium speciosum and the variety album (Silver Flora Medal).

Gladioli were again shown in considerable quantity by Messrs. KELWAY AND SON. Their excellent large-flowered varieties included King of Gladioli, Flame of War, Gunn, Sir M. Hicks-Beach and Prince Ito, while they also staged many good Primulinus hybrids (Silver Flora Medal). Messrs. R. H. BATH, LTD., had many Gladioli with Delphiniums. The former were chiefly of such good Primulinus hybrids as Brilliance, Prince of Wales, White Giant, Corry and Red Emperor (Silver-Gilt Banksian Medal). Mr. A. EDWARDS showed a good collection of Primulinus hybrids (Bronze Flora Medal); while Messrs. LOWE AND GIBSON included Orange Brilliant, Ulrica, Zanthia and Fire Queen amongst their very beautiful Primulinus hybrids, and also staged excellent examples of the large-flowered type (Silver Flora Medal).

Carnations were extensively shown by Messrs. ALLWOOD BROS., who had two exhibits. One included many vases of Dianthus Allwoodii, and in the other there were good stands of George Allwood, a sweetly scented soft pink bloom with serrate edges; Edward Allwood, brilliant red, Wivelsfield, claret and Laddie (Silver Flora Medal). Mr. C. ENGELMANN had a number of very useful commercial varieties, which may be relied upon to bloom freely, and these included Cupid, Topsy and Salmon Enchantress (Silver Banksian Medal). Messrs. STUART LOW AND Co. associated such Carnations as Eileen Low, Red Ensign, Winter Glow and Lord Lambourne with Roses (Bronze Flora Medal).

Seasonable border flowers were staged in generous quantities by many growers. Messrs. HARKNESS AND SONS had a very bright display of Kniphofias, Liliums, Gladioli, Phlox and the yellow Gaillardia E. J. Anderton (Silver Flora Medal). Messrs. ISAAC HOUSE AND SON showed good blooms of their Scabious (Silver Flora Medal). In a corner space Mr. ERNEST BALLARD set up such Michaelmas Daisies as Little Boy Blue, Lavender and Pioneer (Silver Banksian Medal). Messrs. MAXWELL AND BEALE built a pleasing little rockery and furnished it with Ericas and other flowers (Silver Banksian Medal).

A great many Kniphofias at the back of Mr. M. PRICHARD's collection were very effective, and drew attention to the quantities of other flowers (Silver Banksian Medal). Mr.

Digitized by Google

F. C. WOOD had an artistic vase of the purple Pentstemon Kellermannii, and foliage of Prunus Pissardii, and also included Pentstemon Newbury Gem, Physalis Franchettii and Lobelia cardinalis in an interesting collection (Silver Banksian Medal). Mr. G. G. WHITELEGG showed a tasteful group of Delphiniums, Gladioli, Kniphofias and other seasonable border flowers (Silver Banksian Medal).

Liatris pycnostachya, many Michaelmas Daisies and Blue Gentians were prominent in an exhibit by Mr. W. WELLS, JUNR. (Silver Banksian Medal). Messrs. W. CUTBUSH AND SONS had a collection of named Pentstemons (Bronze Flora Medal). Messrs. REAMSBOTTOM AND Co. showed blooms of St. Brigid Anemones (Bronze Flora Medal).

Excellent Violas were set up by Messrs. WM. ARTINDALE AND SON (Silver-gilt Banksian Medal), and Mr. H. GANDELL (Silver Banksian Medal). The former also showed Gladioli and The Rocket Kniphofia. Mr. T. CARLILE had especially good Delphiniums and Kniphofias (Silver Flora Medal). THE CENTRAL GARDEN SUPPLIES showed Roses and hardy border flowers. Mr. B. PINNEY had Violets and Asters. Messrs. RICH AND Co. showed border flowers, and Mr. J. KLINKERT had a collection of Topiary specimens.

In the annexe Mr. L. R. RUSSELL arranged a very good collection of well flowered Clematis. The garden varieties included Ville de Lyon, Jackmanii superba, Madame Jules Correvon and Mrs. Spencer Castle, and they also had a couple of plants of the interesting Clematis tangutica obtusinscula, bearing its uncommon pendulous little yellow flowers (Silver Banksian Medal).

Roses, no doubt in anticipation of the Autumn Rose show, were staged by Messrs. WM. PAUL AND SON, Messrs. WHEATCROFT BROS., and the Rev. J. H. PEMBERTON (Silver Flora Medals).

Fruit and Vegetable Committee.

Present: Messrs. J. Cheal (in the chair), W. Lobjoit, P. C. M. Veitch, Geo. F. Tinley, S. B. Dicks, W. F. Giles, G. Reynolds, E. Neal, T. Pateman, John Basham, J. C. Allgrove, Geo. Keif, H. Markham, W. Bates, W. H. Divers, E. A. Bunyard and A. N. Rawes.

AWARD OF MERIT.

Apple George Neal.—This is a dual-purpose Apple, as it may be used either for dessert or culinary purposes, although it would probably be classed as a cooking sort. It is a fine-looking Apple, somewhat of the shape of Lane's Prince Albert, and was discovered growing in a cottage garden at Oxford. The original tree has a stem six feet tall and a head eighteen feet in diameter. A sub-committee was appointed to inspect the tree and their report stated that it was very healthy and well set with fruit spurs, also that younger trees were bearing well and had made young wood of moderate growth with a reddish bark. The mid-rib of the leaf is also tinted red. The late Rev. W. Wilks tested the variety and reported favourably on its cooking qualities. The variety was also recommended for inclusion in the trial of commercial varieties at Wisley. The season is September. Shown by Messrs. R. NEAL AND SONS, Wandsworth.

GROUPS.

Messrs. T. RIVERS AND SONS were awarded a Silver-Gilt Hogg Medal for a collection of pot fruit trees. They showed Plums principally, but included a few Peaches and Figs. The Plums are exceptionally well grown and fruited, and included such sorts as Coe's Golden Drop, Coe's Violet, President, Rivers' Late Orange, Grand Duke, White Magnum Bonum and Late Orange, the last with fruits of remarkably large size. Trees of Princess of Wales, Sea Eagle and Lady Palmerston Peaches were also fruiting finely, while a few small pot Figs added variety to the collection.

A somewhat similar exhibit was staged by Mr. J. C. ALLGROVE, who was awarded a Silver Hogg Medal. He made a feature of his new Allgrove's Superb Plum, which is a coloured form of Jefferson. Both bush and espalier trees of this and other Plums were shown, the most notable varieties being Early Transparent Gage, Jefferson and Victoria. Espalier trees of Crimson Galande Peach were finely cropped. At either end of the exhibit were included plants of Rubus laciniata bearing a profusion of berries.

ROYAL CALEDONIAN HORTICULTURAL.

September 12 and 13.—The autumn show of this society was held in the Waverley Market, Edinburgh, on these dates. Unfortunately, the weather completely broke down on the second day, and this affected the takings at the gates so much that they were about £80 less than last year, which, however, was a record year since those preceding the war. The entries in the competitive classes were nearly fifty per cent. fewer than last year, the deficit being almost wholly in the fruit and vegetable classes. The Grapes especially were poor in quality, and there was also a great falling off in the quality of the hardy fruits, owing to the bad season. The traders' exhibits were, however, considerably in excess of those of last year, and the show was, on the whole, an excellent one. The Edinburgh and District Garden Allotments Federation again held their annual exhibition in connection with the show.

GARDENERS AND AMATEURS.

Fruit.—In the class for a table of twelve dishes of fruit, decorated, there was only one entry, EARL BALFOUR, K.T., Whitingehame, East Lothian (gr Mr. G. F. Anderson), who was awarded the first prize, consisting of £5 5s., with the Laird and Dickson special prize of silver plate, to be won three times. The fruits shown were Grapes, Muscat of Alexandria and Madresfield Court; Peaches, Bellegarde and Dymond; Nectarines, Humboldt and Newton; Melons, Royal Sovereign and Superlative; Apples, Emperor Alexander and Rival; Pears, Souvenir de Congres and Williams' Bon Chrêtien.

In the class for eight bunches of Grapes, not fewer than four varieties, and not more than two bunches of any variety, there were two entrants, and the first prize, £4 and a gold badge, with the Thomson Challenge Trophy, to be won three times, was awarded to EARL BALFOUR, who obtained 60 points out of a possible 72. The second prize was awarded to Sir MICHAEL NAIRN, Bart., Dysart House, Fife (gr. Mr. J. F. Stewart), who obtained 45 points out of a possible of 70. The points awarded to Earl Balfour's bunches were:—

	Maximum Points.	Points Awarded.
1. Appley Towers	8	7
2. Appley Towers	8	7
3. Muscat of Alexandria	10	9
4. Muscat of Alexandria	10	8
5. Black Hamburgh	9	7
6. Black Hamburgh	9	8
7. Madresfield Court	9	7
8. Madresfield Court	9	7
	72	60

In the other Grape classes EARL BALFOUR was placed first for two bunches of Muscat of Alexandria, one bunch of Black Hamburgh, one bunch of Alicante, one bunch of Madresfield Court, and one bunch of Appley Towers. The EARL OF STRATHMORE, Glamis Castle, Forfar (gr. Mr. D. M'Innes) excelled in the class for four bunches of Grapes, distinct varieties, and for two bunches of Black Hamburgh; WM. CREE, Esq., Kailzie, Peebles (gr. D. Sharpe), showed the best single bunch of Muscat of Alexandria, and Mr. A. M'KINVEN the best bunch of Gros Colman.

LADY DUNDAS OF ARNISTON (gr. Mr. R. Mackenzie) was placed first for a green-fleshed Melon; the EARL OF STAIR, Oxenfoord, Midlothian (gr. Mr. A. C. Scott) for a scarlet-fleshed Melon; Mr. A. M'QUEEN, Dalkeith Gardens, for twelve Figs; Mr. WM. AITCHISON, Thurston Gardens, East Lothian, for six Peaches; EARL BALFOUR, for six Nectarines, and also for twelve purple Plums; FRANK J. USHER, Esq., Dunglass, East Lothian (gr. Mr. J. Notman), for twelve Apricots, twelve red Plums, a collection of dessert Plums, and a collection of culinary Plums.

For Apples and other fruits from plants permanently planted in the open air, ripe or unripe, except dessert Apples grown in Scotland, LADY ASKEW ROBERTSON, Ladykirk, Norham (gr. Mr. G. Little), excelled in the class for a collection of six varieties of Apples, five of each, and in the single-dish classes, six fruits of each kind, for the variety Lord Grosvenor. Mr. J. M'KENZIE, Lochend Gardens, Dunbar, was placed first for a collection of twelve varieties of Apples, five of each, grown in Scotland; J. J. BELL IRVING, Esq., Makerston, Kelso (gr. Mr. R. Auldjo), was placed first for six dessert Apples (ripe), grown in Scotland, for six fruits of James Grieve, and for six fruits of any dessert Apple. In the other single-dish classes, six fruits of each, EARL BALFOUR excelled for Grenadier and Lane's Prince Albert; FRANK USHER, Esq., for Lord Derby, Lord Suffield, Warner's King and Bramley's Seedling; Mr. J. P. REID, Aberlady, East Lothian, for Newton Wonder, Stirling Castle, and for any other variety not included in the list. VISCOUNT NOVAR, Raith, Fife (gr. Mr. D. M'Lean), was placed first for Worcester Pearmain; Mr. J. LAW, Dirleton, East Lothian, for Irish Peach; J. R. DALE, Esq., Seacliff, North Berwick (gr. Mr. N, Pattie), for Ecklinville Seedling and Golden Spire; and Mr. T. NICHOL, Earlston, for Peasgood's Nonesuch.

Mr. J. MACKENZIE, Lochend, Dunbar, obtained first prize for a collection of Pears grown in Scotland, in six varieties, four fruits of each. In the single-dish classes, six fruits, grown in Scotland, Mrs. ASKEW ROBERTSON excelled for Beurré d'Amanlis and Durondeau; J. R. DALE, Esq., for Jargonelle; and FRANK USHER, Esq., for Louise Bonne of Jersey.

PLANTS.—In these classes the first prizes were awarded as follow: Nine dwarf Ferns, Mr. J. MACKENZIE, Newbridge, West Lothian; three tuberous-rooted Begonias, single flowered, Mr. P. REID, Kirkcaldy; two tuberous-rooted Begonias, single and double flowered, Mrs. J. CAMPBELL, Dolphinton, Peebles (gr. Mr. W. Howieson); two Fuchsias, Mr. P. REID; one Fuchsia, A. DRYBROUGH, Esq., Gogarbank, Midlothian (gr. Mr. A. Findlay), and two Coleus, Mr. P. REID.

CUT FLOWERS.—The winners of the first prizes were: Twelve vases of Phloxes not fewer than eight varieties, three spikes in a vase, Mrs. REID, Thomanean, Milanthort (gr. J. Pearson); twelve Gladioli, not fewer than nine varieties, and also six Gladioli, distinct, Mr. D. WHITELAW, Laurencekirk; six bunches of collerette Dahlias, Mr. C. JENKINS, Cambuslang; twelve bunches of Sweet Peas, Mr. J. C. ROBERTSON, Stranraer; six bunches of Sweet Peas, Mr. G. ELLIOT, Hawick.

In the Rose classes, Mrs. RUSSELL, Newton Mearns, excelled for twenty-four blooms, not fewer than eighteen varieties; twelve H.T. blooms, distinct; a vase of six scarlet or crimson Roses, and also for a vase of six white Roses. Mrs. REID, Lauriston Castle, was placed first for a vase of six pink Roses; Sir BASIL MONTGOMERY, Kinross House, was first for six vases in six varieties, and one vase of Roses. Mr. J. PATERSON, Pumpherston, West Lothian, excelled in the class for twelve Fancy Pansies, Mr. H. ROBERTSON, Kelty, in that for twelve show Pansies, and Mr. J. NELSON, Dalkeith, for twelve bunches of Violas. VISCOUNT NOVAR was placed first for one vase of a white early-flowering Chrysanthemum, one vase of a yellow variety, and for one vase of any other colour of early-flowering Chrysanthemum not specified in the list. Mrs. ANDERSON, Auchterarder excelled for the vase of crimson-coloured Chrysanthemums. J. A. HOOD, Esq., Lasswade (gr. N. Leyden), was placed first for one vase of Michaelmas Daisies. SIR BASIL MONTGOMERY for three vases of Montbretia and six vases of Annuals. Mrs. ASKEW ROBERTSON for

Digitized by Google

four bunches of Antirrhinums; J. G. STEWART, Esq., Lasswade (gr. Mr. J. Mackay), for twelve Marigolds (French and African); Lt.-Col. T. G. M'LEAN, Melrose (gr. J. Stewart); Mr. P. F. BAUCHOP, Alexandria, for eighteen vases of hardy cut flowers, and J. DUNCAN, Esq., North Berwick (gr. H. Rutherford), for six blooms of double Begonias.

OPEN CLASSES.

Cut Flowers.—For a display of single and double Chrysanthemums on a table 12 feet by 5 feet, decorated with other plants, etc., Mrs. BOASE, Binrock, Dundee (gr. J. Beats), won the first prize, to which is also attached the Edinburgh Cup for Chrysanthemum cut blooms (to be won three times). The first prize for twelve vases of early-flowering Chrysanthemum cut blooms, disbudded, in not fewer than six varieties, which includes the Scottish Challenge Cup for cut blooms, was won by Mr. C. JENKINS, Cambuslang. Mrs. RUSSELL, Newton Mearns, was placed first for a dinner table, 10 feet by 5 feet, decorated with Roses.

Messrs. G. MAIR AND SONS, Prestwick, gained first honours for twenty-four spikes of Gladioli. In the Rose classes Messrs. H. DICKSON AND SONS, LTD., Belfast, excelled for thirty-six Roses, distinct; Mr. R. C. FERGUSON, Dunfermline, for eighteen Roses, distinct; Messrs. ADAMS AND CARMYLE, Aberdeen, for twelve red or crimson roses; Messrs. D. AND W. CROLL, Dundee, for twelve blooms of any pink Rose; Messrs. T. SMITH AND SONS, Stranraer, for twelve white Roses, and also for six baskets of Roses; Messrs. J. FAIRLEY AND Co., Cairneyhill, Fife, for twelve vases in twelve varieties, and also for six vases of garden or decorative Roses; and Mr. W. FERGUSON, Dunfermline, for twelve vases of garden or decorative Roses.

VEGETABLES.—For a collection of twelve kinds of vegetables Mr. J. GRAY, Uddingston, who had 58 points out of a possible of 76, was placed first, Earl BALFOUR being second, and Mrs. BOASE third. In the single-dish classes Mr. GRAY also excelled for Leeks and long Carrots, and the following were the other winners of the first prizes in these classes:—J. A. HOOD, Esq., Lasswade, for Cucumbers; Mr. R. MASON, Lanark, for Tomatos and Lettuce; Mr. R. A. GRIGOR, Dumfries, for Peas; Earl BALFOUR for French Beans and Cauliflower; Mrs. REID, Lauriston Castle, for Broad Beans, Cabbages, and Celery; Mr. P. LAWRIE, Kirknewton, for Savoys; Mr. N. FORREST, Biggar, for Kale, yellow Turnips and white Turnips; Mr. C. JENKINS for Beet and Parsnips; Mrs. ANDERSON, Auchterarder, for stump-rooted Carrots; Col. HEYWOOD LONSDALE, Shavington Hall, Market Drayton (gr. J. Mills), for Onions (the largest bulbs were approximately eighteen inches in circumference); Mr. DARLING, Edinburgh, for twelve Potatoes; Mr. R. W. E. COWPER, **Gogar House, Midlothian** (gr. R. W. Dingwall), for six Potatos; and J. J. BELL IRVING, Esq., Makerston, for twelve kidney Potatos and also for twelve round Potatos.

The silver cup presented by Messrs. J. W. Scarlett, J.P., and T. A. Scarlett, J.P., for the best exhibit in the vegetable section for collections in the Garden Allotments Federation was awarded for the year to Mr. W. KENNEDY, Liberton (South Craig Association). Mr. KENNEDY also won the silver medal for the best individual exhibit in the section.

NON-COMPETITIVE EXHIBITS.

The following awards were made to trade groups:—

Gold Medals and Special Appreciations.—To Messrs. AUSTIN AND M'ASLAN, Glasgow, for vegetables and flowers; Messrs. DOBBIE AND Co., LTD., Edinburgh, for Dahlias, Roses, Sweet Peas, etc.; Mr. THOS. ROBINSON, Nottingham, for Roses; Messrs. L. R. RUSSELL, LTD., Richmond, for foliage plants, Clematis; etc.; Messrs. STORRIE AND STORRIE, Glencarse, for fruit trees, etc.; Messrs. Sutton and Sons, Reading, for vegetables and cut flowers.

Gold Medals.—To Messrs. JOHN FORBES (HAWICK), LTD., for Antirrhinums, Phloxes, Pentstemons, etc.; Mr. DAVID KING, Murrayfield, Edinburgh, for rock garden.

Silver-Gilt Medals.—To Messrs, CUNNINGHAM, FRASER AND Co., Edinburgh, for herbaceous flowers; Messrs. ISAAC HOUSE AND SON, Westbury-on-Trym, for perennial Scabious; Mr. W. WELLS, Jr., Merstham, for herbaceous flowers.

Silver Medals.—To the CARSE OF GOWRIE NURSERY Co., Errol, for hardy fruit; Messrs. DICKSONS AND Co., Edinburgh, for Roses; Messrs. DOBBIE AND Co., LTD., Edinburgh, for Fuchsias; Mr. JOHN DOWNIE, Edinburgh, for Liliums, Gladioli, etc.; Mr. H. N. ELLISON, West Bromwich, for Ferns; Messrs. LAIRD AND DICKSON, Edinburgh, for Alpines; Messrs. TILLIE, WHYTE AND Co., Edinburgh, for vegetables, etc

Bronze Medals.—Messrs. BAKERS, Codsall, for a model garden and cut flowers; Mr. F. J. BELL, Whitley Bay, for Violas; Mr. W. BUNN, Malvern, for Cactus-flowered Geranium Fascination; Mr. E. J. PARSONS, Worcester, for Worcester Berry, etc.; Mr. LAWRIE, Carnwath, for Begonias.

AWARDS TO NOVELTIES.

First-class Certificate.—Fancy Pansy Mrs. Andrew Frater, exhibited by Mr. ANDREW FRATER, Kirkliston.

Awards of Merit.—Chrysanthemum Alex. A. M'Alpine (Goldfinch × White Masse), exhibited by Mr. ALEX. M'ALPINE, Braidfield, Tolcross, Glasgow; *Chrysanthemum Mary Colvin*, exhibited by Messrs. THYNE AND SON, Dundee; *Chrysanthemum Nellie Webber*, exhibited by Messrs. WEBBER AND SONS, Plymouth; *Collerette Dahlias Betty and Helen*, exhibited by Messrs. TORRANCE AND HOPKINS, Busby; *Collerette Dahlia Gleneagles*, and *Cactus Dahlia Glen Morangie*, exhibited by Messrs. DOBBIE AND Co., LTD., Edinburgh; *Fancy Pansy Dryden M'Coll* and *Viola Helen B. Sutherland*, exhibited by Mr. HUGH M'COLL, Preston House, Linlithgow.

ANSWERS TO CORRESPONDENTS.

CLUB ROOT: *E. E.* Club root may be eradicated from the soil by digging in in the autumn a heavy dressing of quicklime (¾ to 1 lb. per square yard). Lime, bone-meal, steamed bone flower, or basic slag may be used in the same way.

SOIL FOR EXAMINATION: *D. T.* The soil seems to be of a rather harsh nature, but we cannot undertake to analyse it. If you are a Fellow of the Royal Horticultural Society, you may send a sample for analysis to Dr. J. A. Voelcker, R.H.S. Gardens, Wisley, Surrey.

SPRAY FOR GRAPES.—*T. M.* We have no knowledge of the specific you mention, but if, as you state, it was tested at Wisley in 1919, you should write to the director there for particulars.

STEPHANOTIS IN FRUIT: *D. S.* Although the Stephanotis does not fruit freely under cultivation in this country, there are many records of it having done so, and such instances have been referred to from time to time in these columns.

VINE AND PEACH TREE: *F. A. S.* There is no necessity for the expense of building a brick wall. Prune the trees as soon as they are cleared of fruit, and root-prune them in September, or not later than October. It is useless to remove the rank growths without checking the gross roots. Take out a trench in a half-circle in front of each tree, about five feet from the stem, and work to within three feet of the stem and well underneath; remove strong roots pointing downwards and shorten back other gross roots, but take care of all fibrous roots and lay these horizontally from two to four inches below the surface. When filling in add lime rubble and burnt ash, with a good sprinkling of bone meal. Make the border firm as the work proceeds and thoroughly water the soil on two or three occasions. Syringe the trees to prevent flagging, and afford shade for a short time until the roots become active again.

REMARKS.—The general demand has been fairly brisk during the past week, and prices have been steady. English Apples, mainly Worcester Pearmain variety, have been a feature, and although the quantities marketed have been large, their value held firm. At the time of writing prospects point to higher figures being realised. Although Plums have been scanty, there has been a fair quantity of Monarch variety, and prices obtained must have been satisfactory to the growers. Large cookers are not plentiful, and continue in demand. Rather more Apples have arrived from the Continent, as well as from America, and the first consignment from Nova Scotia is due to arrive. Choice fruits such as Grapes, Peaches, Nectarines, Figs and Melons are quoted lower, the demand being slow and supplies heavier. Tomatos have fallen considerably in value, arrivals from all sources being heavy. Cucumbers are not quite such a firm trade. Field Mushrooms are plentiful. Scarlet Runners and Dwarf Beans are both cheaper. A few forced new Potatos from Guernsey as well as some home-grown tubers are on the market, but sales are difficult to arrange at a satisfactory price. Green vegetables are plentiful and cheap. The Potato trade is steady at level rates.

International Horticultural Congress at Amsterdam.

When the President and Council of the Royal Netherlands Horticultural and Botanical Society considered what method they should adopt to mark the jubilee of the society they hit upon the happy idea of celebrating this auspicious event by holding an International Horticultural Congress at Amsterdam, and to combine therewith tours to the principal centres of horticultural interest in the country, together with a few social functions. We understand that the president of the society, Jonkheer G. F. van Tets, was chiefly responsible for the general idea of the Congress, and it was largely due to his genius and geniality that the events followed each other in admirable sequence for a whole week. Jonkheer van Tets is one of the most prominent amateur horticulturists in Holland, consequently his interest in the proceedings and his knowledge of the subjects dealt with, coupled with his ability as a linguist, placed him in the happy position of being able to converse on horticultural and botanical matters with all comers. The Council of the Royal Netherlands Horticultural Society provided a very extensive and attractive programme, and this was carried out in practically every detail over the period commencing on Monday, September 17, and concluding on Sunday, September 23. The chief organiser was Dr. M. J. Sirks, of Wageningen, who acted as Congress secretary, and with whom were associated Jonkheer O. A. W. Repelaer, and Jonkheer C. Dedel. Dr. Sirks has a perfect genius for organisation, and we have nothing but the greatest admiration for his work throughout the Congress. He made arrangements for hotel accommodation for all the foreign guests, and by means of literature and tickets made everything easy for all visitors; he even arranged for the transfer of luggage from Amsterdam to The Hague and from The Hague to Arnhem. The tickets included those admitting the Congress delegates to the Zoological and Botanical Gardens, the Palace, Rembrandt's House, Lees Museum, and the horticultural exhibition. On page 191 we publish the full programme, *pour l'encourager les autres*. Educational interest was always kept in the foreground whether at the four sessions of the Congress or during the tours to Boskoop, Haarlem, Lisse, Aalsmeer, Rotterdam, Deist and Wageningen, but the social interest was not lacking; indeed, delightful hospitality was extended with gracious freedom everywhere, and as the programme was carried out with the amazing accuracy of a first class time table, and devolved no responsibility on the part of delegates—except that of keeping to time—there were ample opportunities for the horticulturists and botanists, representing twenty-two countries, to become acquainted with each other, and this we consider was one of the finest features of the Congress, because scientific, business and social intercourse widens the outlook and tends to produce those friendships which make for the peace, stability and happiness of the world. In the words of the Burgomaster of Amsterdam in his address of welcome, "Reconstruction is the pass word of the present time, restoration of the international relations; restoration also of co-operation between the nations is that which the world needs beyond anything else, and it is this very aim the present Congress has in view to reinforce the existing ties and to enter into new relations by discussing questions of horticulture and botany." Many of the papers read at the Congress and a large number of speeches at the various functions were in English; indeed, the highest compliments possible were paid to the British representatives, including presentation to Her Majesty Queen Wilhelmina at the Huis ten Bosch, The Hague. In these circumstances it was unfortunate that Prof. R. C. Punnet, of Cambridge, and Mr. F. J. Chittenden, of Wisley, were unable to attend and read the papers they had promised, consequently the Royal Horticultural Society was not officially represented. However, a telegram of congratulation was received by the President of the Dutch Society from the Council and President of the R.H.S. during the progress of the banquet on September 20. The British representatives included Mr. H. V. Taylor, Deputy Controller of Horticulture, Prof. W. Bateson, Miss Pellew, Mr. M. B. Crane and Mr. J. R. Chittenden, from the John Innes Horticultural Institute; Miss E. R. Saunders and Mr. C. Wright, from Cambridge; Mr. R. G. Hatton, from East Malling; Mr. J. Harrison, jun., President of the Chamber of Horticulture; Mr. G. W. Leak (Wisbech), Mr. C. Engelmann (Saffron Walden), Mr. F. G. Tresder (Cardiff), Mr. G. F. Dickson (Newtownards), Mr. Chas. H. Curtis (*Gardeners' Chronicle*), Mr. H. H. Wardle, Mr. J. S. Brunton and Mr. Thos. Want. The countries represented at the Congress were Holland, Belgium, France, Germany, Denmark, Czecho-Slovakia, Sweden, Austria, Finland, Poland, Hungary, Switzerland, Norway, Italy, Brazil, United States of America, India, Australia, Canada, South Africa, Ireland and England.

Some particulars of the exhibition held by the Amsterdam section of the Royal Netherlands Horticultural and Botanical Society are given on page 193, and we hope in subsequent issues to refer further to the conference proceedings.

Presentation to Mr. Robert Anderson.—A deputation representing employees in the Phœnix Park, and other amenities under the Board of Public Works, with which Mr. Anderson has been connected as Superintendent for the past 24 years, with some friends, waited on him at Whitefields, the Park Superintendent's residence, on the 20th inst., to present him and Mrs. Anderson with a handsome silver tea equipment on the occasion of his retirement. The following inscribed address accompanied the testimonial, "Dear Mr. Anderson, in asking you to accept the Silver Tray, Tea Service, etc., on the occasion of retiring from your onerous post as Superintendent of the Phœnix Park, as a small token of the high esteem your regime of twenty-four years has won from us, we, the undersigned employees and friends wish to convey to you and Mrs. Anderson our most earnest and sincere wishes that you may both enjoy health, happiness and every blessing." The address was inscribed with the names of 169 subscribers, and in thanking them through the deputation Mr. Anderson gracefully acknowledged the happy relations and good feeling that have marked his tenure of office.

The Yokohama Nursery Company.—Great anxiety has been felt by those connected with the Yokohama Nursery Co. in this country, which has an agency in Kingsway, London, under the management of Mr. A. Dimmock, as to the fate of the staff and nursery in Japan. We are glad, however, to know that a cable has been received stating that the staff is safe, but that the buildings and stocks, as might be expected, are seriously damaged. The cable also stated that "shipments of bulbs, etc., will be made as soon as navigation opens again."

The late Lady Lambourne.—The many friends of Lord Lambourne will be grieved to learn of the death of Lady Lambourne, which occurred on the 22nd inst., at their Essex residence, Bishop's Hall, Romford. Lady Lambourne's death may be traced to an accident last July, when she slipped and broke her thigh. She was the daughter of the late Sir John Ralph Milbanke-Huskisson, eighth Baronet, formerly of His Majesty's Diplomatic Service. She shared in common her husband's love of flowers and gardening, and was especially fond of Souvenir de la Malmaison Carnations, which are a speciality of the Bishop's Hall Gardens.

Rose Trial Garden at Wisley.—The new Rose trial garden started at Wisley by the Royal Horticultural Society this year has made good progress, and plans for its further development are in hand. The Director will be pleased to send entry forms for new varieties to raisers or introducers on receipt of a postcard stating the number required. The plants (six of each) should reach the Director by November 30.

Forestry and Unemployment.—The Forestry Commissioners state that a limited amount of money has been placed at their disposal as forestry grants for the relief of unemployment. In the case of local authorities a free grant amounting to approximately 60 per cent. of the labour bill will be obtainable for every acre planted. Grants for the preparation of ground for planting and for scrub-clearing will also be available. As regards private individuals, up to £3 may be paid for every acre planted; up to £3 per acre may be paid for land prepared for planting at a later date; and a grant, which may be additional to either of the above, of up to £2 per acre will be available where standing scrub growth has to be removed before planting. The regulations governing the grants are on the same general lines as last winter. Forms of application can be obtained from the Assistant

four bunches of Antirrhinums; J. G. STEWART, Esq., Lasswade (gr. Mr. J. Mackay), for twelve Marigolds (French and African); Lt.-Col. T. G. M'LEAN, Melrose (gr. J. Stewart); Mr. P. F. BAUCHOP, Alexandria, for eighteen vases of hardy cut flowers, and J. DUNCAN, Esq., North Berwick (gr. H. Rutherford), for six blooms of double Begonias.

OPEN CLASSES.

Cut Flowers.—For a display of single and double Chrysanthemums on a table 12 feet by 5 feet, decorated with other plants, etc., Mrs. BOASE, Binrock, Dundee (gr. J. Beats), won the first prize, to which is also attached the Edinburgh Cup for Chrysanthemum cut blooms (to be won three times). The first prize for twelve vases of early-flowering Chrysanthemum cut blooms, disbudded, in not fewer than six varieties, which includes the Scottish Challenge Cup for cut blooms, was won by Mr. C. JENKINS, Cambuslang. Mrs. RUSSELL, Newton Mearns, was placed first for a dinner table, 10 feet by 5 feet, decorated with Roses.

Messrs. G. MAIR AND SONS, Prestwick, gained first honours for twenty-four spikes of Gladioli. In the Rose classes Messrs. H. DICKSON AND SONS, LTD., Belfast, excelled for thirty-six Roses, distinct; Mr. R. C. FERGUSON, Dunfermline, for eighteen Roses, distinct; Messrs. ADAMS AND CARMYLE, Aberdeen, for twelve red or crimson roses; Messrs. D. AND W. CROLL, Dundee, for twelve blooms of any pink Rose; Messrs. T. SMITH AND SONS, Stranraer, for twelve white Roses, and also for six baskets of Roses; Messrs. J. FAIRLEY AND CO., Cairneyhill, Fife, for twelve vases in twelve varieties, and also for six vases of garden or decorative Roses; and Mr. W. FERGUSON, Dunfermline, for twelve vases of garden or decorative Roses.

VEGETABLES.—For a collection of twelve kinds of vegetables Mr. J. GRAY, Uddingston, who had 58 points out of a possible of 76, was placed first, Earl BALFOUR being second, and Mrs. BOASE third. In the single-dish classes Mr. GRAY also excelled for Leeks and long Carrots, and the following were the other winners of the first prizes in these classes:—J. A. HOOD, Esq., Lasswade, for Cucumbers; Mr. R. MASON, Lanark, for Tomatos and Lettuce; Mr. R. A. GRIGOR, Dumfries, for Peas; Earl BALFOUR for French Beans and Cauliflower; Mrs. REID, Lauriston Castle, for Broad Beans, Cabbages, and Celery; Mr. P. LAWRIE, Kirknewton, for Savoys; Mr. N. FORREST, Biggar, for Kale, yellow Turnips and white Turnips; Mr. C. JENKINS for Beet and Parsnips; Mrs. ANDERSON, Auchterarder, for stump-rooted Carrots; Col. HEYWOOD LONSDALE, Shavington Hall, Market Drayton (gr. J. Mills), for Onions (the largest bulbs were approximately eighteen inches in circumference); Mr. DARLING, Edinburgh, for twelve Potatoes; Mr. R. W. E. COWPER, **Gogar House, Midlothian** (gr. R. W. Dingwall), for six Potatos; and J. J. BELL IRVING, Esq., Makerston, for twelve kidney Potatos and also for twelve round Potatos.

The silver cup presented by Messrs. J. W. Scarlett, J.P., and T. A. Scarlett, J.P., for the best exhibit in the vegetable section for collections in the Garden Allotments Federation was awarded for the year to Mr. W. KENNEDY, Liberton (South Craig Association). Mr. KENNEDY also won the silver medal for the best individual exhibit in the section.

NON-COMPETITIVE EXHIBITS.

The following awards were made to trade groups:—

Gold Medals and Special Appreciations.—To Messrs. AUSTIN AND M'ASLAN, Glasgow, for vegetables and flowers; Messrs. DOBBIE AND CO., LTD., Edinburgh, for Dahlias, Roses, Sweet Peas, etc.; Mr. THOS. ROBINSON, Nottingham, for Roses; Messrs. L. R. RUSSELL, LTD., Richmond, for foliage plants, Clematis; etc.; Messrs. STORRIE AND STORRIE, Glencarse, for fruit trees, etc.; Messrs. Sutton and Sons, Reading, for vegetables and cut flowers.

Gold Medals.—To Messrs. JOHN FORBES (HAWICK), LTD., for Antirrhinums, Phloxes, Pentstemons, etc.; Mr. DAVID KING, Murrayfield, Edinburgh, for rock garden.

Silver-Gilt Medals.—To Messrs. CUNNINGHAM, FRASER AND CO., Edinburgh, for herbaceous flowers; Messrs. ISAAC HOUSE AND SON, Westbury-on-Trym, for perennial Scabious; Mr. W. WELLS, Jr., Merstham, for herbaceous flowers.

Silver Medals.—To the CARSE OF GOWRIE NURSERY CO., Errol, for hardy fruit; Messrs. DICKSONS AND CO., Edinburgh, for Roses; Messrs. DOBBIE AND CO., LTD., Edinburgh, for Fuchsias; Mr. JOHN DOWNIE, Edinburgh, for Liliums, Gladioli, etc.; Mr. H. N. ELLISON, West Bromwich, for Ferns; Messrs. LAIRD AND DICKSON, Edinburgh, for Alpines; Messrs. TILLIE, WHYTE AND CO., Edinburgh, for vegetables, etc

Bronze Medals.—Messrs. BAKERS, Codsall, for a model garden and cut flowers; Mr. F. J. BELL, Whitley Bay, for Violas; Mr. W. BUNN, Malvern, for Cactus-flowered Geranium Fascination; Mr. E. J. PARSONS, Worcester, for Worcester Berry, etc.; Mr. LAWRIE, Carnwath, for Begonias.

AWARDS TO NOVELTIES.

First-class Certificate.—Fancy Pansy Mrs. Andrew Frater, exhibited by Mr. ANDREW FRATER, Kirkliston.

Awards of Merit.—Chrysanthemum Alex. A. M'Alpine (Goldfinch × White Masse), exhibited by Mr. ALEX. M'ALPINE, Braidfield, Tolcross, Glasgow; *Chrysanthemum Mary Colvin*, exhibited by Messrs. THYNE AND SON, Dundee; *Chrysanthemum Nellie Webber*, exhibited by Messrs. WEBBER AND SONS, Plymouth; *Collerette Dahlias Betty and Helen*, exhibited by Messrs. TORRANCE AND HOPKINS, Busby; *Collerette Dahlia Gleneagles*, and *Cactus Dahlia Glen Morangie*, exhibited by Messrs. DOBBIE AND CO., LTD., Edinburgh; *Fancy Pansy Dryden M'Coll* and *Viola Helen B. Sutherland*, exhibited by Mr. HUGH M'COLL, Preston House, Linlithgow.

ANSWERS TO CORRESPONDENTS.

CLUB ROOT: *E. E.* Club root may be eradicated from the soil by digging in in the autumn a heavy dressing of quicklime (¾ to 1 lb. per square yard). Lime, bone-meal, steamed bone flower, or basic slag may be used in the same way.

SOIL FOR EXAMINATION: *D. T.* The soil seems to be of a rather harsh nature, but we cannot undertake to analyse it. If you are a Fellow of the Royal Horticultural Society, you may send a sample for analysis to Dr. J. A. Voelcker, R.H.S. Gardens, Wisley, Surrey.

SPRAY FOR GRAPES.—*T. M.* We have no knowledge of the specific you mention, but if, as you state, it was tested at Wisley in 1919, you should write to the director there for particulars.

STEPHANOTIS IN FRUIT: *D. S.* Although the Stephanotis does not fruit freely under cultivation in this country, there are many records of it having done so, and such instances have been referred to from time to time in these columns.

VINE AND PEACH TREE: *F. A. S.* There is no necessity for the expense of building a brick wall. Prune the trees as soon as they are cleared of fruit, and root-prune them in September, or not later than October. It is useless to remove the rank growths without checking the gross roots. Take out a trench in a half-circle in front of each tree, about five feet from the stem, and work to within three feet of the stem and well underneath; remove strong roots pointing downwards and shorten back other gross roots, but take care of all fibrous roots and lay these horizontally from two to four inches below the surface. When filling in add lime rubble and burnt ash, with a good sprinkling of bone meal. Make the border firm as the work proceeds and thoroughly water the soil on two or three occasions. Syringe the trees to prevent flagging, and afford shade for a short time until the roots become active again.

REMARKS.—The general demand has been fairly brisk during the past week, and prices have been steady. English Apples, mainly Worcester Pearmain variety, have been a feature, and although the quantities marketed have been large, their value held firm. At the time of writing prospects point to higher figures being realised. Although Plums have been scanty, there has been a fair quantity of Monarch variety, and prices obtained must have been satisfactory to the growers. Large cookers are not plentiful, and continue in demand. Rather more Apples have arrived from the Continent, as well as from America, and the first consignment from Nova Scotia is due to arrive. Choice fruits such as Grapes, Peaches, Nectarines, Figs and Melons are quoted lower, the demand being slow and supplies heavier. Tomatos have fallen considerably in value, arrivals from all sources being heavy. Cucumbers are not quite such a firm trade. Field Mushrooms are plentiful. Scarlet Runners and Dwarf Beans are both cheaper. A few forced new Potatos from Guernsey as well as some home-grown tubers are on the market, but sales are difficult to arrange at a satisfactory price. Green vegetables are plentiful and cheap. The Potato trade is steady at level rates.

International Horticultural Congress at Amsterdam.

When the President and Council of the Royal Netherlands Horticultural and Botanical Society considered what method they should adopt to mark the jubilee of the society they hit upon the happy idea of celebrating this auspicious event by holding an International Horticultural Congress at Amsterdam, and to combine therewith tours to the principal centres of horticultural interest in the country, together with a few social functions. We understand that the president of the society, Jonkheer G. F. van Tets, was chiefly responsible for the general idea of the Congress, and it was largely due to his genius and geniality that the events followed each other in admirable sequence for a whole week. Jonkheer van Tets is one of the most prominent amateur horticulturists in Holland, consequently his interest in the proceedings and his knowledge of the subjects dealt with, coupled with his ability as a linguist, placed him in the happy position of being able to converse on horticultural and botanical matters with all comers. The Council of the Royal Netherlands Horticultural Society provided a very extensive and attractive programme, and this was carried out in practically every detail over the period commencing on Monday, September 17, and concluding on Sunday, September 23. The chief organiser was Dr. M. J. Sirks, of Wageningen, who acted as Congress secretary, and with whom were associated Jonkheer O. A. W. Repelaer, and Jonkheer C. Dedel. Dr. Sirks has a perfect genius for organisation, and we have nothing but the greatest admiration for his work throughout the Congress. He made arrangements for hotel accommodation for all the foreign guests, and by means of literature and tickets made everything easy for all visitors; he even arranged for the transfer of luggage from Amsterdam to The Hague and from The Hague to Arnhem. The tickets included those admitting the Congress delegates to the Zoological and Botanical Gardens, the Palace, Rembrandt's House, Lees Museum, and the horticultural exhibition. On page 191 we publish the full programme, *pour l'encourager les autres*. Educational interest was always kept in the foreground whether at the four sessions of the Congress or during the tours to Boskoop, Haarlem, Lisse, Aalsmeer, Rotterdam, Deist and Wageningen, but the social interest was not lacking; indeed, delightful hospitality was extended with gracious freedom everywhere, and as the programme was carried out with the amazing accuracy of a first class time table, and devolved no responsibility on the part of delegates—except that of keeping to time—there were ample opportunities for the horticulturists and botanists, representing twenty-two countries, to become acquainted with each other, and this we consider was one of the finest features of the Congress, because scientific, business and social intercourse widens the outlook and tends to produce those friendships which make for the peace, stability and happiness of the world. In the words of the Burgomaster of Amsterdam in his address of welcome, "Reconstruction is the pass word of the present time, restoration of the international relations; restoration also of co-operation between the nations is that which the world needs beyond anything else, and it is this very aim the present Congress has in view to reinforce the existing ties and to enter into new relations by discussing questions of horticulture and botany." Many of the papers read at the Congress and a large number of speeches at the various functions were in English; indeed, the highest compliments possible were paid to the British representatives, including presentation to Her Majesty Queen Wilhelmina at the Huis ten Bosch, The Hague. In these circumstances it was unfortunate that Prof. R. C. Punnet, of Cambridge, and Mr. F. J. Chittenden, of Wisley, were unable to attend and read the papers they had promised, consequently the Royal Horticultural Society was not officially represented. However, a telegram of congratulation was received by the President of the Dutch Society from the Council and President of the R.H.S. during the progress of the banquet on September 20. The British representatives included Mr. H. V. Taylor, Deputy Controller of Horticulture, Prof. W. Bateson, Miss Pellew, Mr. M. B. Crane and Mr. J. R. Chittenden, from the John Innes Horticultural Institute; Miss E. R. Saunders and Mr. C. Wright, from Cambridge; Mr. R. G. Hatton, from East Malling; Mr. J. Harrison, jun., President of the Chamber of Horticulture; Mr. G. W. Leak (Wisbech), Mr. C. Engelmann (Saffron Walden), Mr. F. G. Tresder (Cardiff), Mr. G. F. Dickson (Newtownards), Mr. Chas. H. Curtis (*Gardeners' Chronicle*), Mr. H. H. Wardle, Mr. J. S. Brunton and Mr. Thos. Want. The countries represented at the Congress were Holland, Belgium, France, Germany, Denmark, Czecho-Slovakia, Sweden, Austria, Finland, Poland, Hungary, Switzerland, Norway, Italy, Brazil, United States of America, India, Australia, Canada, South Africa, Ireland and England.

Some particulars of the exhibition held by the Amsterdam section of the Royal Netherlands Horticultural and Botanical Society are given on page 193, and we hope in subsequent issues to refer further to the conference proceedings.

Presentation to Mr. Robert Anderson.—A deputation representing employees in the Phœnix Park, and other amenities under the Board of Public Works, with which Mr. Anderson has been connected as Superintendent for the past 24 years, with some friends, waited on him at Whitefields, the Park Superintendent's residence, on the 20th inst., to present him and Mrs. Anderson with a handsome silver tea equipment on the occasion of his retirement. The following inscribed address accompanied the testimonial, "Dear Mr. Anderson, in asking you to accept the Silver Tray, Tea Service, etc., on the occasion of retiring from your onerous post as Superintendent of the Phœnix Park, as a small token of the high esteem your regime of twenty-four years has won from us, we, the undersigned employees and friends wish to convey to you and Mrs. Anderson our most earnest and sincere wishes that you may both enjoy health, happiness and every blessing." The address was inscribed with the names of 169 subscribers, and in thanking them through the deputation Mr. Anderson gracefully acknowledged the happy relations and good feeling that have marked his tenure of office.

The Yokohama Nursery Company.—Great anxiety has been felt by those connected with the Yokohama Nursery Co. in this country, which has an agency in Kingsway, London, under the management of Mr. A. Dimmock, as to the fate of the staff and nursery in Japan. We are glad, however, to know that a cable has been received stating that the staff is safe, but that the buildings and stocks, as might be expected, are seriously damaged. The cable also stated that "shipments of bulbs, etc., will be made as soon as navigation opens again."

The late Lady Lambourne.—The many friends of Lord Lambourne will be grieved to learn of the death of Lady Lambourne, which occurred on the 22nd inst., at their Essex residence, Bishop's Hall, Romford. Lady Lambourne's death may be traced to an accident last July, when she slipped and broke her thigh. She was the daughter of the late Sir John Ralph Milbanke-Huskisson, eighth Baronet, formerly of His Majesty's Diplomatic Service. She shared in common her husband's love of flowers and gardening, and was especially fond of Souvenir de la Malmaison Carnations, which are a speciality of the Bishop's Hall Gardens.

Rose Trial Garden at Wisley.—The new Rose trial garden started at Wisley by the Royal Horticultural Society this year has made good progress, and plans for its further development are in hand. The Director will be pleased to send entry forms for new varieties to raisers or introducers on receipt of a post-card stating the number required. The plants (six of each) should reach the Director by November 30.

Forestry and Unemployment.—The Forestry Commissioners state that a limited amount of money has been placed at their disposal as forestry grants for the relief of unemployment. In the case of local authorities a free grant amounting to approximately 60 per cent. of the labour bill will be obtainable for every acre planted. Grants for the preparation of ground for planting and for scrub-clearing will also be available. As regards private individuals, up to £3 may be paid for every acre planted; up to £3 per acre may be paid for land prepared for planting at a later date; and a grant, which may be additional to either of the above, of up to £2 per acre will be available where standing scrub growth has to be removed before planting. The regulations governing the grants are on the same general lines as last winter. Forms of application can be obtained from the Assistant

Digitized by Google

Commissioner, Forestry Commission, 1, Whitehall, S.W.1, or from the Assistant Commissioner, Forestry Commission, 25, Drumsheugh Gardens, Edinburgh.

Honour to an American Rosarian.—The Society of American Florists and Ornamental Horticulturists have awarded their medal of honour to Mr. E. Guerney Hill, of Richmond, Indiana, for his work in raising new varieties of Roses. The variety America, which received the R.H.S. Award of Merit on August 21, was raised by Mr. Hill, who has also given us such beautiful Roses as Ophelia and Columbia. *Horticulture*, U.S.A., states that 75 per cent. of the Roses grown in America, including those flowering under glass, were originated by Mr. Hill.

Ken Wood.—It is hoped to add about eight acres of Ken Wood as an addition to the open space purchased through the efforts of the Ken Wood Preservation Council. The land will be handed over by Lord Mansfield in connection with a drainage scheme by which the drainage of the central portion of the estate will be connected with the Hampstead Borough Council's sewer at the Vale of Health. The original scheme was disapproved by the London County Council, but it is now proposed that permission shall be given to lay the sewer under the Heath, subject to conditions to protect the Heath from disfigurement, on the understanding that the belt of the famous woodland up to the sky-line facing Parliament Hill Fields shall be vested in the County Council, in order that it may be preserved as a Nature reserve. The area involved is nearly eight acres in extent, and, if the scheme is carried out, it is likely to facilitate steps for safeguarding the residue of the woodland A further condition is that Lord Mansfield shall waive any right to make roads through Ken Wood and the public open space to Fitzroy Park.

Autumn Fungus Foray.—The twenty-seventh autumn fungus foray arranged by the British Mycological Society commences to-day, Saturday, September 29, at Windsor. Virginia Water will be visited in the morning, and in the evening the annual meeting of the Society will be held at the White Hart Hotel, Windsor. An excursion will be arranged for Sunday afternoon, starting at 2.30. On Monday, October 1, Burnham Beeches will be visited, and in the evening Prof. O. V. Darbishire will deliver his presidential address. Brockhurst Woods and Stoke Common will be the hunting ground on Tuesday, and in the evening Mr. F. T. Brooks will read a paper on "Epidemic Plant Diseases." On the concluding day, Wednesday, October 3, the members will continue the foray in Black Park, Langley, and during the evening will listen to Mr. J. Ramsbottom's account of "An Unpublished Monograph on Discomycetes."

An Old Suburban Nursery Site.—Many of our readers will be sorry to learn that another link with the past is being broken, in the pulling down of the glasshouses, once so well known, of the Stanstead Nursery of Messrs. John Laing and Sons, Forest Hill, where Begonias were so well grown. Houses are to be built on the site, which is already surrounded by residences. The vineries, close by, another branch of this firm, still remain, owned by the busy firm of Furness Bros. At the top of the hill is another well-known range of glasshouses, the seed-growning nursery of Messrs. J. Carter and Co., of Raynes Park, but everywhere in this once busy nursery centre, housing schemes are driving growers farther afield.

Plant Exports to Egypt.—We learn that the Chamber of Horticulture has received information to the effect that the Egyptian Government has prohibited the importation into Egypt of plants when in pots. The reason given is that the Argentine ant may be imported in the soil. Growers whom this prohibition will affect are asked to communicate with the Chamber of Horticulture, 18, Bedford Square, W.C.1, as to whether there is any objection to the order, and if so, to what extent they will be affected.

Mr. J. G. Weston.—Mr. Weston's successes with choice hardy and indoor fruits at numerous exhibitions and his skill in the management of large gardens have earned for him a position of importance in the horticultural world. He commenced his gardening career at Latimer, Lord Chesham's seat in Buckinghamshire, under the late Mr. Alexander Donaldson, who in his day was a noted Grape grower. From Latimer, after a thorough training in all the departments, he went to Hatfield House Gardens, where he spent several years in the cultivation of indoor plants and Orchids under the late Mr. George Norman. His first position as foreman he held under the late Mr. T. Nutting, at Childwickbury, St. Albans, the residence of Sir Blundell Maple, and from thence he obtained the position of general foreman in Lord Rosebery's garden at Mentmore, a position he occupied for three and a half years. He then went to Messrs. Sanders' Orchid Nursery at St. Albans to gain experience among cool Orchids. Mr. Weston subsequently became head gardener to Viscount Duncannon at Bessborough, Co. Kilkenny. Here he proved his skill in no uncertain manner, and was fortunate in that the Viscountess Duncannon was an enthusiastic gardener. The considerable improvements he carried out at Bessborough formed the subject of an illustrated article in the *Gardeners' Chronicle* of May 24, 1904. After eight years at Bessborough he was appointed gardener at Eastwell Park, Ashford, Kent, and here he continued his successful career. An illustrated account of Eastwell Park and its splendid winter garden was given in the *Gardeners' Chronicle* of November 16 and 23, 1907. Mr. Weston is not only a skilful gardener, but he has the power of instructing others in the pleasantest possible manner, consequently he has acted as a horticultural lecturer on very many occasions, and notably during the war period, when he acted as the Royal Horticultural Society's special representative and lecturer in the county of Kent, in connection with the Society's Food Production Campaign. His first experience of writing for the press was in connection with a competition in the *Rural World* for an article on "Strawberry Cultivation." He was successful in winning the prize offered—nearly thirty years ago. He has contributed calendarial and other articles to the *Gardeners' Chronicle* over a long period, and has also written for other horticultural journals. Eastwell Park, unfortunately, as in the case of many other large estates, has fallen from its former high position, and its owner, Lord Gerard, has been compelled to give it up. The house now stands empty, and after the sale of the garden plants and effects in December, 1922, Mr. Weston left the estate, but is still living in Ashford. His services are in great demand as a judge at leading exhibitions in the country, and his services as a lecturer have been engaged by the Kent County Council. As further evidence of Mr. Weston's all-round ability, it may be added that he acted as one of the examiners in horticulture for the Royal Horticultural Society at Wisley this year, and also as examiner of the Swanley Horticultural College in 1922 and 1923. He is also a member of the R.H.S. Fruit and Vegetable Committee.

MR. J. G. WESTON.

National Chrysanthemum Society.—Raisers desirous of placing new Chrysanthemums before the N.C.S. Floral Committee on Monday, October 1, should stage them in the bandstand at Holland Park Rink, and not send them to the R.H.S. Hall, Westminster.

Appointments for the Ensuing Week.—Monday, October 1: National Chrysanthemum Society's Floral Committee meeting. Tuesday, October 2: Royal Horticultural Society's Committees meet at Holland Park Hall (3 days); Sevenoaks Gardeners' Chrysanthemum Society's meeting; Royal Caledonian Horticultural Society's meeting. Wednesday, October 3: Morley and District Paxton Society's meeting; Lewes and District Horticultural Society's meeting. Thursday, October 4: Manchester and North of England Orchid Society's meeting. Saturday, October 6: Blackburn and District Horticultural Society's meeting.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Culture of Nelumbiums.* Walking through the garden of Mr. Van Houtte, at Ghent, last week, my attention was attracted by a large pit, amongst his cold frames, completely filled with Nelumbiums in the most luxuriant state of growth, and exhibiting amongst their leaves many more seed vessels than I could easily count. One bud alone, the last of the season, was about to expand; it was fully six, or perhaps eight, inches high, and I was informed would, when open, be at least ten inches across. The pit differed in nothing from its neighbours but that it had upright glass sides of about three feet, rising upon its brickwork of two feet high, and was formed to receive a glass roof, which was then removed. Mr. Van Houtte informed me that the species was Nelumbium caspicum, and that it was cultivated in summer by sun heat alone, without any assistance from bottom heat whatever; but that the roots were preserved in a hothouse in winter when dormant. The pit stands exposed to the utmost possible amount of light, and could be compared to nothing but a broad ditch glazed on both sides and completely overgrown with Nelumbiums. Its appearance was so remarkable that I cannot but wish such a pit might be devoted to them, either at Chiswick or Kew, where they could hardly fail to attract much attention. Mr. Van Houtte has found Nelumbium caspicum much easier to cultivate than N. speciosum, and much more ready to flower than N. luteum; of its prolificness in this respect there was abundant evidence. The seed vessels exhibited all their peculiarity of form, but the seeds did not appear as if they would ripen, indeed they were evidently abortive. Some years ago I found that N. speciosum grew much stronger in a pit close shut up and exposed to sun heat than I ever obtained it in a stove. But the plant having been accidentally destroyed in winter I had no opportunity of carrying on my experiment. Intense light is, I believe essential to its growth. *J. R., September* 10. *Gard. Chron., September* 23, 1848.

TREES AND SHRUBS.

THE CLIMBING HONEYSUCKLES.

THE word Honeysuckle always suggests fragrance, for there are no flowers quite so sweet, or more charming among hardy climbers. In number of species the bush Honeysuckles outnumber those of twining habit, though comparatively few of these are deserving of general planting in gardens. With the climbing species it is quite the opposite, their fragrance and beauty claiming hosts of admirers. The hardy climbing Honeysuckles are found in three continents, Europe, Asia and America. Taking the European species first, the most important is L. Periclymenum. In addition to being a native of Britain, it is a wild plant of northern Europe and extending into Asia. The wild form, with reddish buds and yellowish-white flowers, is well worthy of a place in gardens, but it is not much grown, being surpassed in beauty by several cultivated varieties. The best known of these is the variety belgica (Fig. 67), the Dutch Honeysuckle. It has purplish stems and purplish-red buds; the open flowers are yellow within. The variety serotina is popularly known in nurseries as the Late Dutch Honeysuckle, no doubt because it continues flowering late in the season. This has rich purple flower buds, the outside of the flowers when open contrasting pleasingly with the creamy-white interiors, which change to yellow with age. The variety quercina, or quercifolia, has, as the name suggests, leaves resembling those of the Oak.

L. Caprifolium is another European species. It is readily distinguished from L. Periclymenum by the uppermost pairs of leaves, which are united. It is a vigorous climber, deciduous, producing in June and July whorls of fragrant flowers that are yellowish-white tinged with pink. This Honeysuckle, or a form of it, is the one usually sold in nurseries as Early Dutch or Early Cream.

L. etrusca, the Italian Honeysuckle, is a native of the Mediterranean region, and requires the shelter of a warm wall, except in the favoured climate of the south and west. For large, cool and unheated greenhouses it may be described as an indispensable climber, producing long branching growths wreathed with pale yellow blossoms that are more or less suffused with red, especially at first, in late summer and autumn. The variety superba is an even more desirable form, and is the plant generally grown in preference to the type.

The best known of the Chinese and Japanese species is L. japonica and its varieties, which, being evergreen, are readily distinguished from the deciduous L. Periclymenum. It is of very vigorous and free growing habit, producing quantities of blossoms from June onwards. There are two distinct forms or varieties; the one known as flexuosa has creamy-white flowers, more or less tinted with red, whilst the var. Halliana has creamy-white blossoms changing with age to yellow. The variegated variety aureo-reticulata, with the leaves mottled and veined with yellow, is a very ornamental climber.

L. tragophylla is a Chinese Honeysuckle of free and rampant growth. This species is not very hardy, hence it should be planted against a sheltered wall or fence with plenty of space to ramble. It will then produce freely its long tubular yellow blossoms of the largest size.

L. Henryi is a vigorous evergreen Honeysuckle, first introduced by Mr. E. H. Wilson, from China, in 1908. It has purplish-red flowers, produced about midsummer, followed in autumn by purplish black fruits, which have a certain decorative value.

Among the climbing American species the most valuable is L. sempervirens. This is, however, a native of the south-eastern United States, and except in the mild climate of the south and west, should be grown in a greenhouse. The variety minor, with scarlet and yellow blossoms, is a particularly desirable climber for the greenhouse, being seldom without flowers.

The cultivation of Honeysuckles is simple; they thrive in most soils, with a preference for one which is on the light side, but rich and deeply cultivated. Select sunny positions for preference.

Their value to clothe walls, fences, arbours, arches and verandahs is too well known to need discussion. If it is intended to train Honeysuckles over trees, do not make the mistake of planting them near the tree trunks. Make the holes, and prepare the stations for planting out near the spread of the branches, where rain will reach the ground, supporting the growths with stout poles of good length till they reach the lower branches.

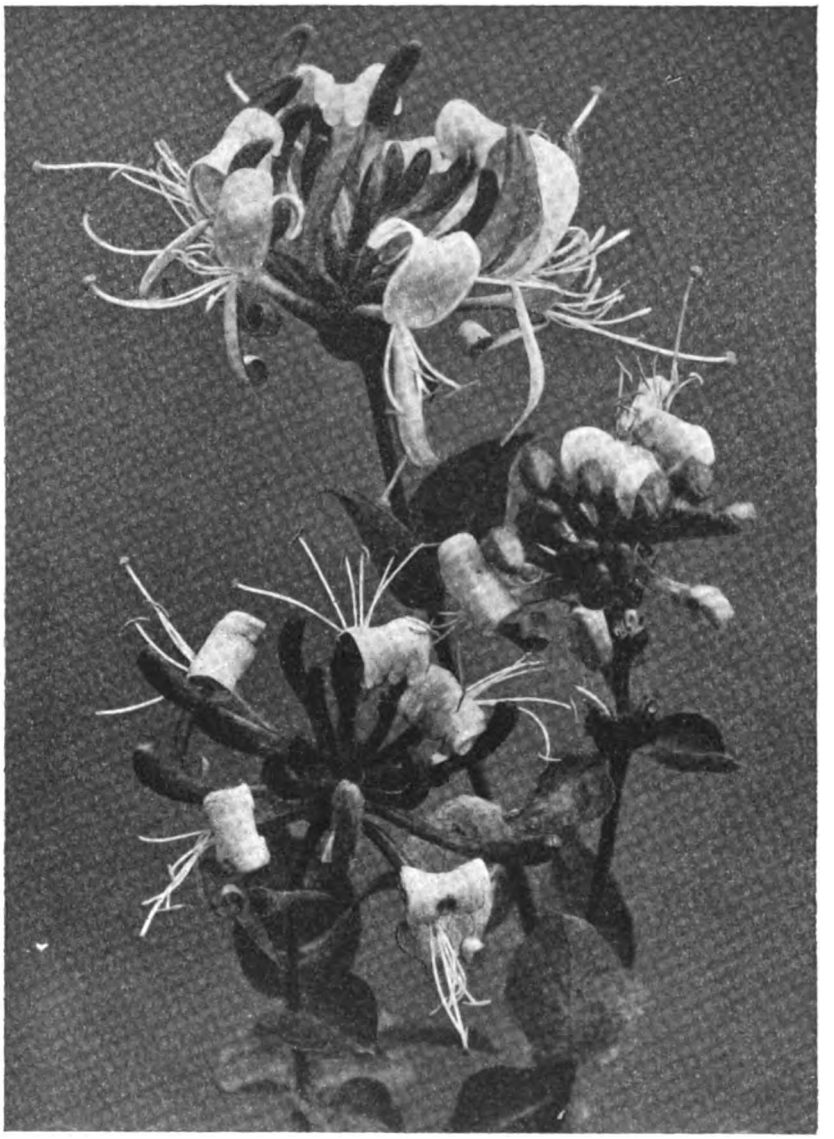

FIG. 67.—LONICERA PERICLYMENUM VAR. BELGICA : THE DUTCH HONEYSUCKLE.

Some attention must be given to thinning and pruning the shoots in early spring each year, otherwise the plants in time may become a tangled mass of growths. *A. O.*

PHYGELIUS CAPENSIS.

THOUGH a native of South Africa, the Cape Figwort—by which name P. capensis is familiarly known—is a shrub that will often thrive in localities where the planting of most half-hardy plants would be considered too risky. It does well near London, also at Kew, in parts of Scotland and throughout our westerly counties. Even when cut to the ground by frost it will frequently recover with extraordinary vigour and possibly flower the following summer.

P. capensis is allied to the Pentstemons, and in favoured places will make a loose-habited shrub up to 4—5 ft. in height. The opposite, ovate leaves vary considerably in length and width, and the flower spikes, which appear at the ends of the branches, may be anything from a few inches to 18 in. in length. These latter bear a profusion of bright scarlet tubular flowers, and as a succession will not infrequently be maintained from summer well into autumn this subject must be considered a valuable one where a late display of bold colour is desired. P. capensis enjoys a rich soil, but it is not usually fastidious, and although a good drought-resister, I find that it likes plenty of moisture during the growing season. *A. T. J.*

CERCIDOPHYLLUM JAPONICUM.

THIS is a rare, Japanese, deciduous shrub, and should be included in every collection, however limited in numbers. The plant grows in very symmetrical shape and the wood is fine and twiggy, but its great beauty lies in the small, heart-shaped leaves. These are a lovely soft green tinged with red, and almost transparent, in the spring. In the summer the foliage thickens in texture and the colour deepens, whilst towards autumn the leaves turn a lovely dark red, which lasts until frost comes or they drop naturally. Even in winter this Cercidophyllum is an attractive shrub, as its fine growth gives it a light, graceful appearance. It grows from 4 to 10 feet high or even more in a very suitable position. It does best in a warm, sunny spot where the wood gets well ripened and where there is little danger of the delicate leaves being injured by late spring frosts. *T.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Gardener to His Grace the DUKE OF MARLBOROUGH, K.G., Blenheim Palace, Woodstock, Oxon.

Masdevallia.—The usual precautions against applying too much water to newly-potted plants until the new roots have freely entered the fresh compost are applicable in the case of Masdevallias. The smaller growing Masdevallias, both species and hybrids, comprise some interesting and beautiful plants, and as they require somewhat different treatment, they must not be classed with the more robust members of the genus. Too many failures with these plants may be traced to an excess of water at the roots, during the winter, and not sufficient air and moisture during the hot days of summer. No Orchid should have water applied to it in driblets, but should be watered copiously when it is dry, and then left until it becomes dry again.

General Remarks.—The season has arrived when attention must be given to the safe keeping of the plants through the winter. The most important detail to observe at this season is to maintain a proper balance of temperature, neither too hot nor too cold, with sufficient atmospheric moisture and air to prevent a stuffy condition in any of the houses. Localities differ as regards humidity, and even the position and structure of the houses must be taken into consideration, as these affect the general results. Sunshine should be allowed to reach the different plants according to their capacity of withstanding it. At one time it was considered good policy to withhold water from the plants over an extended period; in some cases this is beneficial and conducive to satisfactory growth and the production of flowers, but only in the case of certain species. In the majority of cases this treatment is too drastically followed, so that the plants shrivel and suffer; therefore care is necessary in the application and withholding of water to plants at this season. Ripening and consolidation of the growths can be effected without great fluctuations in temperature, and the effect of either extreme is injurious and should be avoided. Shading at this season can now almost be dispensed with; only newly potted plants, or those with thin, tender foliage will need it. At this season it is desirable to expose Orchids to as much light as possible, and give sufficient ventilation to prevent the sun scorching the foliage. This treatment consolidates, hardens and matures the pseudo-bulbs and growths, thus enabling the plants to pass through the winter without injury. Plants treated in this manner start into growth with much more vigour in the spring, produce finer growths, and with stronger growth proportionally finer flowers.

THE KITCHEN GARDEN.

By R. W. THATCHER, Gardener to MARK FIRTH, Esq., Carlton Park, Market Harborough, Leicestershire.

Spring Cabbage.—The main batch of this useful vegetable may now be planted, and there is no better site than an Onion bed from which the bulbs have been lifted. Not only will the soil be firm, but it is usually in good heart, and this combination will produce a fine crop with less tendency of the plants to bolt than if they were planted in light, loose soil. Plant in rows made eighteen inches apart, and allow a space of one foot between each plant in the rows. In the early spring draw every other Cabbage out, and make good any gaps there may be in the rows with these. Water the plants well and stir the ground on frequent occasions with the Dutch hoe.

Tomatos.—Remove some of the foliage from Tomato plants growing under glass and gather the fruits as fast as they become ripe. Do not overfeed the roots at this stage; instead of concentrated fertilisers, rather give them a top-dressing of soot and wood ash. This will cause the fruits to colour well and provide potash which these plants need. Also water only when moisture is needed, as over-watering is a cause of the fruit cracking; a little fire heat would be an advantage on wet, dull days. A pinch of seed may be sown to raise plants for early fruiting next spring, placing the seed pots in a warm house, and removing them to a shelf as soon as the seedlings appear. Best of All is a splendid variety for this purpose.

Mushrooms.—The Mushroom house should be cleansed thoroughly and the walls lime-washed. Fresh beds may then be made of horse droppings and short stable litter turned over several times until the required quality is obtained. When all the material is ready, wheel it into the house and spread it evenly and firmly, allowing it to remain until the heat has declined somewhat. Directions for spawning the beds were given in the Calendar for February 3.

Onions.—The main crops of this vegetable should be lifted carefully with a fork, and the bulbs laid out to dry thoroughly. If room is available in an open shed or a cold fruit house they may be dried indoors, as their keeping qualities are much impaired if they are not ripened properly. Large bulbs require to be lifted with extra care, taking every precaution not to bruise them. Lift these also with a fork and lay them on a dry, sunny border, and turn them over every day. Cover them at night with waterproof sheets, and when the tops have died down cut them off and remove the bulbs to the stage in a fruit house, placing them carefully on wood wool, or other soft material, where they will ripen perfectly.

Spinach.—Make a last sowing of this vegetable on a warm border, and thin the seedlings as soon as they are large enough to handle. Dust the plants with old soot and keep the soil hoed, working between the rows of this and the previously sown crops of Spinach.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to J. A. BERNERS, Esq., Woolverstone Park Gardens, Ipswich.

Cucumbers.—Cucumbers growing in frames should have plenty of nourishment. Thin old and exhausted shoots and remove old leaves that are infested with red spider. New growths should be encouraged to develop for another month by top-dressing the roots with good loam and lime rubble. Thoroughly syringe the plants and close the frame early in the day. If artificial heat is available the plants will continue productive until the next batch comes into bearing. Plants intended for winter bearing should be set out early in the present month. The house or span-pit utilised for the purpose should be cleansed, including the glass both inside and outside. Syringe all walls and crevices with paraffin and water, whitewash the walls, and paint the woodwork if necessary. The compost should be prepared and turned over a few times before bringing it into the house. The compost should consist of loam free from wireworm, manure from a spent Mushroom bed, and old plaster rubble. The soil should be placed on a bed of fermenting material, either in the form of a ridge, or hillocks. Young and vigorous plants only should be chosen, and they should not be allowed to bear fruit until they are well established and have made good growth.

Peaches and Nectarines.—For planting in newly-erected houses the selection of varieties should be governed by the number of houses which may be started to maintain a continuous supply. If the number of houses is limited it is not advisable to plant too many of the earliest varieties in the early division; a selection of early, medium, or late varieties may be planted to continue the supply until the fruits in the successional house are ready to gather. The following Peaches and Nectarines are good forcing varieties and suitable for furnishing a succession of fruits:—Peaches: Duke of York, Hale's Early, Peregrine, Crimson Galande, Dymond and Bellegarde. Nectarines: Early Rivers, Lord Napier, Dryden, Stanwick Elruge, River's Orange, Humboldt, Pineapple, and Spenser. For a late house the following Peaches and Nectarines would provide a succession to the varieties above mentioned:—Peaches: Late Devonian, Barrington, and Princess of Wales. Nectarines: Milton and Victoria. If space permits some of the more recent introductions may be included with the older varieties. James Walker, Kestrel and Amsden June and Waterloo are also fine early Peaches, but the two last are liable to drop their buds when forced early. They both succeed much better if started slowly in February, or, better still, in March. Cardinal is a very fine early Nectarine, but is best grown in pots.

HARDY FRUIT GARDEN.

By A. J. HARTLESS, Gardener to Major J. F. HARRISON, King's Walden Bury, Hitchin, Hertfordshire.

Apples.—Early varieties of Apples will now be ripening, and it may be necessary to gather soft-fleshed varieties, such as Ecklinville Seedling, early to obviate loss by birds. Other varieties, such as Worcester Pearmain, James Grieve, Irish Peach, and Lady Sudeley, may be gathered when they are ready. Our orchard trees of Bramley's Seedling are carrying heavy crops, in spite of recent wind storms which were responsible for many fallen fruits. It may be necessary to net choice fruits where it is possible to do so. White Transparent is an Apple which seems restricted to certain localities. It is useful either as a dessert or culinary Apple; it is one of the first of the season, a regular cropper, and does well on poor soil. The fruits should, however, be eaten soon after gathering, or the flavour may deteriorate. Although the variety Dumelow's Seedling, better known to some as Wellington, is one of the best cooking Apples for market, I find, like most growers, that the trees are very much subject to canker.

Nectarines.—The old variety, Elruge, is a very useful sort, being suitable for most situations. Humboldt follows in early September, and is succeeded by Pineapple, a variety which perhaps is not very hardy in some districts, but is of excellent flavour. The two last are yellow-fleshed varieties, and sought after when available.

Peaches.—For earliness, Hale's Early, Early Rivers and Duke of York are three good varieties, followed by Peregrine, Dymond and Violette Hâtive. The varieties Prince of Wales, Sea Eagle and Albatross are suitable as late sorts.

General Remarks.—The weather of the past few weeks has enabled fruit growers to destroy weeds in large areas. It may yet be possible to give the land another hoeing during the next month, to kill seedling weeds, which often make an appearance during the early autumn. Any arrears of summer pruning should be completed. Old orchard trees may be dealt with where crops allow. Surplus branches and dead wood should be removed. Any work which can be possibly done now will ease the labour at planting time. Fruit trays should be got in readiness, and repairs completed to necessary structures.

PLANTS UNDER GLASS.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Oxalis purpurata (syn. O. Bowiei) and O. cernua.—The former is one of the largest flowered species, and a very beautiful plant for the greenhouse. It succeeds under similar treatment to that advised for O. floribunda. O. cernua is another pretty South African species, with yellow flowers, also useful for the greenhouse.

Pentapterygium serpens.—This beautiful and graceful greenhouse shrub is worthy of more general cultivation, as it produces its flowers in great profusion on the slender drooping shoots. It makes a fine specimen when grown in large pans, or planted out in a shallow bed with perfect drainage. It is an ideal plant for training on a back wall, where it will attain a height of 10 to 12 feet. It forms a large, swollen tuberous-like root-stock, which in this class of plant generally indicates a need for perfect drainage; in its native state it often grows in the forks of trees among decaying vegetable matter. The potting compost should consist of

Digitized by Google

good fibrous peat with a little light loam, charcoal, and sand to render the mixture open and porous. The plant is easily propagated by means of cuttings inserted in pots of sandy peat and stood under a bell-glass in a cool house. They may be rooted at this season, or any time during spring and summer.

Chrysanthemums.—Early flowering varieties should now be taken indoors, as forward buds are apt to suffer from damp. The house should be kept fairly moist for a few days, as the plants are apt to suffer from the drier atmosphere; this applies to most plants that have stood out-of-doors for the summer months, and later been placed under glass.

Pycnostachys Dawei.—The main batch of this fine, blue, winter-flowering plant should now be in their flowering pots; the plants will be useful for standing in the conservatory beds. If cuttings are rooted this month, and pinched twice, they will make good specimens for furnishing the plant stages.

Coleus thyrsoideus.—This is another choice blue-flowered plant for winter, and may be given the same treatment as Pycnostachys, but it is by no means such an easy plant to cultivate successfully, and care is always necessary as regards ventilation and watering; but it is a subject that is worth some extra trouble to grow successfully.

Fuchsias.—If a few stock plants are partly cut back and placed in a warm house, they will soon develop shoots suitable for use as cuttings, which, if rooted during this month, and kept growing steadily during the winter, should, in six to nine months, make plants—according to the variety—some six to nine feet in height. The leading shoot should be grown without stopping, as the plants will develop lateral shoots, which should be pinched several times to ensure well-furnished specimens. Such plants, if fed freely, will remain in flower for a long time, and are invaluable for conservatory decoration during the summer and autumn.

THE FLOWER GARDEN.

By O. TURNER, Gardener to EMILY, LADY AMPTHILL, Ampthill Park, Ampthill, Bedfordshire.

Late Cuttings.—It is not wise to defer the taking of cuttings after this date, even of those hardier kinds usually left until last. Among such to be dealt with here are Agathaea coelestis, Calceolaria amplexicaulis, and a few Golden Gem Calceolarias, hardy Fuchsias, and Verbena venosa. All these will succeed in cold frames from which frost is excluded. Respecting the Verbena, although its unflowered tops will strike, it is far more satisfactory to propagate from its underground stems, which work can be done later when taking up the old roots to winter them in a frame. Cuttings of Salvia Pride of Zurich and S. patens may also be dealt with, if not yet inserted and the plants are still unfrosted. Violas were referred to in an earlier issue, but in some gardens the propagation of these flowers is left until the end of September. Another good plant worth remembering is Nepeta Mussinii, cuttings of which may be rooted under conditions as for Violas, or division of the roots may be resorted to if such plan will yield sufficient plants.

Special Plants.—Although there is always a natural reluctance to dismantle the flower garden, no undue risk should be taken with choice or special subjects, such as specimen Zonal Pelargoniums in tubs, or plants grown as standards, both productions taking more than ordinary time and care to replace if damaged.

Leycesteria formosa.—Where not already grown, a note should be made of this plant—the Nutmeg Shrub—for inclusion in this autumn's planting. It flowers early in September, and although not strictly showy, the plant is of much charm, while the late appearance of the flowers is so valuable because few other shrubs are in blossom now. The small white flowers are accompanied by numerous rosy-purple bracts, which add to their attractive appearance. The pruning of this plant should be done in spring.

PUBLIC PARKS AND GARDENS.

THE ultimate development of the site of the Aquarium at Brighton, which has been a subject of discussion by the local authorities for over a year, is still uncertain. The committee dealing with the matter is now considering a scheme submitted by the parks superintendent providing for a widening of the road and the conversion of the remainder of the site into "Italian" gardens, while the underground portion would be turned into a dance hall.

The City of Glasgow has purchased the Bankhead and other estates, comprising nearly six hundred acres, in connection with a town planning scheme. The majority of the land will be used for building purposes in connection with housing schemes contemplated by the Corporation, but a very considerable portion is to be reserved as a public park. The proposed park will have an area of about one hundred and seventy acres.

FIG. 68.—GENTIANA FARRERI IN A PERTHSHIRE GARDEN.

THE ALPINE GARDEN.

GENTIANA FARRERI.

I ENCLOSE a photograph (see Fig. 68) showing Gentiana Farreri growing in my garden at Glendevon, Perthshire. The Lilium growing with the Gentian is L. philippinense var formosanum. The Gentians were raised from seed three years ago, and you will see the plants have made good growth. I think one reason some people have difficulty in growing G. Farreri is that their plants have been raised from cuttings. Such plants are not nearly so healthy as those raised from seed. My plants ripen seed every year which, if sown in the spring will produce seedlings for planting out in July, to flower the following year. *A. H.*

CAMPANULA PUMILA PERRY'S PIGMY.

THIS is a diminutive form of Campanula pumila, growing only 3 inches high, with numerous small, bell-shaped flowers of a pretty soft blue shade. The plant is suitable for placing on a sunny rockery, and if put in masses soon forms a complete carpet, and is generally most effective in appearance. This miniature Campanula delights in sandy soil and a partially shaded situation. *W.*

HARDY FLOWER BORDER.

HEUCHERA.

THE Heucheras, which are known commonly as Alum Root or Coral Buds, are desirable rockery and border perennials of neat, compact and bushy habit, and of vigorous constitution, growing from 2 feet to 3 feet high. The plants form dense mounds of evergreen, leathery, green foliage during the summer, which assume towards autumn pretty tints much resembling the leaves of Galax aphylla. The plants are exceedingly ornamental subjects for many situations, and they flower from June to August and September. From the dense tufts of foliage arise numerous wiry, graceful, leafless flower stalks, carrying blooms of unusually effective tints of coral pink to coral scarlet, shades of rose to blood red, also pure white. The inflorescences are invaluable either as cut flowers or for effect in the rockery or to adorn the flower borders.

All the Heucheras are perfectly hardy and succeed admirably in well-drained, deeply-trenched, light soil, and in a sunny position. The following comprise some of the best species and varieties:—H. brizoides gracillima, with branching panicles of rich, rose-crimson flowers; 2 feet. H. b. gracillima alba, a variety with small, rosy white flowers, 2 feet. H. b. gracillima Perry's variety, a greatly improved form of the type, with flowers of a more brilliant crimson, arranged in loosely branching, elegant panicles, 2 ft. H. micrantha rosea, a plant with tall, branching, wiry stems, 2½ feet tall, covered with small, rose coloured flowers. H. sanguinea Pluie de Feu, a very free-flowering plant and remarkably effective, having graceful sprays of brilliant fiery-red flowers, 1½ to 2 feet. H. sanguinea splendens, with flowers of a rich coral scarlet, and very freely produced; 2 feet. H. sanguinea White Empress, a pretty white-flowered variety of neat dwarf habit; 1½ feet. H. Richardsonii, a handsome plant for any open situation, having large, bronzy, satin-like leaves, and quite as effective in winter as in the summer, on account of the lustrous dark crimson shade of the leaves. This plant is grown more for its foliage than the flowers, which are of a pale brownish colour. H. Rosamunde, a most effective and useful variety either for effect in the borders or for cutting. It bears numerous flower spikes with wiry stems, 2½ to 3 feet tall. The flowers are coloured coral pink. H. tiarelloides is a very pretty and useful hybrid for spring flowering, having neat tufts of bright green foliage, and clear, rosy-white coloured flowers.

PHYSOSTEGIA.

THIS is a hardy herbaceous plant of perennial duration, and remarkably interesting on account of the peculiar sensitiveness of its flowers, which may at will be placed in almost any position by a move of the fingers at right angles, and will remain where placed for some short time. It was introduced during the 17th century, and is a native of North America. When exhibited at a recent meeting of the Royal Horticultural Society it was described as the "Obedient Flower," and created a large amount of interest and something of a sensation on account of this peculiar sensitiveness of the flowers.

The Physostegias are of the easiest culture, delighting in any moderately rich soil, and may be planted with good effect in almost any sunny position, producing numerous, well-branched, stout spikes of pretty, tubular flowers in clustered racemes, and arranged in the four directions of the compass.

The varieties are well worth growing, and merit the best positions in the flower border, being especially effective when planted in groups of three, six or nine in a clump, from July to September. P. virginiana has bright pink, tubular flowers, and grows 3 feet to 4 feet tall. P. v. album has snow-white flowers, and grows only 2 feet tall. P. v. imbricatum (syn. speciosa) is more vigorous than the preceding, producing delicate rose-pink, tubular flowers, on stout stems, 4 feet to 5 feet tall. *W. L.*

ORCHID NOTES AND GLEANINGS.

DISAS.

(*Concluded from p.* 147.)

If proof is wanted of the alertness of Orchid hybridists it may be found in the hybrid Disas, for scarcely had the two new arrivals, D. racemosa and D. tripetaloides, appeared in our gardens when they were freely used by crossing between themselves and with D. grandiflora. The facility with which hybrids were raised and the surprisingly quick time in which the seedlings developed into flowering plants gave an incentive to raising seedling Disas, both species and hybrids. From eighteen to twenty months from the date of sowing to flowering is the average time recorded for hybrid Disas. The seed ovaries mature quickly, and if the seeds are sown as soon as they mature the seedlings appear quickly and are soon ready for planting in store pans from which they should be removed and potted singly when large enough.

Disa Veitchii, the first hybrid Disa, was raised by Mr. Seden in the nurseries of Messrs. Jas. Veitch and Sons by crossing D. racemosa with the pollen of D. grandiflora. The first plant flowered in a little over twenty months from the sowing of the seed, and secured a First-Class Certificate at the Royal Horticultural Society's meeting in June, 1891. It is intermediate in size and more nearly approaches D. racemosa in form and colour, the hooded dorsal sepal, or galea, being almost circular in outline, light in colour and with a few rose markings; the showy lateral sepals are purplish rose. The same cross was raised at Kew and in the nurseries of Messrs. Backhouse at York. Disa kewensis was raised by Mr. Watson at Kew, the cross being D. grandiflora with the pollen of D. tripetaloides, the latter parent giving the form of the flower in a great degree. In colour it is rose-pink, lighter on the dorsal sepal, which has purple spotting derived from the pollen parent. The plant flowered in eighteen months from the sowing of the seed.

Disa Premier was first raised at Kew by crossing D. tripetaloides with D. Veitchii, thus continuing all the three species of the section It obtained a First-Class Certificate at the Royal Horticultural Society's meeting on October 10, 1893. The cross has been made both ways, and whilst some variation is seen in the flowers, all approach nearest to D. racemosa.

Disa langleyensis is a most interesting hybrid, combining the two newcomers, D. racemosa and D. tripetaloides. It was first flowered by Messrs. Jas. Veitch and Sons, who obtained an Award of Merit for it in May, 1894. The cross had also been raised at Kew and each of the parents had been used as seed-bearer. The result was, as usual, that the colour and size of D. racemosa predominated, although some of the seedlings opened nearly white, but assumed the light mauve tint when mature, and the light forms showed some of the spotting of D. tripetaloides.

Disa Diores variety Clio obtained an Award of Merit on August 23, 1898, and a First-Class Certificate on July 25, 1899, when shown by the raisers, Messrs. Jas. Veitch and Sons, who obtained it by crossing D. Veitchii with D grandiflora. It was at that time the largest of the hybrid Disas, with more of the red of D. grandiflora, but with a rounder dorsal sepal than that species.

Disa Luna, raised by Messrs. Veitch between D. racemosa and D. Veitchii (A.M., May 6, 1902), is a very free grower with bright mauve, lateral sepals and white or rose galea marked with purple on the inside. Messrs. Flory and Black, on taking over the Veitchian Orchid establishment at Langley, continued the work of raising these pretty hybrids, always striving for improved size and colour, and with good results

Disa Blackii, between D. grandiflora and D. Luna, was a good advance in 1915, well improved on in D. Italia (Blackii × grandiflora) in 1918, and recently in their showy D. Julia A. Stuckey (Italia × grandiflora), which, while closely approaching D. grandiflora in size, is of a reddish-crimson colour.

Other less known hybrid Disas are D. Elwesii (kewensis × Veitchii) and D. Watsonii (grandiflora × kewensis), raised at Kew; and the variety Stella.

Few plants have been subjected to such a variety of treatment as the Disas of the D. grandiflora section, and if we take that species as a guide it will be found that those who grow their Disas as greenhouse plants, and for a good period in the open garden after flowering, get the best results, while those who neglect the open-air treatment until it is prudent to give greenhouse shelter at the end of the summer and treat them as Orchid house subjects, fail. From the time the flower spikes commence until they are opening the flowers a cool, airy Orchid house is beneficial, but after flowering they require the open-air until frosts set in.

To recall some of the most successful growers of Disa grandiflora, I think of the stout brilliantly flowered specimens I have seen at the pretty homestead of the late Mr. Daniel Hill at Harrow, who grew his plants as open-air and cold greenhouse subjects, and they gave him one of his best gardening pleasures. The late Mr. Kingsmill at Stanmore had some of the finest D. grandiflora to be seen. His treatment was to grow them in the open-air and later in a cold frame protected from frost. The late Mr. Smee at Wallington treated them as garden plants except in winter, and most successful cultivators, including Mr. W. P. Burkinshaw, of Hessle, who grew D. grandiflora in quantity, followed on the same lines. Messrs. Backhouse, of York, had great success by planting them in a bed with a bottom of clinkers on the staging, the house being cool, but the ventilators were arranged to have the Disas practically in the open-air after flowering, and at other times when not too cold.

In the matter of hybrid Disas there is a tendency to give too much heat. The seedlings develop rapidly in a genial temperature, and until they flower it is right to afford warmth, but the mistake comes from continuing the warm treatment too long, and the result is that the root stock degenerates and the plants are lost. The hybrids should have the open-air change, as well as the species. The collapse of hybrids in many places comes, in some degree, in consequence of unsuitable material used for potting them. In some places Disas are grown in compost containing leaf-mould, or decayed leaves, a treatment which has proved disastrous with other genera of Orchids. Fibrous peat mixed with Sphagnum-moss and a sprinkling of sharp sand or grit, with a few pieces of charcoal or sandstone worked in during the potting, are the best rooting materials, and variations in the proportions of the ingredients are customary with different successful growers. A little loam fibre may be added. Free drainage and plenty of rain water where available are essential. Some growers use a proportion of manure, but it is better not to mix manure with the rooting material, although a little weak liquid prepared from cow dung may be beneficial to the plants during their period of active growth. Disas should not be dried off. *James O'Brien.*

INDOOR PLANTS.

MIMULUS CARDINALIS.

For the decoration of the cool greenhouse during the summer this old hardy perennial is usually treated as an annual, the seed being sown in gentle heat early in the year. Seedlings commence to flower in June, and, although individual plants flower satisfactorily in six-inch pots, a much finer effect is produced by growing three plants together and flowering them in eight-inch pots, using, for the final potting, a compost of two parts loam, one part leaf-soil, and one part well-rotted manure, with sand added.

Mimulus cardinalis responds to liberal treatment, and, when well grown, is from 2 feet to 3 feet high. The flowers are bright red in colour, with darker lines radiating from the centre, and they are elegantly poised on long peduncles, while the reflexed central lobes give the flowers an appearance distinct from other Mimulus. *Fred W Jeffery, Dalserf, N.B.*

NATSOPA CONVALESCENT HOME AND ITS GARDENS.

Natsopa, a word one may look for in vain in the dictionary, is, nevertheless, a word of weighty meaning and vast importance to thousands upon thousands of British workmen. It is the condensed title of the National Society of Operative Printers and Assistants. Let those who will raise argument over the merits or shortcomings of Trade Unionism; I am content to have made acquaintance with an establishment, the very existence of which proves that, at any rate, the Operative Printers and Assistants have other and nobler concerns in mind than strikes and disputes, for among their activities and achievements none can be finer than the establishment and maintenance of the Natsopa Convalescent Home as a memorial to 341 of their comrades who fell in the War.

Situated in an open and glorious spot just outside the quaint little township of Market Bosworth, Leicestershire, the Home stands high midst a bracing and health-giving air, overlooking a vast stretch of lovely country, the glory of the panoramic view alone being calculated to refresh and invigorate the weak and jaded, to whom the portals of the Home are wide open.

It is of the remarkable gardens surrounding Natsopa Convalescent Home I wish to write, and in several respects they justify the adjective remarkable. The gardens are new—in fact, in their infancy, as age in gardens must be reckoned, for their creation only dates back to February, 1920, and it was in May of the same year that the Home was opened by the late Lord Northcliffe, who in the largeness of his heart appreciated the value and nobility of the scheme of the Operative Printers.

When the site was taken over, it was just a tract of rough, unkempt hillside, and when one contemplates its beautifully verdant lawns and level terraces, the gracefully sweeping drive girt on either side by herbaceous borders aglow with brilliant colours, and the gay ramblers and beds of fragrant Roses, the transformation appeared even more remarkable to the horticulturist who knows what such work means than to the uninitiated who nevertheless admire.

Starting with the herbaceous borders, one is delighted with great masses of golden Heleniums and Solidagos, vivid Pentstemons in colonies, and a host of other choice perennials, to name the whole of which would be to compile a comprehensive catalogue. Ere one has completed a survey of the borders, he is constrained to journey a little farther, for the Northcliffe Memorial garden commands attention and is forcible in its appeal. It was but natural that the members of the Natsopa should erect a memorial to Lord Northcliffe, and the Northcliffe garden is as appropriate as it is beautiful in its conception The monument is a massive pillar of hewn granite, the approach being by means of stone-paved pathways forming a memorial cross, while the garden is composed of beds of beautiful Roses distributed over a wide circle of fine verdant turf. The whole is surrounded by massive pillars of rustic timber, up which Rambler and Wichuraiana Roses already climb with vigour and bloom with freedom, although the garden is entirely the work of this year, and the monument was unveiled on the last day of March.

Great credit is due to Mr. Wynn, who not only constructed the gardens and erected the monument, but has also planted and brought into fruition a plantation of 560 bush Apples, 560 Black Currants, a like number of Raspberries, and large batches of Strawberries and other small fruits, and now superintends the whole establishment of ten acres as well as the interior arrangements of the convalescent home. Vegetables are grown in vast quantities and of fine quality, and such produce as is not required for the immediate use of the guests of the Home is either sold or bottled and preserved for future use.

Closely adjacent to the gardens is the farm

Digitized by Google

well stocked and well cropped, and here, too, is another beautiful garden, named the Lady Waring garden, out of compliment to the wife of Lord Waring, who has been a generous benefactor to the Home. Here, under the shade of noble trees, is a delightful water-garden, with aquatic plants on the surface of the pool and luxuriant marsh and bog plants around its margins. On the higher ground grow more herbaceous plants, and in spring the grass is bestrewn with Daffodils and Snowdrops, Primroses, and Anemones—a glorious and peaceful scene.

Altogether, the National Society of Operative Printers and Assistants is to be highly complimented upon the excellence of its Convalescent Home and its charming environment, and congratulated upon the remarkable progress it has made thus far. Other Trade Unions might well emulate the noble example of the Printers. *A. J. Macself.*

THE ROSE GARDEN.

THREE NEW ROSES.

SINCE the appearance of my contribution on the Rose season in Scotland (p. 67) several varieties of recent introduction that I was not in a position to describe or characterise, because they flowered very late in an extremely procrastinating season, have come prominently into bloom. Of these, perhaps the most distinctive in their aspect have been Florence Izzard, W. E. Wallace, and Mrs. Tom Smith, of which the last-mentioned was recently very conspicuous at the great Glasgow Exhibition. Florence Izzard, which had not been introduced by the raiser, Mr. McGredy, at the period when I acquired it, is a pure golden yellow, somewhat after the style of Mrs. Wemyss Quin, but on the whole, though less florally effusive, a larger and nobler flower. It may be said to combine the most gracious characteristics of Golden Emblem with the refined fragrance of the venerable Maréchal Niel. I have often wondered from what sources the famous French Rose, with its familiar martial name, derived its peculiarly fascinating odour, which is very similar to that of the distinguished representatives of Rosa Pernetiana, and their splendidly endowed derivatives of the Emerald Isle, which originally owed this fine attribute to the Persian Yellow, crossed with a beautiful hybrid Tea. Florence Izzard is one of the most perfect Roses of its special colour I have hitherto seen. Its formation is even finer than that of Golden Emblem hitherto regarded as almost incomparable. It is, according to my cultural experience, a vigorous grower (in these days a subject of great importance), and adequately floriferous. It has already found a very formidable rival in W. E. Wallace, raised in the Belmont Nurseries, near Belfast, a variety of great beauty, with luminous foliage, and flowers of faultless form, that open with quite remarkable facility. It may be regarded as one of Mr. Hugh Dickson's very finest creations, and that, in the light of their numbers and distinction, is saying much.

The variety Mrs. Tom Smith has already distinguished itself at Scottish floral exhibitions, where its size, its distinctive colour (carmine, exquisitely shaded with magenta), and its affluence of central petals, have made it a most attractive variety. Among Roses of recent origination it is assuredly a very important acquisition. *David R. Williamson.*

ROSA WICHURAIANA.

THIS is a first-rate Rose for covering dry, shelving banks, old walls, margins of shrubberies, and other places of the kind, for it is a rapid grower, often making shoots a dozen feet long in a season, and quickly forming a dense, prostrate mass of glossy evergreen foliage of a peculiarly fresh and cheerful green. R. Wichuraiana will, moreover, do well in quite poor soils. It is seldom affected by drought and revels in hot sunshine. The flowers, which are single, pure white, and about 2 in. across, are borne in abundant clusters in late August and September, and this is somewhat odd, since all the Wichuraiana varieties of the Dorothy Perkins set, and which are the progeny of this species, flower much earlier.

Though a native of Japan, R. Wichuraiana was introduced to this country from America in 1891. There is a very attractive variety with single red blossoms (said to be a hybrid between the species and Crimson Rambler), and we have a Rose with variegated leaves which also appears to be a form of the same thing. R. Wichuraiana is a naturally procumbent, or creeping, species, a fact which should be borne in mind when planting. It is quite hardy. *A. T. J.*

THE BULB GARDEN.

TULIPA BIFLORA.

WITH T. turkestanica, T. biflora has the distinction of producing several flowers on a stem, and biflora is rather a misnomer, as very frequently there are more than two blooms. It is an interesting plant, but it must be confessed that there are more beautiful Tulips, although not many which will bear from two to five flowers on a stem as biflora may do. These blooms, on stems six to nine inches high, are of a creamy white with a yellow centre and are usually tinged with green outside. The plant succeeds in the rock garden, and is more likely to be useful there than in the border. T. biflora comes from the Caucasus, and is hardy with us. *S. Arnott.*

FIG. 69.—ROSE BETTY HULTON. N.R.S. GOLD MEDAL, SEPTEMBER 20. SEE p. 191.

MILLA UNIFLORA.

THIS is a hardy bulb which was introduced from the Argentine some years ago, and is probably better known as Triteleia uniflora. It is a charming little thing, and bears a single star-shaped milky white flower, suffused with a tint of blue, on a fairly stout stem, at least strong enough to bear itself erect through the storms of spring. It grows with me some 6 or 8 inches high and flourishes well on the rockery with an almost absence of sunshine during the winter months.

Unfortunately it is almost useless as a cut flower, for although the bloom itself has a sweet Primrose-like scent, the stem, where cut, diffuses a pronounced aroma of Onions, which is disagreeable to many. The foliage and bulb have also this peculiarity wherever they may be bruised. The plant is well adapted for spring bedding, and makes a very bright and telling show in its season. It is not necessary to lift the bulbs after flowering; they may remain in the soil if it be light and well drained where they will take no harm and increase rapidly. They should, however, be taken up and replanted every few years, or they become too crowded.

The variety violacea is very similar to the foregoing, save that the flower has more of a pale blue shade, with a darker stripe down each petal. September and October are the best months in which to plant.

Milla uniflora is quite amenable to gentle forcing and will then bloom in January, a month or two earlier than in the open air. Sandy loam and leaf-mould make a good compost, and a dozen bulbs in a 6-inch pot, planted as soon as obtainable, will give a satisfactory result. Very little heat will be required, and if the plants are kept near the glass, strong, sturdy growth will result and a profusion of flowers be obtained. *T. D. T*

ALLIUM FLAVUM.

THIS species of Allium grows about a foot high. It has heads of pretty, small, bell-shaped flowers of rather nodding habit and of a pleasing yellow. It looks best on rockwork, and may be planted in a sunny place, to grow through a dwarf Mossy Saxifrage of the type of Guildford Seedling or S. Fergusoni. It proved perfectly hardy in sandy soil. *S.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER**, 5, Tavistock Street, Covent Garden, W.C.2.

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS**, 5, Tavistock Street, Covent Garden, London. *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement, the Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

MR. KINGDON WARD'S SEVENTH EXPEDITION IN ASIA.*

No. 21.—OVER THE GOMPA LA.

ON October 23 the minimum temperature was 22° F. At dawn a thin film of hoar frost covered everything. The cold delayed us somewhat, but we started at 9 a.m. under the most perfect conditions imaginable.

Scrambling through tangles of a prostrate Haematodes Rhododendron (not R. haematodes itself though; that is said to be confined to the Tali range) whose gaping, star-like capsules had shed their seeds (K.W. 5431), we emerged from the last patch of Fir forest into an immense arena. We were on the rim of a wide basin, at the very foot of the snow peak Half the basin was occupied by a glacier lake which discharged over the rim of the basin on our left by a stream which fell several hundred feet into the valley we had left the previous day. The other half was marsh. Immediately on our right, on the far side of the lake, rose a sheer cliff, perhaps 1,500 feet high, at the summit of which could be seen the edge of the glacier. It was the Gompa La itself.

We were on a well-marked ice-shelf at the head of the main valley, and straight ahead of us was a notch in the range—the pass. The rocks here were covered with dwarf Rhododendron The trailing stems of R. repens (K.W. 5417) were conspicuous amongst Salwenenses, Campylogynums and a twiggy Lapponicum; but in the marsh there were no Rhododendrons—no R. hippophaeoides, for instance, but Primula serratifolia, Pedicularis, Nomocharis, and unrecognisable things.

Ascending a moraine on our left, we climbed by a very steep ghyll, whose flanks were clothed with meadow to the pass. There were several notable plants here—all, of course, in fruit. What looked to be a splendid Nivalis Primula (K.W. 5640) was abundant. It grew a foot high. Equally abundant was an Omphalagramma Primula (K.W. 5461), and the third of the triumvirate was furnished by a Muscarioid, big enough and coarse enough for P. muscarioides itself (K.W. 5464).

And so we reached the summit of the Salween-Irrawaddy divide. On one side of us lay Burma, on the other side China, with a snow peak towering above us to act as boundary pillar. But, as a matter of fact, we could see very little of either Burma or China, only a welter of uninhabited mountains, cut to the bone in every direction. We were 7764 feet above the Salween bed, so that the Gompa La—that is, the pass—is only a few hundred feet below the Si La, over the Mekong-Salween divide. This conclusion agrees very well with the barometer readings on the two passes. From this we are forced to conclude that the snow peak, despite its large glaciers, can hardly exceed 17,000 feet altitude.

In order to get a better view, I ascended the

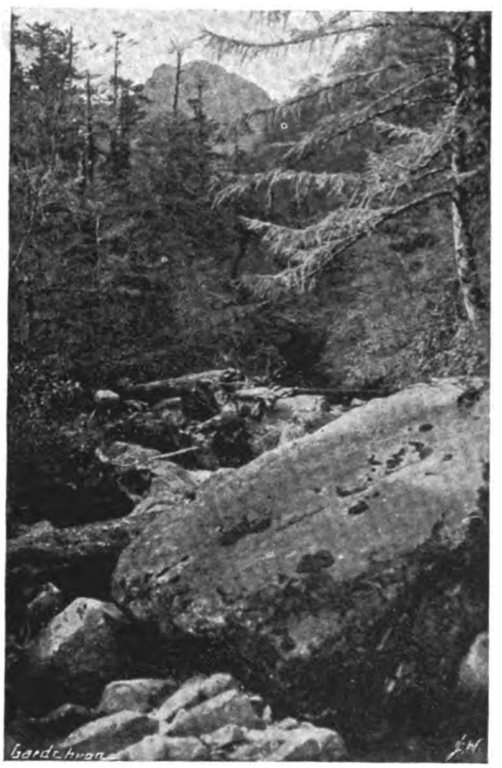

FIG. 70.—LARCHES, FIRS, BAMBOOS AND RHODODENDRONS ON THE DESCENT TO THE TARON.

steep ridge on my left, and from nearly 500 feet above the pass, photographed the Gompa La. (See *Gard.Chron*, August 18, Fig. 37.) The summit was certainly not more than 3,000 feet above the pass.

The streaming flanks of this ridge were absolutely sheeted with a small Primula (K.W. 5462), which must make a fine show in the summer; as this was the north flank, they would assuredly be buried under snow till the end of June. Where the ground was drier, broom and carpet Rhododendrons covered the rocks.

Descending from the pass, we traversed round the head of the valley on a southward course. Everywhere were signs of extensive glaciation. Presently we met clumps of Silver Fir again and more Rhododendrons, amongst which I remarked a Cephalanthum, very like R. cephalanthoides itself in general appearance; unless indeed it was one of the Anthopogons, a Himalayan series which is represented in China only by R. rufescens, one of Delavay's many discoveries. One had always to bear in mind that we were approaching more and more towards Sikkim relationships—as indeed it proved in the sequel.

When we halted for lunch we were able to see many snow peaks to the north, presumably near the Taron curve. Of the Taron gorge itself we could see nothing.

In front of us, but separated by a deep trough, was a lofty ridge which blocked the view westwards; it was connected to our ridge by a narrow, rocky bulkhead, the whole forming a capital H, but lying on its side, thus I We had to cross the bulkhead to the opposite ridge, and then either cross or turn it. We elected to turn it, and having straddled across the bulkhead, moved south down the valley, keeping, however, high up on the face of the mountain.

The men, indeed, knowing what was ahead, wished to remain at our camping-place for the night, saying that it was impossible to reach a camping-place that night if we went on. At least there was water and firewood here, though the place was bleak enough.

I allowed that the natives might know best, but firmly declined to halt here. Two previous attempts to cross the Gompa La had been baulked, and though we were now actually over the pass, I vowed I would never feel safe till the Taron was in sight. So on we went; and presently we were involved in a long and exasperating traverse over boulder screes. The slope faced south and there was little vegetation. The most exciting plant was the ghost of a small "Primulina" Meconopsis, with much longer and narrower capsules than those of the Si La species. It was scattered, but abundant, and I secured good seed. (K.W. 5463.) There were as many as half a dozen single-flowered scapes to each plant, from six to nine inches high. This Poppy was strictly confined to the granite screes. Other plants were Primula dryadifolia, Polygonum Griffithii, a few Saxifrages, Cassiope sp., Gaultheria and other odds and ends.

The sheltered slopes were thickly clad with a warm brushwood of Rhododendron, composed so far as one could see of four species only: R. sanguineum, R. repens, a Lapponicum and a Campylogynum. These slopes were very steep and the downward-sweeping stems of the Rhododendron brush made progress very arduous and in places dangerous.

At five o'clock we reached the end of the ridge and changed direction west again, halting half an hour later under the lee of the cliff. There was a ledge here with a steep slope below—just room to lie down. Unfortunately there was neither water nor firewood, and as our altitude was still over 13,000 feet, it was very cold at night. We were up and away early next morning, breakfastless. But in less than an hour we had turned the obstacle and saw below us the gorge of the Taron, with a wild confusion of mountains beyond. It was British Burma

We halted by a glacier lake for breakfast. The sun was over the range now, drenching us with warm, golden light. Northwards, not far away, we could count half a dozen snow peaks thrusting their heads out of the ruck.

After the morning meal we had a breakneck descent of 2,000 feet to a stream. This slope faced north, and the frozen ground was slippery with hoar frost; only the dense growth of Rhododendron saved us from many a fall. At the summit there were four species, all mixed up together, including the round, furry-leafed haematodes and a quaint species with brilliantly silvered leaves and small trusses of flowers arranged in an umbel, characters which we find in R. glaucum of Sikkim. Also the same rather pungent aroma. But R. glaucum has purple flowers, and in this species they are probably yellow (K.W. 5437).

As we descended to lower levels and warmer temperatures, other species appeared. The first bush or small tree was one of the Fortunei series, rather like R. decorum outwardly (K.W. 5457). With it was one of the Trichocladum Azaleas (seed is included in my lucky-dip packet, K.W. 5458-A), and larger forms of R. sanguineum. Finally we reached the stream and followed it down.

For a mile or two all went well. An obvious path traversed the dense thickets of Bamboo and Rhododendron which lined the stream. Amongst the latter were a Heliolepis and our

* The previous articles by Mr. Kingdon Ward were published in our issues of May 14, June 18, July 23, August 20, September 3, October 8, 29, 1921; January 7, 21, March 11, 25, April 8, 22, May 6, 20, June 3, 17, July 1, 15, 22, August 5, 26, September 9, 23, October 7, 21, November 4, 18, December 2, 16, 30, 1922; January 13, 27, February 10, 24, March 10, 24, April 7, 21, May 5, June 2, 23, July 7, 21, August 18, and September 1, 1923.

Digitized by Google

old Barbatum friend, K.W. 5427, with Sanguineums and a much-gnarled tree with big leaves covered with a rusty orange wool (K.W. 5438). Whether this last is a Falconeri or not, I am unable to say; it certainly bears at least a superficial resemblance to R. arizelum.

Presently the grade of the valley increased and the stream tumbled amongst huge boulders. The mountains closed in, the right bank being furnished with dense forest. It was impossible to follow the stream down any further; the guides said there was a path up the cliff on the right, but it took us an hour's search to find it, and by that time it was too late to go on. So we camped in the bed of the torrent, nearly 4,000 feet below the Gompa La—about 9,600 feet absolute altitude.

The date was now October 25, the minimum temperature was 38° F. The morning was bright and cold when we started up the cliff, following an almost invisible path through the dense forest of Conifers and Rhododendron, and a few other things such as Larch, Oak and Euonymus. All the tree trunks were smothered in Moss and Ferns and small climbing plants.

The most conspicuous Rhododendron was one of the Grande series, like R. argenteum—a branched tree of twenty or thirty feet. There was also R. bullatum and, hanging in thirty-foot festoons from the boles of the great trees, R. Edgworthii; the same species, with beautiful ruddy orange capsules, was seen climbing up the granite cliffs like Ivy, rooting into the crevices (K.W. 5440).

On a bare granite wall facing south I found the remains of a wee Primula, shrivelled in the parching sunshine, and saved a few seeds (K.W. 5443) It appeared to belong to the Yunnanensis section. There were also plants of P. sonchifolia, or an allied form, on the shady rocks.

After ascending a thousand feet, we reached the crest of the spur and descending a little way through the forest, came out into the open sunshine again. Far below the foam gleamed white on a river. It was the Taron. *F. Kingdon Ward.*

PALMS OF THE RIVIERA.*

In my last article I mentioned Schinus molle, the Pepper tree (Faux Poivrier) as the most desirable shelter tree against cold, its spreading branches forming a most graceful roof above the more tender plants. All gardeners know the importance of planting at the same time all the trees, shrubs and other large plants, which are intended to live together on the same place, so that the different subjects may all start their development in a soil not yet full of the roots of their competitors. Therefore one cannot wait for the development of the Pepper trees until they are sufficiently large to shelter the tender plants, but all must be planted at the same time, and it is therefore of the greatest importance to know the size finally attained by the different Palms needing shelter in order that they may be planted in such a way that they shall have sufficient room for their full development. In the first few years more Pepper trees may be grown amongst the Palms than later, and the young Pepper trees will at once offer some protection to the tender Palms. Then, as the Pepper trees grow, those planted where finally there would be no need for them may be removed. Still, even when a great number of young Pepper trees are planted, say at only some two or three metres distance one from the other, it will be necessary sometimes to shelter the more tender of the young Palms during the first years by some other means.

A fairly simple method of protection which I have adopted largely, consists in a circle of strong wire across which is fixed another piece of wire in such a way that it forms an arc reaching about fifteen centimetres above the level of the circle, the circle of wire being supported by three or four legs made of very strong wire. On the circle is stitched a piece of cloth resting on the wire which crosses the circle, thus forming a low canopy. These shelters are very easily and quickly made, and in any size required. I usually make them with a circle of from one to one-and-a-half metre in diameter. The height of the legs varies according to the height of the plant to be protected. I fix a piece of cloth on the legs also as a protection against cold winds, but in any case always leaving the apparatus quite open to the south, as it is very necessary that the plant should receive the benefit of the sunshine in winter, without which these tender plants would not prosper or even survive. The need of shelter against cold hardly ever exists here on the Riviera, except in the night and early morning, therefore the apparatus may be taken away in the daytime and replaced in position in the evening, but where there is a large number of plants the shelter may be left in position day and night, and this is what I have mostly practised, and without inconvenience.

A well-known method of protecting young, tender plants is that of placing a thick layer of dry leaves or similar material around the base of the plant, and in this case also it would be advantageous to remove this material during the hours of sunshine, in order to allow the ground around the plant to be heated by the sun's rays, and replace the material around the plant as soon as the sunshine ceases. It must not be thought that these precautions are absolutely necessary, for very many Palms, provided they are not planted in open ground exposed to cold winds, will resist much cold, even when quite young, though they may suffer somewhat. As the Palms become well established their resistance becomes greater and danger of loss is lessened. I may draw attention to a fact often overlooked, namely, that stagnant, continually moist soil in winter is inimical to the well-being of tender plants, which under such conditions suffer particularly in periods of cold weather. I would therefore strongly advise the planting of such tender subjects in a very light, porous soil, which may be used when filling in the holes made for planting. Even heavy and repeated rains will then not do much harm, since stagnant water will not collect around the young roots. The hole in which this special soil is used should not be less than about one cubic-metre, in order that the plant may grow for several years in the prepared compost, and until it has become more resistant. *Dr. A. Robertson Proschowsky, Jardin d'Acclimatation Les Tropiques, Fabron, Nice, France.*

*The previous articles by Dr. Proschowsky were published in our issues for May 1, June 12, July 10, September 4, November 20, December 18, 1920; March 12, April 30, June 11, October 8, November 19, 1921; January 21, February 11, April 1, June 17, July 29, October 14, November 11, December 23, 1922; March 10 and May 5, 1923.

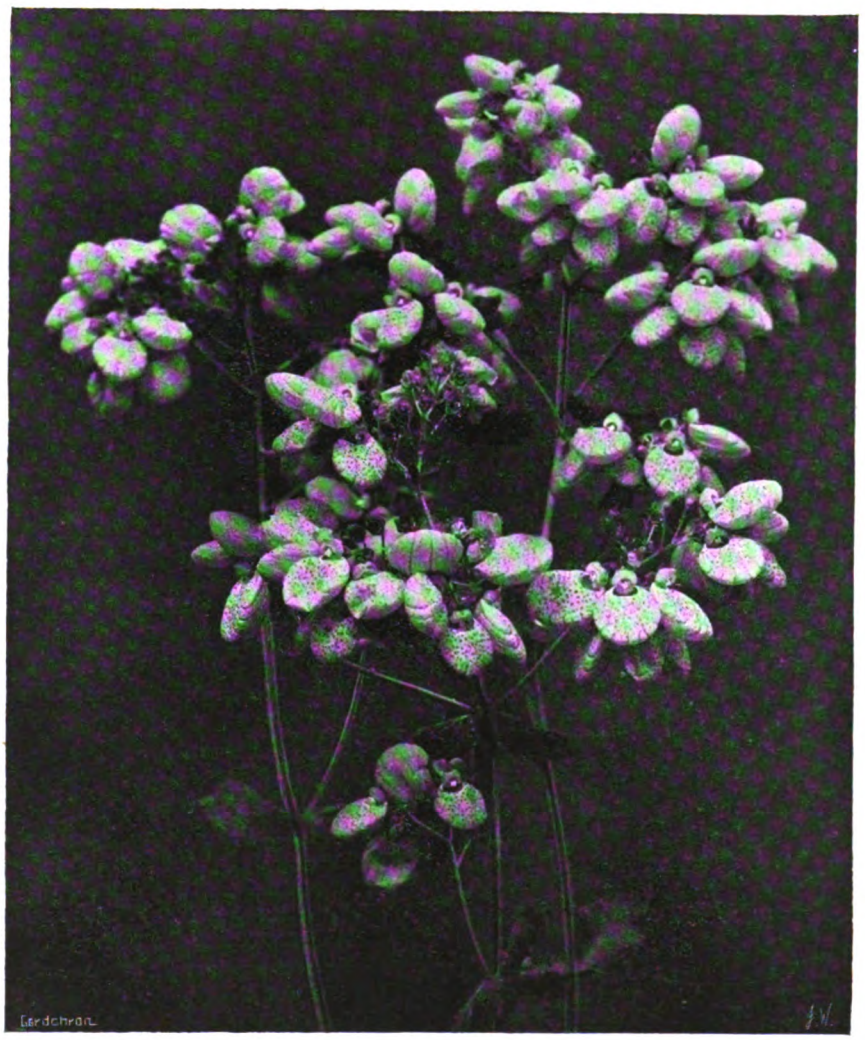

FIG. 71.—CALCEOLARIA SCARLET BEAUTY.

CALCEOLARIA SCARLET BEAUTY.

THE beautiful new Calceolaria illustrated in Fig. 71 was raised in the Botanic Gardens, Glasgow, from a cross made by the curator, Mr. Banks—the parents being C. integrifolia and C. herbacea. It was shown by Lord Lambourne at the meeting of the Royal Horticultural Society, on August 8 last, under the name Glasgow Beauty.

Mr. E. Matthews, Director of the Glasgow parks, informs us that Scarlet Beauty is one of four seedlings considered worthy of retaining. The other three are grown in the Botanic Gardens, and although not so striking as the one indicated in the photograph, are quite good for general purposes in greenhouses and conservatories. The variety illustrated is very free flowering, bearing numerous heads of orange-yellow flowers spotted with reddish-scarlet, a combination of colouring that is very effective.

POMOLOGICAL CONGRESS AT STRASSBURG.

THE 59th Pomological Congress was held on September 7 and 8 at Strassburg, the beautiful capital of Alsace, more than 200 French and foreign growers being present.

The annual report of the Pomological Society was presented. The membership is now over a thousand, and it is hoped to make the work of the Society in the future of a greater importance and authority. Plans were discussed for improving the Journal published by the Society, for the better upkeep of the Sandar experimental garden, the publication of a popular catalogue of the best fruits, etc., and in order to provide funds for these purposes, the annual subscription was raised to twenty francs a year.

Of the fruits submitted to the Committee, Bigarreaux Noir d'Ecully and Souvenir des Carmes, and Peach Charles Ingouf, were accepted; Almond Bruantine, Pears Constant Lesueur and Directeur Tisserand, and Apple Reinette Schmitberger, were rejected.

Various subjects appeared on the programme of the Congress. In a discussion on Experimental Orchards for Fruit Culture: Their Objects and Organisation, speakers referred to the necessity for experimental gardens; many growers find it impossible to maintain trial grounds at their own expense, the cost since the war having become prohibitive. This task should devolve upon the various agricultural administrations, in collaboration with local societies. Experiments with manures, insecticides, and fungicides, for instance, should be carried out on a large scale. The congress passed a resolution to the effect that experimental orchards be established in various districts, under the direct control of the horticultural federations, and subsidised by the local agricultural administrations.

In a paper on the influence of altitude and climate in the cultivation of dessert fruits, it was said to be sometimes possible to grow in a favourable aspect, in a mountainous region, varieties of fruit trees which succeed only partially, or not at all, in general in the plains. M. Loiseau reported having seen, in the Alpes Maritimes, Apricot plantations giving regular and abundant harvests of good fruits, at altitudes varying from 800 to 900 metres, results which are far from being obtained in similar latitudes on ground at a lower level.

The question of determining causes of the fertility of trees and the quality of fruits was very fully discussed. The partisans of summer pruning for Apples and Pears, and its opponents, gave the best reasons for retaining their respective opinions, but on the whole the advocates of pruning had the best of the argument. With regard to the influence of the graft on the stock, it was said that double-grafting is employed, especially in the case of the Pear, to invigorate varieties of feeble growth. It is also found to induce quicker growth and development of the tree. In general, the intermediate graft is reduced to a stump without leaves 20 to 30 cm. in length, which does not develop further, and is able only to a very small degree to influence the final form of the variety. M. Passy remarked that it would be preferable, if possible, to preserve a leafy portion on this stump, which would serve to draw up the sap. Re-grafting has the further advantage of insuring a perfect junction in the case of varieties which do not take readily to the stock. In discussing the influence of scion on stock, a great divergence was reported when taking up young grafted trees; the Quince grafted with different varieties of Pears had a root system which varied according to the nature of the graft.

Dr. Chifflot gave details of recent observations made by him on the various diseases affecting fruit trees. A paper on a study of fruit tree cultivation and local varieties in Alsace showed that fruit-growing is very well developed in Alsace. In 1913 there were nearly eight million fruit trees in the province, of which 400,000 were stone fruits. Many of the roads are bordered with fruit trees. Metz produces great quantities of the Mirabella Plum. It was recalled that formerly in Alsace children were given fruit trees as rewards, to plant in their gardens.

After a number of agreeable meetings and social functions, the members of the Congress made some very interesting excursions in autocars to the different horticultural and fruit-growing centres in Alsace and Lorraine.

The next pomological congress, in 1924, will be held at Angers.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante, pp. 71-76.)
(*Continued from page* 176.)

ENGLAND, S.W.

GLOUCESTERSHIRE.—The crops of Plums and Damsons are very light, and the trees have suffered severely through attacks of aphis and cold weather in early summer. Apples have also suffered, particularly in gardens and fruit plantations. There will be more Apples in grass orchards than were anticipated at one time, and trees growing under these conditions have not suffered so much through insect pests. Pears are practically a failure, and entirely so in the case of perry Pears in orchards. Red Currants and Gooseberries were both good crops, though many of the latter berrics were affected with American Gooseberry mildew. The Black Currant crop was considerably harmed by aphis, and the Strawberry crop by drought. On the whole it is a disappointing season for fruit, owing to cold, dry and sunless weather and severe attacks of pests. *G. H. Hollingworth, Shire Hall, Gloucester.*

HEREFORDSHIRE.—The frosts and cold north-easterly winds during the months of April and May ruined the blossoms of Apricot and Plum trees, which were a mass of flower in this district. Apple trees at one time looked promising for good crops, but the fruits failed to set. The amount of Peach and Pear blossom was very much below the average. *F. Roberts, Stoke Edith Park Gardens, Hereford.*

——Plum trees were a magnificent sight when in blossom, but the young leaf-buds were injured by cold and dry winds—followed by leaf curl and aphis, there being a kaleidoscopic change from masses of blossom to almost apparently dead trees. Mealy aphis appeared early in July and added to the damage. Apples are a very fair crop on some trees, especially such as did not bear much, or at all, last year. Various pests are numerous on the trees, especially caterpillars, and of maladies white mildew (Sphaerotheca) is prevalent. Orchard fruit is variable, but the yield is small. In the case of Pears both blossom and setting of fruit were very poor. In orchards Plum fruits are practically nil. Gooseberries, and Black and Red Currants yielded well, and the quality also was good. The setting of Strawberries was much affected by cold weather during the blossoming period. Grafts have not succeeded well, except against the shelter of walls, suggesting that temperature is the main cause of the trouble. *H. E. Durham, Dunclm, Hereford.*

SHROPSHIRE.—All fruit trees, with the exception of Pears, bloomed fairly well, but late spring frosts seriously affected the crops in exposed positions. Red and White Currants were plentiful, but Black Currants were much under the normal yield. Certain varieties of Plums are carrying fair crops. Most of the trees are clean and healthy after winter spraying. Our soil is a heavy, retentive loam and the natural drainage is good. *Roger F. Jones, Oteley Hall Gardens, Ellesmere.*

——The fruit crops are very disappointing. Most fruit trees flowered well with a good promise of fruit, but severe frosts and other adverse conditions followed. We especially suffered from severe drought and sunless weather in this district until the end of June, resulting in an almost total failure of the fruit crops. Severe attacks of aphis have also troubled us. The soil is a heavy, tenacious boulder clay, going down a very great depth, which makes a cold subsoil, and very difficult working surface soil, in which pests of all sorts abound. *E. F. Hazelton, Yeaton Peverey Gardens, Bomere Heath, Shrewsbury.*

WORCESTERSHIRE.—It is a most disastrous season for nearly every kind of hardy fruits, the worst I ever remember for upwards of half a century. Apples will come out best. The old Blenheim Pippin has a fairly good crop throughout this part of the country, the very opposite to last year. The cold sunless season favoured the most persistent attacks of aphis, which came in shoals of winged specimens in spite of any and every insecticide used, either by dipping or spraying. Many Plum trees were quite defoliated; the aphis appeared to attack Plums first, and as soon as this food became scarce, to migrate to other trees, and Hops also, hence Hop growers are always anxious as to the condition of Plum orchards, which are a breeding ground for aphis. *William Crump, V.M.H., Oakridge, Malvern Link.*

——The Apple crop promises fairly well, considering that insect pests have been most persistent. Plums, except Pershores, are very scarce—only where spraying has been followed up is there any fruit. Black Currants were a failure, but Gooseberries were a good crop. Strawberries were very plentiful, but the long spell of dry weather prevented them from developing. Our soil is a heavy loam, overlying clay, and owing to a wet winter we were unable to fully break up the lumpy ground. *Geo. H. Emmett, Hill Crest Gardens, Evesham.*

——The Apple crop is the worst we have had for several years, although the following varieties are carrying good crops: King of the Pippins, Lord Grosvenor, James Grieve, Worcester Pearmain, Lord Suffield, Charles Ross and Cellini Pippin. Many varieties are quite bare of fruits. The Pear crop is a total failure. Gooseberries were very plentiful, and Black Currants were also a good crop. *Ernest Avery, Finstall Park Gardens, Bromsgrove.*

——The majority of the fruit trees blossomed well. Plums blossomed profusely after carrying a record crop last year, but the late frosts did a great deal of harm. In exposed positions Gooseberries and Black Currants suffered greatly, but where the bushes were sheltered they had average crops. Pears are scarce. Apples are under the average, but early sorts cropped satisfactorily. Apricots were under the average, having failed to set in spite of protection. A few of the early Strawberries were caught by frost, and the crop would have been greatly improved had rain fallen. All fruits are feeling the effects of the drought. We had drying winds during April, and only two inches of rain during May and June. The soil is of a heavy nature, resting on gravel. *G. E. Roden, Overbury Court Gardens, Tewkesbury.*

——The fruit crops are the worst on record. Apple and Plum blossom was small, and the weather wet and cold at the time of blooming, whilst the trees were covered with blight in spite of washing. Pear trees did not bloom after carrying such a heavy crop last year. Gooseberries, Currants and Loganberries were all good crops. Raspberries and Strawberries were small owing to dry weather. I have never seen green and black aphides so plentiful; they attacked nearly everything in the gardens. Our soil is a stiff loam on clay. *C. A. Bayford, Davenham Gardens, Malvern.*

——The spring of 1923 proved disastrous to the fruit crops. Not only did "Winter sit in the lap of spring," but in the lap of summer also. Strong, dense and cold winds, moving with considerable speed from more than one point of the compass, did injury to the opening and tender leaves, and also to the petals of the flowers; and the low, icy temperature completed the destruction of their reproductive organs. The adverse conditions have caused serious injury to many trees, as well as to their crops of fruit. *James Udale, 7, Ombersley Road, Droitwich.*

INTERNATIONAL HORTICULTURAL CONFERENCE AT AMSTERDAM.

In commemoration of its fiftieth anniversary, the Royal Netherlands Horticultural and Botanic Society held an International Horticultural Conference at Amsterdam on September 18 and 20, but, as a full programme of visits and hospitality was added, the proceedings, commencing with a reception on Monday, September 17, did not conclude until September 23. We do not remember any horticultural celebration of so interesting and varied a character, and for the sake of those who may have to make arrangements for a horticultural conference on international lines we append the programme:—

MONDAY, SEPTEMBER 17.

Reception of delegates and representatives in the rooms of the Restaurant Trianon at 8 p.m.

TUESDAY, SEPTEMBER 18.

First session of the Conference, at 9 a.m., in the University Building.

Opening address by the President of the Society, Jonkeer G. F. van Tets. Election of President and four Vice-Presidents for the Conference. Address by Vice-President M. Cayeux representing the Société Nationale d'Horticulture de France.

Papers by Dr. Johanna Westerdyke, of Baarn, on "Horticulture and Plant Diseases"; Mr. Ernst H. Krelage, of Haarlem, on "The Development of the Dahlia"; and Mr. K. C. van Nes, of Apeldoorn, on "The Care of the Beauties of Nature, and the Improvement of Landscape Scenery in Town Planning."

Lunch at the Krasnapolsky Restaurant.

Second session of the Conference at 1.30 p.m. Address by Vice-President Prof. Bateson. Papers by Mr. R. G. Hatton, of East Malling Research Station, Kent, on "The Influence of Root Stocks upon Fruit Trees"; Dr. O. Schindler, of Dresden, on a "Contribution to the Problem of the Root Stock in Fruit Trees"; Prof. L. Daniel, Rennes, on "Graft Hybrids."

Visit to the Netherlands and Netherlands-Indian Exhibition and Dahlia Show; reception by the officials.

Reception by the Burgomaster and Town Council of Amsterdam at the Maison Couturier from 8 p.m. to 10 p.m.

WEDNESDAY, SEPTEMBER 19.

Trip to Boskoop, starting at 8.15 a.m. for Gouda, thence by boat to Boskoop; group visits to various nurseries. Luncheon at the Hotel Neuf at 12.35. Departure at 1.45 by motor-cars to The Hague. Reception by Her Majesty Queen Wilhelmina at Huis ten Bosch at 3.40. Return to The Hague at 5.30, dinner, and then by train to Amsterdam.

THURSDAY, SEPTEMBER 20.

Third session of the Conference at 9 a.m. Opening address by Vice-President Dr. J. P. Lotsy. Papers by Prof. Bateson, John Innes Horticultural Institute, on "Root Sports"; Mr. E. Lierke, Berlin, on "The Influence of Manures upon the Quantity and Quality of Fruits and Vegetables"; Dr. E. Tschermak, Vienna, on "Some Hybrids between Species and Races in Primula."

Lunch at the Krasnapolsky Restaurant.

Fourth session of the Conference at 2 p.m. Opening address by Vice-President Dr. Tschermak. Papers by Mr. E. Furedi, of Budapest, on "Professional Horticultural Education in Hungary and the International Exchange of Pupils"; Mr. K. Dilling, of Zutphen, on "School Gardens"; and Dr. F. Oedewelt, Amsterdam, on "Allotment Gardens."

Thanks to contributors of papers and other helpers. Close of session.

Official dinner given by the Royal Netherlands Horticultural and Botanic Society at the Restaurant Trianon at 7 p.m.

FRIDAY, SEPTEMBER 21.

Excursion to Aalsmeer, Haarlem, and Lisse. Start from Amsterdam at 9 a.m.; arrival at Aalsmeer at 9.43 a.m.; inspection of Auction Flower Market and visits to various flower-growing nurseries. Light refreshments at 11.45.

Departure of special train to Haarlem at 12.15. Lunch at the Hotel Lion d'Or. Organ recital at St. Bavo Cathedral, given by the Haarlem Town Council.

Departure by motor-cars to Lisse at 2.30. Inspection of the State School for Bulb Growers or the State Phytopathological Laboratory. Departure by motor-cars to The Hague at 4 p.m. Arrival at The Hague at 5.30, where the Conference delegates found their luggage awaiting them in their rooms at the hotels assigned.

Reception by His Excellency the Minister for Home Affairs and Agriculture in the Salle des Chevaliers at 8 p.m.

SATURDAY, SEPTEMBER 22.

Excursion to Rotterdam and Hook of Holland. Departure from The Hague at 8.50 a.m. Special trams awaiting at Rotterdam to convey the party to the Maas Station. Departure by boat at 9.50 a.m. for a tour of the harbours of Rotterdam—offered by the Town Council of the city. Arrival at Parkkade at 11.50, and departure by boat to the Hook of Holland at 12 o'clock; luncheon on the boat. Arrival at The Hook at 2 p.m.; inspection of the loading of Dutch vegetables on the G.E.R. boats for England; inspection of various nurseries and the auction sale-rooms; refreshments offered by the Westland Union of Auction Societies. Departure at 4.45 by motor-cars to Loosduinen and The Hague; tour through the parks at The Hague.

SUNDAY, SEPTEMBER 23.

Excursion to Zeist, Wageningen, and Rosendaal, offered to foreign members only.

Departure from The Hague to Utrecht at 10.12 p.m.; by motor-cars to Zeist; visit to Jonkeer van Tets' home at Valchenbosch, where he entertained the party to lunch. Departure to Wageningen by motor-cars at 1.20 p.m. Inspection of the Arboretum and a State phytopathological exhibit at Wageningen. Departure for Rosendaal at 3.35 p.m. Tea given to the party at Rosendaal by Baron von Pallandt van Rosendaal, a vice-president of the Society.

Departure for Arnhem at 5.30; dinner at the Restaurant National.

End of programme.

HOME CORRESPONDENCE.

Gloxinias and Streptocarpus.—Dr. Wood's garden at Woolpit, Bury St. Edmunds, is not a very extensive one, and it is laid out in so formal a manner that those who admire the informality of Nature hold up their hands in horror at the sight; but it pleases its owner, and that is the essential thing after all. With a view to achieving the finest results, Mr. Lewis Coleby, the head gardener, concentrates on special features, and those of the present moment are Gloxinias, particularly in pure white, and Streptocarpus, in widely varied hues. The seeds of both were sown during the first week of March, and the plants, now in 3½-inch pots, are flowering freely, and creating a splendid effect. Out of doors the most brilliant picture lies in the flowers of a bright scarlet Pentstemon, which are richly gorgeous. All these are from Messrs. Sutton and Sons' strains, and they do infinite credit to that firm and to the gardener who has grown them so well. *Horace J. Wright.*

Pelargonium Rollison's Unique (see p. 177).—I believe that Prof. Bateson, of the John Innes' Institute, Merton, would be able to supply Mr. Lynch with the reason why this interesting Pelargonium produces two types of bloom, for, if my memory serves me right, he made investigations in the flowers of this plant some years ago. Mr. Beckett grows this beautiful Pelargonium for summer bedding at Aldenham House gardens, and perhaps he would be able to say if any of his plants have produced flowers of two colours. *T.*

SOCIETIES.

NATIONAL ROSE.

SEPTEMBER 20 AND 21.—The Autumn Show of the National Rose Society, which was held in the R.H.S. Hall, Westminster, on these dates, must have been embarrassingly successful to the enthusiastic Hon. Secretary (Mr. Courtney Page) and the Council. The staging capacity of the hall was taxed to its utmost, and before noon there was a goodly queue waiting admission. Throughout the day the hall was filled, and at times uncomfortably so, with enthusiastic rosarians. Generally on second days the attendance at flower shows is but moderate, but so late as 4 p.m. on the Friday the hall was filled with visitors. We understand that the National Rose Society will hold its Spring and Autumn Shows in the future in some more commodious place.

The general quality of the Roses was, in this notoriously poor "Rose Year," surprisingly high; thus has Nature compensated for the disappointing summer crop of blooms, and in almost every class the competition was very good. Most of the many thousands of blooms were of good size and shape, while their colouring was, in the case of many varieties, brilliantly beautiful. But it was remarked that their fragrance was, as a rule, but slight. In the nurserymen's classes there was a regrettable tendency to "dress" the exhibition varieties, which in every instance destroyed the character of the varieties without in the slightest degree improving the blooms.

Although there were over forty seedling Roses it cannot be said that there were any epoch-making varieties amongst them, but many of them have merits. Two Gold Medals and five Certificates of Merit were awarded.

GOLD MEDALS.

Betty Hulton (see Fig. 69).—A H.T. variety which in the bud state is very pretty and of good form, but the fully-expanded blooms are rather shapeless. The rich yellow colour is, however, very fascinating, and it is probably to this, with the variety's apparent freedom in flowering, together with the long, straight stalks, that it owes the premier award. It is of loose globular form, and the broad petals are occasionally flushed with pale orange-yellow. Shown by Messrs. ALEX. DICKSON AND SONS.

Shot Silk.—This H.T. Rosé of glowing colouring was also shown at the Summer Show at Regent's Park. It was illustrated in *Gard. Chron.*, July 7, Fig. 5. As is the case with its fellow Gold Medal variety, the form leaves much to be desired. When mature the blooms are roundish and of a beautiful cherry-red colour flushed with rose-pink. There is an attractive golden-yellow base to each petal. The foliage is good. Shown by Messrs. ALEX. DICKSON AND SONS.

CERTIFICATES OF MERIT.

Mabel Turner.—A shapely H.T. variety which may almost be described as a slightly paler and very pointed La France, but without its delicious perfume. It is very pointed conical in form, and the broad recurving petals show the silvery reverse. The foliage is clean and good and the blooms are borne on long, stout stems. Shown by Messrs. HUGH DICKSON, LTD.

Phyllis Bide.—An especially pretty Polyantha variety which freely bears good trusses of rather more than semi-double flowers of pale rose-pink colour broadly tipped with pale golden yellow. It also has good, clean foliage. Shown by Messrs. S. BIDE AND SONS.

Oliver Mee.—Another shapely H.T. Rose, fully double and flushed with Peach-pink on creamy ground. It is recommended for the garden and for exhibition purposes. Shown by Messrs. HUGH DICKSON, LTD.

Victor Waddilove.—A beautiful H.T. variety of good form, suitable for all purposes. It is of a bright pink shade of colour and has good stalks and small dark green foliage. Shown by Messrs. S. MCGREDY AND SON.

Aurora.—This new Rose might well be termed a deep primrose-yellow Nur Mahal, for it is also a Hybrid Musk variety and similar in shape

Digitized by Google

and freedom of flowering. Shown by REV. J. H. PEMBERTON.

OTHER NEW ROSES.

The variety Margaret McGredy was generally expected to have been selected for an award, but somehow failed to impress the Committee In general appearance it may be described as being The Queen Alexandra Rose without the rich yellow reverse and with rather more scarlet in its colouring. Mrs. J. Heath is another H.T. variety of merit. It is of flattish shape and of cream yellow colour flushed with pink, especially in the centre of the blooms. Jane Boyd is a well-formed H.T. Rose of good size and golden buff colouring lightly overlaid with rosy-purple. It has small purplish foliage. Fanny Oppenheimer was the most brilliant Rose in the show and might well have received an award for its colour alone. It is also a free-flowering variety. This H.T. is of good form in the bud state, though rather loose when mature, but the petals are substantial and would apparently withstand bad weather. The brilliant cardinal colour is enhanced by golden-yellow at the base of the petals. Mrs. C. W. Edwards is a large, substantial, fully double H.T. Rose of good form in all stages, and of deep rose-pink colouring. Lady Sackville is the darkest of all the new Roses, but although small the blooms are solid and of lumpy appearance. It did not possess the rich fragrance usually associated with dark crimson maroon varieties. Mrs. S. Paton is a very beautiful rich rose-pink H.T. variety, suffused with golden-yellow on the reverse of the petals. Joan Waddilove might almost have been named Goldilove, for the golden reverse to the petals was very prominent and was lightly flushed with purplish rose-pink. It is a small garden variety. All the above were shown by Messrs. S. MCGREDY AND SON.

Sadie, shown by Mr. GEORGE PRINCE, an H.T. of creamy orange-apricot colouring, is a moderately fragrant variety and has very good foliage. Richard E. West is a good yellow-coloured H.T variety, fully double, and possesses good stems. George Mackereth is a velvety crimson H.T. variety of good form. This and the foregoing were shown by Messrs. ALEX. DICKSON AND SONS. Earl Beatty, a crimson H.T. of flattened shape and apparently very free-flowering, was shown by Messrs. CHAPLIN, BROS. Nur Mahal, shown by the REV. J. H. PEMBERTON, had already received a Certificate of Merit, and has been shown regularly during the summer. It is a free-flowering hybrid Musk Rose of light red colouring. J. G. Looymans is a good general purposes yellow H.T. variety, with its buds flushed with orange-yellow. Elvira Aramayo, a small, showy H.T. of Indian red colour, suffused with cerise, is a good bedding Rose. Mussolini, a round-shaped, fully double H.T., is flushed with Peach-pink and has a golden buff reverse. Alice is a very good dwarf Polyantha Rose bearing plenty of smallish flowers of old-fashioned Rose-pink colouring. The four above-named were shown by Messrs. D. PRIOR AND SON. Etoile d'Holland was found to have been distributed in 1921 and so was withdrawn. It is a beautiful and fragrant H.T. of rich crimson maroon colour, paler at the tips. The petals are substantial and have the characteristics of a good Rose for inclement weather. It was shown by Messrs. HENRY MORSE AND SONS. Lady Charmion, shown by Messrs. BEES, LTD., is a medium-sized rosy cerise H.T. of value as a garden variety.

GROUPS OF ROSES.

The large collections of representative cut Roses were a most valuable feature of the show. Not only did the exhibits in the larger class fill the staging along the whole length of the hall, but they overflowed into the body of the building. The general quality was so high that the judges recommended additional prizes, and even so, really meritorious collections were, perforce, unrewarded. The merits of the two leading displays were remarkably even and must have caused the judges considerable anxiety. The first prize was awarded to Mr. T. ROBINSON for an especially fresh collection which was arranged with considerable skill, though his association of colours was not quite so successful as that of the second prize exhibitor. But it more than made up for this in the lightness of the groundwork. Mr. Robinson had very beautiful stands of Emma Wright, Ophelia, Golden Emblem, Col. Oswald Fitzgerald and K. of K.

Richness of colour was also very noticeable in the blooms so well arranged by Messrs. S. MCGREDY AND SON, who were awarded the second prize. The tall stand of The Queen Alexandra Rose was dazzlingly beautiful and harmonised well with those of Los Angeles, Isobel and Lady Pirrie. At the ends of the collection there were fine masses of Golden Emblem and Christine. The third prize was awarded to Messrs. A. J and C. ALLEN for a very pleasing display. Messrs. CHAPLIN BROS., who were fourth, had effective arches of Mrs. Hy. Bowles with climbing Ophelia.

In the smaller group class Mr. GEORGE PRINCE was first with a remarkably fresh collection of high-class blooms. His chief varieties were Souv. de Claudius Pernet, Los Angeles and Mrs. George Shawyer. Mr. WALTER EASLEA, who was second in this strong class, included excellent vases of Melody, Mrs. Hy. Morse, Hoosier Beauty and James Walley. Mr. F. J. EDWARDS was third.

The same high quality obtained in the class for 18 distinct varieties where Messrs. A. WARNER AND SON were first. They had beautiful vases of Padre, C. V. Haworth, Golden Ophelia and Independence Day. Mr. F. SPOONER was second and he included Severine, Golden Ophelia and Golden Emblem. Messrs. J. JEFFRIES AND SON were third. The first prize 24 varieties of decorative Roses were staged by Mr. GEORGE LILLEY, who, in Marcia Stanhope, a pure white H.T. of medium size, had the most fragrant Rose in the show. Messrs. MATTOCK were second, and they had a good collection which included Lady Pirrie, Hadley and Padre.

Messrs. HUGH DICKSON, LTD., who were first with three baskets of exhibition Roses, showed J. G. Glassford, W. E. Wallace and Marjorie Bulkeley in great beauty. Mr. C. GREGORY was second. The best three baskets of decorative Roses were charming arrangements of Betty Uprichard, Lady Inchiquin and Lady Pirrie shown by Messrs. ALEX. DICKSON AND SONS. This was an especially good class, and the second prize exhibit by Messrs. CHAPLIN BROS. included lovely baskets of Ophelia and Golden Emblem. Messrs. LANE BROS. showed three delightful baskets of the dwarf Polyantha Roses Mrs. W. H. Cutbush, Jessie and Orleans, and won the first prize. Mr. ELISHA J. HICKS was second.

EXHIBITION ROSES.

The general quality of the Roses shown on boards was very high. The blooms were of good size and of fresh colouring, but, as we have previously suggested, much of their beauty was lost through "dressing."

In the premier class, which called for 24 blooms, distinct varieties, Messrs. HUGH DICKSON, LTD., were first with an exceedingly fresh and bright collection of such varieties as George Dickson, Lady Alice Stanley, Capt. Kilbee Stewart, H. V. Machin and Molly Bligh. The second prize blooms of Messrs. D. PRIOR AND SON were larger, but their collection rather lacked colour. Their best blooms were Mrs. George Norwood, George Dickson, J. G. Glassford and Mrs. J. H. Welch. Mr. J. PIGG was third.

The first prize exhibit of 18 varieties, shown by Mr. GEORGE PRINCE, was a remarkably good one. He included George Dickson, C. E. Shea, Admiration, Golden Emblem and Martha Drew. In the second prize collection of Messrs. F. SMITH AND SONS there was a perfect bloom of Gorgeous, the Silver Medal bloom of the Nurserymen's Classes. Messrs. G. LONGLEY AND SONS were third.

The high quality was not continued in the Tea and Noisette Class, which was only moderate. Mr. GEORGE PRINCE was first, and Messrs. D. PRIOR AND SONS were second.

AMATEURS' CLASSES.

Throughout these classes the competition was very good and in most instances the quality was exceedingly high. This was particularly so in the class for Tea and Noisette varieties, and here, as at the Regent's Park show, they easily eclipsed those of the trade growers. The first prize six blooms shown by Dr. HAYES, Dunster, were magnificent, and the very best were Maman Cochet, White Maman Cochet, Mrs. E. Mawley, and W. R. Smith. The REV. F. R. BURNSIDE, Great Stanbridge, who was first with nine blooms, had beautiful specimens of Alex. Hill Gray and Mrs. Foley Hobbs.

Mr. TURNBULL, Colchester, had the best 12 exhibition varieties, and included splendid blooms of E. M. Burnett, Constance Cassoon and Rev. F. Page Roberts. Mr. GULLIVER SPEIGHT, Market Harboro', the second prize-winner, had a magnificent specimen of George Dickson which was adjudged the Silver Medal bloom in the Amateurs' Classes. Mr. F. H. FIELDGATE, Colchester, showing such varieties as George Dickson, Augustus Hartmann and Mrs. Chas. Hunter, won first prize in the class for nine varieties. In the class for six varieties Mr. R. DE V. PRYOR, Hitchin, had an excellent collection of such varieties as Gorgeous, George Dickson and Mrs. J. Laing, and won the first prize. Mr. F. SPENCER, Harrow, had the best six blooms in the class for smaller growers, and Mr. C. CHAMBERS, also of Harrow, was first in the class for growers with gardens within ten miles of Charing Cross.

Mrs. BALFOUR, Oxford, was first with a lovely basket of Irish Elegance. Mr. G. MARRIOTT, who mixed Golden Emblem and Col. Oswald Fitzgerald, was first in the other basket class and he also had the best of many exhibits of six distinct varieties of decorative Roses.

ARTISTIC SECTION.

In the open classes the first prize dinner table decoration was a charming arrangement of melody by Mrs. TISDALL, Woodford Green. Miss MURIEL CANT, Colchester, was second, and Mrs. A. R BIDE, Farnham, was third. The best bowl of Roses was that of Golden Emblem arranged by Mr. W. R. APPLETON. In the Amateurs' Section Mrs. COURTNEY PAGE again won the first prize She had a delightful table of Ophelia. Mrs. A. D. RUFF, Sharnbrook, who used Melody very effectively, was second. Showing an artistic bowl of Melody, Mrs. COURTNEY PAGE was also first in another class.

THE CORY CUP.

The Cory Cup, which is offered for the best seedling Climbing Rose of the year, and has been open to competition at all three shows, was awarded to Allan Chandler, a lovely semi-double H.T. variety shown by Mr. GEORGE PRINCE. The flowers are of good size, of bright scarlet colour slightly suffused with velvety crimson and have a pleasing fragrance.

BERMONDSEY FLOWER SHOW.

THE municipal horticultural exhibition held in the Town Hall, Bermondsey, on Thursday, Friday, and Saturday, September 13-15, was a great success. This show was organised by a joint committee of the Bermondsey and Rotherhithe Horticultural Society and the Beautification Committee of the Bermondsey Borough Council.

The show was well arranged, and gave ample facilities for inspection of the exhibits. The largest exhibit was put up by the Gardens and Open Spaces Department of the Bermondsey Borough Council, consisting of a central group of plants backed up with numbers of Dahlias and other flowers, with a border of Violas and grass. Trade exhibits were staged by Messrs. BEES, LTD., of Liverpool, who staged Roses, Phloxes, and other hardy herbaceous plants in splendid variety. Messrs. WELLS, JUNIOR, Merstham, exhibited Delphiniums, Michaelmas Daisies, Lupins, and Helianthus in variety. Messrs. WILLIAM YANDELL, Castle Hill Nurseries, Maidenhead, exhibited a fine collection of Violas and Chrysanthemums. Messrs. J. CHEAL AND SONS, LTD., Crawley, showed Dahlias, including Star, Collerette, and Paeony varieties. Mr. AMOS PERRY, of Enfield, also made an effective show with Phloxes, Michaelmas Daisies, Heleniums, Pentstemons, and Kniphofias. Messrs. H. J. JONES, LTD.,

Digitized by Google

Lewisham, staged Delphiniums, Hydrangeas, Ferns, and other foliage plants. Mr. MILLS, of Southwark Park Road, exhibited a fine assortment of Carnations and Chrysanthemums.

Competition in the vegetable classes was not so keen as usual, owing to the unfavourable season. Some excellent Onions, Beans, Tomatos, Vegetable Marrows, Carrots, and Parsnips were shown. The first prize collection of vegetables, from Mr. R. CHIVERALL, Dulwich, was excellent in every respect, and tastefully arranged. Mr. BUTCHER, Ford Road (the winner of the *Daily Telegraph* prize for the best garden in London), was second. Competition in the children's classes was very keen. Some very good specimens of plants, wild flowers, and bouquets were shown.

There were some splendid examples of window and pot plants, the competition in these classes being again keen. The Liliums were a feature, and a credit to any area.

Cut flowers and bouquets were well represented, and some excellent Dahlias, Antirrhinums, Carnations and Gladioli were shown.

There were three entries in the class for table decorations, and the task of deciding the prize-winner was not an easy one.

A feature of the show was the fine series of drawings and paintings exhibited from various schools. The paintings on silk were extremely praiseworthy, and called for a great deal of admiration. Handicraft exhibits were submitted from the Southwark and Bermondsey Day Continuation School.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE monthly meeting of this Society was held in the R.H.S. Hall, Westminster, on Monday, September 10, Mr. T. R. Butler in the chair. Three new members were elected. Two members withdrew interest from their deposits amounting to £4 19s. 4d., and two members over the age of 70 years withdrew the sum of £74 2s. 11d. from their deposit accounts; the sum of £8 10s. 8d. was passed for payment to the nominee of one deceased member residing abroad. The sick pay for the month on the private side was £58 8s. 3d., and on the State section £69 3s., whilst maternity claims amounted to £16. The Society's annual dinner will be held on November 1 at the Imperial Hotel, Russell Square, under the presidency of Sir William Lawrence; tickets for the dinner may be obtained from the secretary, Mr. A. C. Hill, 35, Alexandra Road, West Kensington Park, W.14.

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 4.—The ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. W. G. Pirie, vice-president, in the chair.

A paper, illustrated by lantern slides, on "The Coniferae and Their Uses," was read by Mr. A. D. Richardson. The descent of the Gymnosperms was traced in the fossil flora from Devonian times, when the Coniferae were represented by the highly organised Cordaites, the present-day representative of which is Ginkgo biloba, and their ancient origin was contrasted with that of the comparatively recent origin of the angiosperms, whose direct ancestors cannot be traced farther back than the Cretaceous formation. Their uses from the aesthetic and utilitarian aspects were also fully dealt with.

The exhibits were: Collection of Roses from MESSRS. DICKSONS AND CO., Edinburgh (a First-Class Certificate was awarded to a new dwarf Polyantha Rose, "Blush Orleans," in this collection); and a collection of Dahlias from MESSRS. DOBBIE AND CO., LTD., Edinburgh.

HOVE HORTICULTURAL AND ALLOTMENT HOLDERS.

THE annual exhibition of this Association was held in the Town Hall, Hove, on Wednesday and Thursday, the 12th and 13th inst. There were over six hundred exhibits, and the show generally was a great success. The opening ceremony was performed by the Mayor of Hove, Alderman W. Jago, J.P., who was accompanied by the Mayoress. Much of the success of these shows is due to Councillor Edward Bull, who is Chairman of the Association.

The Association's Challenge Cup presented by Sir A. R. Sargeant, J.P., for six distinct kinds of vegetables was won by Miss HENRY. Mr. A. E. MORRIS was placed second, and Mr. E. RIDLEY third. In the allotment holders' section the best six kinds of vegetables were shown by Mr. PRUDEN, and he was followed by Mr. W. DENDY. In Messrs. Tilly's class for a collection of six kinds of vegetables, Mr. PRUDEN was again successful. The best display of plants and flowers arranged on a space not exceeding ten feet by six feet, for which a silver challenge cup was presented by Mr. Bull, was shown by Mr. W. H. VOKINS, second Mr. G. PAGET.

Several excellent non-competitive exhibits were staged. The whole of the platform in the building was decorated by Messrs. W. BALCHIN AND SONS, LTD., whilst at the opposite end of the hall Messrs. Box, of Lindfield, made a big display of hardy flowers. Gold Medals presented by the Royal Horticultural Society were awarded to Messrs. CHARLESWORTH AND CO., Haywards Heath, for Orchids; Messrs. Box, Burgess Hill, for miscellaneous hardy plants; Messrs. W. BALCHIN AND SONS, LTD., Brighton and Hove, for floral displays, and Messrs. R. WALLACE AND CO., Tunbridge Wells, for Gladioli and herbaceous plants. Silver medals presented by the Royal Horticultural Society were awarded to Mr. F. WOOLARD, Brighton, for Roses, and Messrs. J. CHEAL AND SONS, Crawley, for Dahlias.

ROYAL HORTICULTURAL.

Trial of Dahlias at Wisley.

THE following awards have been made by the Royal Horticultural Society to Dahlias after trial at Wisley:—

Single Varieties.

AWARDS OF MERIT.

Mamie, sent by Messrs. J. CHEAL AND SONS; *F. Graham Bird*, sent by Mr. W. TRESEDER.

HIGHLY COMMENDED.

Nanno, sent by Mr. W. TRESEDER.

Mignon Single Variety.

AWARD OF MERIT.

Coltness Gem, sent by Mr. PURDIE.

Paeony Varieties.

AWARD OF MERIT.

Vesuvius, sent by Messrs. VELTHUYS AND SON.

HIGHLY COMMENDED.

Wake Up, sent by Mr. H. CARLEE.

Miniature Paeony Varieties.

AWARDS OF MERIT.

Peach, *Mac*, *Crimson Glow*, and *Denys*, all sent by Messrs. J. BURRELL AND CO.

HIGHLY COMMENDED.

Leonie Cobb, sent by Messrs. J. CHEAL AND SONS; *Leonie*, sent by Messrs. J. BURRELL AND CO.

Decorative Variety.

HIGHLY COMMENDED.

Protest, sent by Mr. D. WOOLLVEN.

Small Flowered Decorative Varieties.

AWARDS OF MERIT.

Raider, *Tipsy*, both sent by Messrs. J. BURRELL AND CO.; *Juweeltje*, sent by Mr. DEN OLDER.

Pompon Variety.

AWARD OF MERIT.

Glow, sent by Messrs. J. CHEAL AND SONS.

Star Varieties.

AWARD OF MERIT.

Gatton Star, sent by Messrs. J. CHEAL AND SONS.

HIGHLY COMMENDED.

Dorking Star and *Crimson Star*, both sent by Messrs. J. CHEAL AND SONS.

Camellia Variety.

AWARD OF MERIT.

Radium, sent by Mrs. P. THODAY.

Cactus Variety.

AWARD OF MERIT.

Jhr. G. van Tets, sent by Mr. KRIEST.

Small Flowered Cactus Variety.

AWARD OF MERIT.

Snowdrift, sent by Mr. C. TURNER.

Trial of Vegetable Marrows.

The following awards have been made to Vegetable Marrows after trial at Wisley:—

HIGHLY COMMENDED.

First of All, sent by Messrs. COOPER TABER AND CO.; *Long Green Running*, sent by Messrs. WATKINS AND SIMPSON; *Green Bush* sent as *Chusan Green*, sent by Messrs. BARR AND SONS; *Green Bush*, sent by Messrs. W. NUTTING AND SONS; *King's Acre Cream*, sent by Messrs. BARR AND SONS; *Moore's Cream Striped*, sent by Messrs. W. NUTTING AND SONS; *Rotherside Orange*, sent by Messrs. W. H. SIMPSON AND SONS.

COMMENDED.

Long White Smooth, *Long Island Bush*, both sent by Messrs. WATKINS AND SIMPSON; *Custard*, sent by Messrs. W. H. SIMPSON AND SONS.

Trial of Sweet Peas.

The following awards have been made by the Royal Horticultural Society to Sweet Peas after trial at Wisley:—

AWARDS OF MERIT.

Elsie, sent by Messrs. DOBBIE AND CO.; *Annie Ireland*, sent by Messrs. ALEX. DICKSON AND SONS; *Ryburgh Lemon Picotee*, sent by Messrs. A. STARK AND SON; *Butterfly Spencer*, sent by Messrs. A. STARK AND SON; *New Miriam Beaver*, sent by Messrs. R. VEITCH AND SON; *Mrs. H. Richards*, sent by Mr. W. J. UNWIN; *John Ingman*, sent by Messrs. BARR AND SONS; *Wild Rose*, sent by Mr. J. STEVENSON; *George Shawyer*, sent by Messrs. DOBBIE AND CO.; *Liberty*, sent by Mr. J. STEVENSON; *Pimpernel*, sent by Messrs. E. W. KING AND CO.; *Bunty*, sent by Messrs. A. IRELAND AND HITCHCOCK; *Illumination*, sent by Messrs. ATLEE BURPEE AND CO.; *Thos. Stevenson Improved*, sent by Messrs. C. MORSE; *Gloriosa*, sent by Messrs. TOOGOOD AND SONS, Messrs. R. VEITCH AND SON, and Messrs. DOBBIE AND CO.; *May Unwin*, sent by Mr. W. J. UNWIN; *Charming*, sent by Mr. J. STEVENSON; *Donald McNaughton*, sent by Mr. C. ELLIOTT; *Mascotte Scarlet*, sent by Messrs. R. VEITCH AND SON, Messrs. BARR AND CO., and Mr. W. HOLMES; *Hawlmark Scarlet*, sent by Messrs. CULLEN BROS.; *Mrs. C. P. Tomlin*, sent by Messrs. W. NUTTING AND SONS; *The Cardinal*, sent by Messrs. R. VEITCH AND SON.

HIGHLY COMMENDED.

Phyllis, sent by Messrs. ALEX. DICKSON AND SONS and Messrs. CULLEN BROS.; *Mary Rose*, sent by Messrs. DOBBIE AND CO.; *John Porter*, sent by Messrs. ALEX DICKSON AND SONS, Messrs. CULLEN BROS.; *Glitters*, sent by Messrs. ATLEE BURPEE AND CO.; *Tangerine Improved*, sent by Messrs. ALEX. DICKSON AND SONS, Messrs. R VEITCH AND SON, Messrs. IRELAND AND HITCHCOCK, and Messrs. DOBBIE AND CO.; *Royal Salute*, sent by Messrs. E. W. KING AND CO., and Messrs. J. K. KING AND SONS.

DUTCH AND DUTCH-INDIAN HORTICULTURAL EXHIBITION AND SPECIAL DAHLIA SHOW AT AMSTERDAM.

IN connection with the International Horticultural Conference at Amsterdam, the Amsterdam section of the Royal Netherlands Horticultural and Botanic Society arranged an extensive flower show in a large building in Ferdinand Bolstraat, from September 14 to September 23. At the same time, and in conjunction therewith, the Netherlands Dahlia Society held its exhibition.

The display was a very extensive one, in a building about three times the size of the R.H.S. Hall at Westminster, and its general arrangement was very pleasing, as is usual in the case of a Continental exhibition. But although the effect as a whole was very fine, and numerous exhibits were delightfully designed and carried out, there were many

Digitized by Google

exhibits which fell very far short of British standards, both as regards quality and arrangement.

It would serve no useful purpose to report the exhibition in detail, therefore we shall confine our remarks to a few of the leading exhibits and some general impressions.

Dahlias were a great feature of the exhibition, and among the several sections represented the decorative varieties occupied the most space and were by far the most interesting and effective. Using the term in its broadest sense, it is not too much to state that the "decorative" Dahlias are at the moment the most popular and fashionable flowers in Holland. They were to be seen everywhere; in the shop windows of clothiers, hardware dealers, drapers, photographers, and others; in the rooms and windows of private dwellings; in hotels and restaurants; in the markets, florists' shops, and on the street-sellers' ornamental barrows; in parks and in gardens.

Mr. F. G. TRESEDER, Cardiff, was an exhibitor, and obtained a gold medal, but his display had lost its freshness when we saw it, owing to the long distance his flowers had to travel. Some of the largest and most attractive of Dahlia exhibits were those arranged by Mr. H. CARLEE, Heemstede; Mr. J. E. BALLEGO, Leiden; Mr. D. BRUIDEGOM, Baarn; Mr. F. NAGELS; Mr. P. MAJOOR, Baarn; Messrs. WAVEREN BROS., Hillegom; Mr. C. DIANEN, Rynsberg; and Mr. G. WOUTERS, Nykeirk. Among outstanding varieties were Artus, an upstanding, long-stemmed scarlet variety; the white Princess Juliana; the dark crimson Border Perfection, of fine form and large size; King of the Autumn, buff; Couronne d'Or, yellowish buff; Clothilde, deep yellow; Meisterstup, bluish mauve, a distinct advance towards the blue Dahlia, on Mr. Ballego's stand; Prince of Wales, a big decorative crimson; Yellow Perfection, rich yellow and of large size; and Harmonic, soft yellow.

British horticulture was represented also by Messrs. S. LOW AND CO., who had a small group of Orchids, in which we noted Cypripedium A. de Lairesse; Laelio-Cattleya St. George, L.-C. St. Gothard, Sophro-Cattleya Blackii and Oncidium Krameri. Messrs. SANDERS, St. Albans, contributed a larger group, wherein several specimens of the yellow Oncidium Marshallianum were very effective, arranged with Odontoglossum grande, Laelio-Cattleya Orundosi, Cattleya Acis, and other choice Orchids. A gold medal was awarded in each case.

Mr. C. W. MATTHES, Breukelen, arranged one of the finest groups of Odontoglossom grande we have ever seen; the plants were numerous, finely grown, and freely flowered; one variety had the yellow in the petals almost obliterated by the brown colour. The gold medal awarded was well deserved.

Mr. C. ENGELMANN, Saffron Walden, contributed a fine and large display of Carnations and secured the highest honours; the varieties showr were those familiar to British visitors to shows—Tarzan, Enchantress Supreme, Saffron, and others.

The display made by Messrs. C. E. VAN TUBERGEN was particularly pleasing; it was a little mossy dell with groups of Colchicum giganteum, C. autumnale, and C. Bornmuelleri; and little groups of the dwarf Begonia Flamboyant, a very pretty crimson-scarlet variety. There were dwarf late-flowering border flowers also arranged pleasingly, with a background of shrubs and tall flowers.

Messrs. LOM BROS. contributed a grand lot of Ferns, beautifully arranged; the principal sorts were Adiantum Farleyense Glory of Nordrecht and Nephrolepis Roosevelt var. plumosum.

A combination of the Westland growers, who cultivate fruit on an extensive scale, provided one of the largest exhibits in the show, and also one of the most wonderful, but, alas! not one of the handsomest. The splendid fruits were disposed on an almost flat surface, on white paper over cotton wool, and they were set out in formal fashion, mostly in semi-circles. The Grapes, fine bunches, were chiefly of the Muscat of Alexandria, Black Hamburgh, Lady Hutt, Alicante, Gros Colmar, and Emile Royal varieties; the most notable Pe rs were Pres. Roosevelt and Callebasse; and the best Apples were Salome, Emperor Alexander, Bismarck, Lane's Prince Albert, and Allington Pippin. In addition to these fruits there were dozens of netted and Canteloupe Melons, Tomatos, Capsicums, Plums, and Aubergines.

Another large, interesting, and beautiful exhibit was made by the Aalsmeer growers, and consisted almost entirely of huge vases of fine blooms of Mrs. Pulling and Rayonnante Chrysanthemums; the latter was represented by the ordinary pink variety and white and bronze forms.

In a display of fruits arranged by the PROVINCIAL COMMISSION, numerous very clean examples of Pears and Apples were displayed; among the former the fruits of Williams' Bon Chrêtien and Beurré Hardy attracted attention, while the principal Apples were Transparent de Croncels, Manks Codlin and Keswick Codlin; the fruits were packed in boxes, and the boxes of choice Pears were compartmented like egg-boxes. Some fruiting Vines in pots from another exhibitor were below British standards of quality.

Fifty boxes of fruits from Mr. J. A. HEUFF, Walstraten, were of good average quality, and indicated the varieties of Apples and Pears grown for market; the best Apples were Transparent de Croncels (a great favourite), Grenadier, Dutch Bellefleur, Cox's Pomona, and Cox's Orange Pippin; the best Pears Beurré d'Amanlis and Le Lectier. This was a well-packed collection.

Roses were displayed by several exhibitors, but, as a rule, the arrangements were too sparse to be really attractive. Messrs. GRATAMA made a feature of Ophelia in a big bowl. Messrs. KOSTER AND CO. exhibited Koster's Orleans; Corry Koster, orange; and Daisy, deep crimson, all dwarf polyantha varieties.

Mr. TEEUWSEN, Oosterbeek, contributed a Rose garden; instead of plants he used vases of flowers partly bedded in cocoanut fibre, but, while the idea was good, the effect was poor; plants of Golden Ophelia in flower, trained against a low trellis, provided the most charming picture in the display.

Coleuses were shown somewhat freely, reminding us of shows at home in bygone years; in some groups very large specimens with brightly coloured foliage were exhibited, and they attracted a great deal of attention. Similarly interesting were the fine examples of Dieffenbachias, Dracaenas, standards of Cissus discolor, pans of Selaginellas, and the trailing Rubus moluccanus, an attractive basket plant known in many gardens as R. reflexus, and formerly used with some freedom on the Continent in floral arrangements, because of its velvety green leaves. This exhibit was by Mr. PAUL MAY, Diest, who, we understand, is an amateur horticulturist. Messrs. LEMKER AND SONS contributed a few giant tree Ferns—Cyathea medullaris—big Nephrolepis and large Adiantums, while Messrs. HARTMAN, of Ghent, sent tall specimen Bays and Euonymus.

In a large case or small greenhouse the CURATOR OF THE AMSTERDAM BOTANIC SOCIETY exhibited a few Nepenthes, some excellent examples of the showy Macodes petola, Drosophyllum lutescens, Myrmecodia echinata, Dionaea muscipula, and a small set of Bertolonias. A gold medal was awarded.

Groups of good strains of Cyclamen, of Rex Begonias, and Primula obconia were disposed where their colouring harmonised with the surroundings, and these gave point to the general design of the show.

Exhibits from the Dutch-Indian colonies were large in extent and of great interest. Large beds of economic plants grown in Surinam, Java, Borneo, and New Guinea were planted, and behind these were large native-built huts or shops for the display and sale of fruits and roots imported from the Dutch East Indian possessions. Coffee, tea, Breadfruit, Citrons, Oranges, Bananas, Yams, cocoa, Granadillas, rubber, various fibres, Rice, Vanilla, Colocasia esculenta, Maize cobs, Palm nuts, and other subjects were displayed, usually in native receptacles, but in some instances in the cases as received.

TRADE NOTES.

THE Minister of Agriculture addressed the following letter to the Secretary of the National Farmers' Union of Scotland on September 3, in answer to correspondence on the question of the Agricultural Tribunal's recommendation that imports of foreign Potatos be permitted only under general licence.

"In reply to your letters of August 11 and 28 with regard to the import of foreign Potatos into this country, I would remind you that this question was very fully discussed at a deputation which I received on July 17 last of English and Scottish farmers and Potato growers, including Mr. Alexander Batchelor, the Vice-President of your Union, and, as I then explained, it would be impossible to secure the necessary Parliamentary sanction this year to your proposal for the restriction of imports of foreign Potatos. I then stated that the Cabinet had given the matter careful consideration and had decided not to propose legislation at the present time to empower the Government to prohibit the import of Potatos from overseas.

"With regard to the low prices realised for Potatos in 1922, while imports of Dutch Potatos may have caused the fall in prices last summer to have been more rapid than might otherwise have been the case, there can be no doubt that the main cause of the slump was the abnormal yield of home-grown Potatos. A total production of about 4,000,000 tons from the agricultural holdings of Great Britain is sufficient for the country's needs, whereas the total production last year was about 5,200,000 tons. The total imports from foreign countries into Great Britain and Ireland in 1922 were 171,500 tons, or only 3½ per cent. of the total production of Great Britain alone, and of these 98,000 tons were early Potatos from France and the Channel Isles which are not generally considered to be competitors with the home-grown crop. Only 35,800 tons came from Holland, and practically none came from that country after August, so that it cannot be seriously contended that imports from Holland kept prices at the very low level at which they remained throughout the season.

"Turning to this year it is true that the total imports up to date show an increase over 1922, but this has been entirely due to the large increase in imports of quite early Potatos from France and the Channel Isles; the imports from Holland have so far proved below the figures for the corresponding period last year. Whereas 7,274 tons arrived from France in the week ending August 4, the import in the week ending August 25 had declined to 452 tons, from which it may be presumed that the French supply is now practically exhausted and was of the early variety.

"In addition the area under Potatos for human consumption in Holland is officially reported to be 20 per cent. less than last year, while the yield per hectare is expected to be lower.

"The Dutch exchange also is against this country, and this in itself would have a deterrent effect in purchasing Potatos from Holland. In fact the imports from Holland up to date ought not to have had any appreciable effect on the price of the British new crop, unless, as has been suggested, growers have been frightened into taking lower prices by reports of large supplies of Dutch Potatos being available or likely to become available at a low price. It is significant that last week it was reported at Hull market, an important market for Dutch Potatos, that the supply was practically finished and that this week no quotations were given.

"In your letter of the 11th and the accompanying resolution it was suggested that growers were expecting serious losses again this year but the trend of prices up to date does not appear to confirm that contention. In the wholesale markets of England and Wales prices last

Digitized by Google

week for first quality Potatos averaged £7 11s per ton for Duke of York and £7 16s. for Sharpe's Express, while King Edwards were £9 per ton, whereas in the corresponding week of last year average prices for the same varieties were £5 16s., £4 and £4 16s. 6d. per ton respectively.

"Similarly in Scotland wholesale prices realised in the week ending August 22 for first quality Potatos were from 70 to 100 per cent. higher than for the corresponding week last year, e.g., first earlies at Edinburgh and Glasgow were £7 and £6 13s. per ton respectively, and £4 and £3 5s. per ton in 1922. The free on rail prices to producers both in England and Scotland show an even larger increase over last year's figures, e.g., at Wisbech, King Edwards were making £7 to £7 10s. per ton f.o.r. for the week ending August 29, against £2 10s. to £3 a year ago, and these prices are rather higher than the prices for the previous week, while last year at the same time prices were still declining. In Edinburgh first earlies were quoted at £5 5s. to £6 per ton on rail, compared with £2 to £2 7s. 6d. per ton on rail at the same time in 1922. Again, Dutch Potatos which were only on offer in two markets, Bristol and London, last week were realising £7 to £7 10s. per ton, which is very little below the rate for the best British early varieties.

"A further important factor in the Potato situation is that the area under Potatos in Western Europe is generally lower than the area last year, while a lower yield is also anticipated. In England and Wales the acreage under Potatos has declined by over 94,000 acres (17 per cent.), and although the figures for Scotland are not yet available, it is thought that they will also show a decline.

"It has been suggested that, owing to the depreciated currency, German Potatos are reaching this country via Holland, consigned as Dutch, and that this might cause a serious depression of the British price. I have made inquiries on this point and find that the export of Potatos from Germany is entirely prohibited, so that there can be no question of any danger from such a source.

"In general I think that there is good reason to suppose that the fears of a serious loss again occurring in the Potato-growing industry this year are much exaggerated."

Ministry of Agriculture and Fisheries,
10, Whitehall Place, S.W.1.
September 12, 1923.

On the two Fridays, September 14 and 21, members of the nursery trade visited Messrs. Stuart Low and Co.' new nurseries at Jarvis-brook, Sussex, where the Orchids, Carnations, fruit trees and Roses were inspected. After a light lunch the itinerary included a 20-mile trip to the farms of upwards of 400 acres recently acquired by the firm for development, partly into nurseries, although fewer than 30 acres are yet planted with fruit stocks or growing maiden trees. Not the least interesting portion of the new nursery is a trial plantation of nearly every variety of fruit grown by the firm. Keen interest was displayed in a bed of the various fruit tree stocks standardised by East Malling, and although the firm have grown some of these for many years they now have established stool beds of stocks obtained from East Malling under their various numbers. Different Plum and Quince stocks are also grown in the same way. Tea at the Bull, Benenden, and another 20-miles motor run brought the parties to Tunbridge Wells in time to catch the 8 o'clock train to London.

ABSTRACT PUBLISHED THIS MONTH.

Spray Producers. Patent No. 201396.—Mr. A. J. Fletcher, of Kentish Engineering Works, Maidstone, Kent, has invented an efficient nozzle for spraying apparatus, in which a whirling spray is produced. The sprayer is being manufactured particularly for use on fruit trees, etc. The tube through which the liquid is forced is provided at its outer end with an elbow-piece, in which is mounted a spraying-plate pressed towards the outlet by a spring. An ingenious device for adjusting the relative positions of the spraying disc and outlet in order to vary the character of the spray is provided.

This list is specially compiled for *The Gardeners' Chronicle* by Messrs. Rayner and Co., Regd. Patent Agents, of 5, Chancery Lane, London, from whom all information relating to Patents, Trade Marks and Designs can be obtained gratuitously.

Messrs. Rayner and Co. will obtain printed copies of the published specifications and abstract only, and forward on post free for the price of 1s. 6d. each.

THE WEATHER.

THE WEATHER IN AUGUST.

THIS formed the third consecutive wet August, and during the first three days, and from the 15th generally until the close, it was also remarkably stormy. Winds from either south, south-west or west prevailed during no fewer than 550 hours, their normal duration being exceeded by 190 hours. The daily range of temperature was therefore exceptionally small. During the quiet spell from the 4th to the 14th the weather was, however, mainly warmer than usual; but the latter part of the month was much cooler. Altogether, the mean temperature equalled 58.9°, or merely 0.3° below the average. There was also, fortunately, very little lack of sunshine, 175 hours being recorded, or only 6 fewer than the normal number. Visibility was particularly good, and ozone plentiful. Rain, however, fell on 22 days, or 6 more than usual, and the total amounted to 4.73 inches, which implies an excess of 1.17 inch. Strong gales occurred on the 3rd and 29th to 30th, and moderate ones on three other days. The onset of the principal storm was very remarkable; at 9 p.m., G.M.T., on the 29th, the wind rose from a dead calm to a mean velocity of 51 miles per hour, in a few minutes, and remained of gale force for 14 hours afterwards. Brief thunderstorms were experienced on the 21st, 22nd and 29th. Hail fell on the 22nd. There was no fog. *Joseph Baxendell, The Fernley Observatory, Southport.*

THE WEATHER IN SCOTLAND.

THE outstanding feature of the weather record for August was the exceptionally high rainfall, temperature and sunshine being practically normal. There were only 11 days entirely free from rain during the month, and never more than 3 of these successive. The total amount collected was 4.83 inches, of which 1.10 inch fell on the 20th—the wettest day. Bright sunshine made a record of 157.9 days, being an average of 5.1 hours per day, and a percentage of 33; there was no day in the month on which the sunshine card was unmarked. Barometric pressure was low, the mean being 29.86 inches, the highest 30.24 inches on the 14th, and the lowest 29.09 inches on the 21st.

The mean temperature was 57.5 degrees with a mean maximum of 65 degrees and a mean minimum of 50 degrees. The highest maximum was 76 degrees on the 13th, falling to 52 degrees at the end of the month, while the lowest minimum of 40 degrees was recorded for the 25th and 29th. On the grass, with a lowest of 37 degrees on the 25th, the mean minimum was 46 degrees; for the past 3 months there has been no ground frost—an exceptional feature. At 1 foot deep the soil temperature rose steadily from 57 degrees to 60, and then fell steadily to 55 degrees. Dew fell on 10 nights. The prevailing winds were from the west and south, frequently high, with a gale on the 21st.—JOHN DAVIDSON, *Director of Studies, the Training College Gardens, Mayfield, Dundee.*

GARDENING APPOINTMENT.

Mr. Cyril Sprackling, for the past three years and nine months Foreman at Crichel Gardens, Wimborne, Dorset, as Gardener to Captain H. C. NOEL, at Cutmose, Oakham, Rutland.

ANSWERS TO CORRESPONDENTS.

CORRESPONDENCE SCHOOL OF HORTICULTURE: *A. J. F.* The addresses of persons willing to coach horticultural students by correspondence may be found in our advertisement columns from time to time.

GARDENING APPOINTMENT: *L. D.* Seeing that you are fairly successful with the practical side of your profession, we advise you to attend some Polytechnic in which you could improve your education and scientific knowledge of gardening. With regard to employment at Kew, you should make application to the Curator for the necessary forms, and at the same time state your experience and qualifications.

GREEN SCUM ON HARD COURT: *J. G.* The green scum which is doubtless caused by the growth of an algae, appearing after rain, points to the court being insufficiently drained. During the winter you might open a trench or two with the object of draining the court. In the meantime you might get rid of the algae growth by the use of a weed killer or, as there is nothing that would be injured, one of the stronger acids, such as sulphuric acid or hydrochloric acid, might be used.

LIVERWORT ON LAWN: *M. M.* The black stuff you send is not a fungus but one of the thalloid Liverworts (Hepaticae), and allied to the Mosses, of which some was also sent in the box. Many of the Liverworts grow in woods and on heaths, but a few of them come into the garden and live in damp shady places. The reason for its jelly-like character in August is because it is one of the species which make their growth in summer, and the rain then made it gelatinous or greasy. The grass sent with it was very poor or weak, and no doubt the soil is sour. Newly slaked lime mixed with some sifted soil and used as a dressing in November and again early in March would correct the acidity of the soil and help the grass to grow. Though lime may not kill the spores, it is more likely to do so than a dressing of lawn sand, or one ounce of finely powdered sulphate of ammonia to the square yard would kill the Liverwort when it is young and fresh, before spores are produced. Either of these substances would also stimulate the grass. The drip from, and the shade of fruit trees favour the growth of Mosses and Liverworts. Frequent hoeing of the flower borders in dry weather would prevent the growth of these low members of the vegetable kingdom, because they must be attached to firm or compact soil in order to get the necessary moisture.

MELONS GROWING ONE-SIDED: *T. T.* The Melon fruit had only a very few seeds and scarcely any on the side that was malformed, pointing to imperfect fertilisation.

NAMES OF FRUITS: *A. J. S.* 1, Blenheim Pippin; 2, Yorkshire Greening; 3, Small's Admirable; 4, Golden Harvey (syn. Brandy Apple); 5, Lane's Prince Albert; 6, Newton Wonder; 7, Bismarck; 8, King of the Pippins.

NAMES OF PLANTS.—*Correspondent, Belfast.* 1, Cupressus Lawsoniana; 2, Thuya dolabrata; 3, Cupressus obtusa; 4, Cupressus Lawsoniana var.; 5 and 6, Thuya plicata; 7, Cupressus Lawsoniana var. densa gracilis; 8, Populus tremuloides; 9, Ruta graveolens; 10 and 11, not recognised; 12, Helxine Soleirolii. —*G. E. M. a*, Geranium striatum; *b*, probably *G. pratense*.—*G. J. W.* Campanula Portenschlagiana.—*G. S.* Statice tartarica. — *D. G.* Epilobium angustifolium. — *W. B. H.* Ammi majus.—*L. S. A.* Rumex Acetosella (Sheep Sorrel).—*H. H.* 1, Cotoneaster frigida; 2, C. Simonsii; 3, Thuya orientalis.—*Firs.* 1, Pinus excelsa; 2, Elaeagnus pungens var. variegata; 3, Cupressus pisifera var. squarrosa; 4, Abies Pinsapo; 5, Pinus muricata; 6, P. sylvestris; 7, Cedrus Deodara; 8, Cupressus Lawsoniana var. pendula gracilis.—*W. H. W.* 1, Olearia Haas-

Digitized by Google

tii; 2, Anaphalis margaritacea; 3, Senecio tanguticus; 4, Aster acris; 5, Thalictrum minus; 6, Physostegia virginiana; 7, Lythrum Salicaria. *N. S.* Origanum majoranoides, closely allied to O. Majorana, but more silky and having smaller leaves. *H. F.* Datura Stramonium.—*F. W. B.* Eupatorium cannabinum (Hemp Agrimony).—*J. E. M.* We cannot undertake to name Roses; send specimens to a Rose grower.

PEACH LEAVES FALLING: *L. C. B.* The dried leaves you send have the appearance of being infested with red spider, which no doubt has accumulated during the ripening of the fruits and in the absence of syringing. In future directly the fruits are gathered, thoroughly spray the trees with a suitable insecticide, but endeavour to keep the leaves green so long as possible. Possibly the roots were allowed to become dry also.

RHODODENDRONS FOR SANDY SOIL: *D. D.* As the Rhododendron plants failed to succeed in your sandy soil, it will be necessary for you to prepare special soil for them. Take out a considerable amount of the sandy material and substitute a mixture of peat, leaf mould and good turfy loam. If you replant the long, straggling specimens, allow them to remain for a season and then cut them back, when they will probably break into growth at the base and make more shapely specimens.

SHANKING IN GRAPES: *E. A.* Without inspecting the borders we can only suggest that you have over-cropped the vines. In future crop the vines lightly, thin the bunches early and endeavour to obtain strong, well-ripened wood, cutting back the leading growth each season for a year or two to obtain strength in the vine.

STREET TREES: *Forest Trees.* There are numerous trees suitable for street planting, including the Plane, Poplar, Horse Chestnut, Lime, Mountain Ash, Acacia, White Beam, Ailanthus, Jersey and Cornish Elms, and Laburnum. With regard to mixing varieties, we know of a very attractive street which is planted with Golden Poplars and Prunus Pissardii arranged alternately, and another pretty combination in the same town is Silver Birch and Mountain Ash. The difficulty with mixed plantings is that one of the subjects is liable to grow more vigorously than the other. Horse Chestnut would be suitable for an avenue with little traffic, but we do not advise the planting of the Oaks you mention. The small flowering trees should be set about thirty-five feet apart, while the larger kinds need to be set from fifty to seventy feet apart. You will find an article on "Trees for Street Planting" in *Gard. Chron.* June 23, 1923, p. 352.

THE MARKING OF HARD TENNIS COURTS: *J. J.* The best method of marking out shale tennis courts in a satisfactory manner is undoubtedly a difficult question to decide, especially in public parks where so many different opinions exist among players. In the case of En-tout-Cas courts special tapes are generally provided for the purpose. Play-lines formed of wood on cement blocks are frequently used, but are not popular with expert players. The shale tennis courts in the Manchester parks are marked out with whitening just in the same way as grass courts. Whenever possible this is done with the ordinary type of tennis marker, but when this is not practicable, then it is done by hand by means of a garden line and a whitewash brush. Generally, if the shale on the play-lines is well damped before the whitening is applied, the grit will not pick up and a mechanical marker will do the work quickly and well. A new type of marker suitable for shale courts has recently been placed on the market. The wet whitening in this case is blown on to the play-lines by means of compressed air, instead of being laid on with a wheel, as is done by the ordinary marker. We have not had sufficient experience of this machine to be able to say whether or not it is likely to prove the success that its inventor anticipates.

REMARKS.—Fair supplies of produce have been available during the past week, but with the exception of a firm inquiry for Worcester Pearmain Apples and Monarch Plums, the demand has only been moderate. Heavy shipments of Plums from California now arriving are probably too late to influence prices of the remainder of the English crop. Grapes have eased slightly in price, owing probably to increased consignments from Holland and Belgium; the value of Peaches, Melons and Figs remains at a fairly level rate. Large cooking Apples are a good trade, but the proportion of first-grade fruit arriving is small. Shipments of Apples from the Continent and America show an increase, and prices have receded slightly. The Tomato trade has been extremely slow, arrivals from all sources being heavy and the demand poor at almost any price. At the time of writing the prospects are brighter. Trade in Cucumbers has also been depressed, brought about probably by the large quantity of Tomatos on offer. Forced Mushrooms have been a bright feature, prices for these being firm. Beans and green vegetables have been abundant and cheap. Inquiries for Potatos are dull.

REMARKS.—Chrysanthemums have become the chief feature in this department, and numerous varieties are on sale. All disbudded blooms are in excellent conditions. A few exhibition blooms are also being offered. Although trade has not been very brisk during the past week, supplies of many subjects were insufficient for all requirements on Friday and Saturday last. Lilium longiflorum in particular, which has become suddenly short, experienced a big rise in prices, which has been maintained up to this morning. L. lancifolium is also selling freely at increased prices. Richardias (Arums) are arriving in better condition and receiving more attention from buyers. Carnations and Roses are gradually shortening in quantity; better quality blooms of the former are now on sale. Choice white blooms, such as Lapagerias, Stephanotis and Gardenias, are scarce. Small consignments of Lily-of-the-Valley are being sent from Holland, there being fewer of these flowers from home growers, the latter grown being preferred, as the quality is much finer. Michaelmas Daisies are making a good show, the variety King George receiving most attention. Single Violets are more plentiful and in much finer condition, the cooler weather being more suited to them. Physalis is arriving in first-class condition, and best quality spikes are soon cleared. There is a fine selection of autumn foliage, which is now in demand for harvest festivals.

SCHEDULES RECEIVED.

The Society of the Four Northern Counties Fruit Show and Congress.—Ninth fruit show and congress, to be held in the Market Hall, Durham City, on Wednesday and Thursday, October 10 and 11.—Secretary, Mr. A. Rawson, Western Lodge, Durham.

Brighton, Hove and Sussex Horticultural Society.—Chrysanthemum show, to be held in the Dome and Corn Exchange, Brighton, on Tuesday and Wednesday, November 6 and 7, 1923.—Secretary, Mr. H. J. Bingham, 60, Richmond Street, Queen's Park, Brighton.

CATALOGUES RECEIVED.

WM. CUTBUSH AND SON, LTD., Barnet Nurseries, Barnet.—Roses; Michaelmas Daisies.

SAMSONS, LTD., Kilmarnock.—Roses; Bulbs and Flower Roots.

The Advance of Knowledge of Fungous Pests.

It is not often that the student of science reads such an arresting passage as that contained on p. 168 in the citation from the *Gardeners' Chronicle* seventy-five years ago. Perusing it the mind is carried back the better part of a century and may contemplate with philosophical interest the disputations which ranged round the birth of new knowledge. In those days the now universally accepted fact that fungous parasites are responsible for many of the most serious diseases of plants was the subject of surmise and dispute. The pioneers—de Bary in Germany, and Miles Berkeley in this country—had already, at the time of which we write, produced evidence which was ultimately to prevail in favour of the view that plant disease is often caused by specific fungi. But there is a long lag in the prevailing of truth, and the older school of scientists and horticulturists opposed a stout resistance, or what is worse, a bland indifference to the discoveries of their contemporaries. How marked must have been the indifference on the part of men of science to Berkeley's discoveries is indicated by the fact that although he began publishing the results of his researches in these pages in 1854, his merits were so unrecognised in scientific circles that in 1863, when he received a Royal Medal from the Royal Society he had not been elected to a fellowship of that society. Horticulturists likewise displayed for a long time a tenacious disbelief in the parasitic nature of such plant diseases as late blight of Potatos, mildew of vines, etc. Confronted with the universal presence of a specific fungus in or on the tissues of a diseased plant, they argued that the fungus was merely a scavenger alighting and battening on the tissues after they are dead. Gradually, however, the experimental evidence in favour of the theory of fungus parasitism became too strong to be ignored. So early as 1847 Berkeley described the vine mildew, Oidium Tuckeri, which had attacked with disastrous results the vines in Mr. Tucker's nursery at Margate, and had persuaded him to apply sulphur as a remedy. The success which attended this method of treatment must have had a profound effect in modifying the opinions of contemporary horticulturists. In those middle years of last century, late blight of Potatos was peculiarly prevalent, and the knowledge that its occurrence is invariably associated with the presence of the fungus Phytopthora infestans undoubtedly helped gardeners to recognise that in parasitic fungi they have some of their worst enemies. But the main credit for their conversion, at all events so far as British gardeners are concerned, rests with Berkeley, who for thirty years—from 1854 until 1884—wrote regularly and vigorously in these pages on the subject of fungi and their pathogenic activities. Yet in spite of the vast body of knowledge which has been built up by successive generations of investigators on the foundations so surely laid by Berkeley, the diseases are still with us and still take a vast annual toll of the produce of farm and garden. To combat them requires unceasing vigilance and large outlay in spraying outfit, fungicides and labour. The impatient may find in the fact that preventive measures are even at the present day but crude, ground for complaint against the investigators who work at life histories of pathogenic fungi and propound remedies for their destruction. But to those who see things in a truer light, it is by no means a reflection on the ability and assiduity of mycologists that their labours have not been able to exterminate our fungous pests. For the soils and the climate of this country are of endless variety, and plants have to be grown not only under ideal and perfect conditions, but under average conditions. Hence it is that their fungous enemies have ample opportunity for renewing their attacks year after year. They have also the advantage of "getting their blow in first"; for it is impossible, or all but impossible, to adopt preventive measures against every kind of potential pest, and only too often when in circumstances of weather and soil favourable to it the fungous parasite has taken hold of a crop, it is too late to save the plant. The wise gardener, however, much as he may feel harassed by the numerous prescriptions which he is urged to try, does not refuse to keep abreast of the advance in knowledge of fungous diseases. He learns all that there is to be learned about these enemies of garden and orchard, and uses his judgment as to the adoption of means of combating them. Best of all means is still, as it always has been, good cultivation. Doubtless in the future the plant breeder will provide us with immune of resistant strains of plants which will each be proof against the several diseases which now attack them. But it is a far cry to that happy day, and in the meantime gardeners must perforce be content to seek always to improve their cultivation, to learn more of the peculiarities of their soil, to grow chiefly those varieties which do best in their several districts, and to adopt, when epidemics promise, those remedial measures, which mycologists have devised for the control of fungous pests. Nor, if they view the story in fair perspective, can they withhold admiration for the unceasing labours of the long line of British mycologists, the first of whom was Berkeley, who have elucidated and are elucidating the dark ways of these enemies of the cultivator and of his plants.

Imperial Fruit Show Conferences.—In conjunction with the Imperial Fruit Show to be held at Belle Vue Gardens, Manchester, from October 26 to November 3, a series of conferences has been arranged. The programme is as follows:—On Monday, October 29, at 2 p.m., Mr. H. Goodwin, Manchester, will preside, and the subject of "The Commercial Storage of Apples and Pears" will be discussed; a representative of Messrs. J. and E. Hall, Ltd., will be in attendance to answer technical questions. On Tuesday, October 30, at 2 p.m., Mr. H. V. Taylor, Deputy Controller of Horticulture, will preside, and an address on "The Manuring of Fruit-Tree Plantations" will be given by Mr. T. Wallace, of the Research Station, Long Ashton, Bristol. In the evening, at 7 p.m., Mr. R. G. Hatton, East Malling Research Station, will lecture on "Fruit Growing in Small Gardens." On Wednesday, October 31, at 2 p.m., Mr. W. G. Lobjoit, Controller of Horticulture, will take the chair, and the subject for discussion will be "The Marketing and Distribution of Fruit." The National Federation of Retail Fruiterers will move a resolution relating to the marketing and distribution of fruit, and the delegates of the National Farmers' Union, Federation of British Growers, and National Federation of Fruit and Potato Trades' Associations will join in the discussion. On Thursday, November 1, at 7 p.m., Mr. W. Herrod Hempsall, Technical Adviser in Beekeeping to the Ministry of Agriculture, will lecture on "Beekeeping," while at the meeting on Friday, November 2, "The Dietary Value of the Apple" will be discussed

Proposed Show at Southport.—The question of holding a floral fête on up-to-date lines, and evening water carnivals on a very large scale in Southport next summer, is under consideration. Southport is well adapted for a show of this description; in fact, the town has been known for a long time as "England's Seaside Garden City." It is eighteen miles from Liverpool, and less than an hour's train journey from Manchester. It has a population of over 70,000. At a well attended meeting of representatives of the horticultural trade held on the 27th ult. there was general agreement that a floral fête and water carnival should be held at Southport during three days in the last week in August and that Victoria Park would be an excellent site for the fête. The Mayor and Mayoress entertained the representatives to tea in the Mayor's parlour and the Mayor presided at a dinner given to those present during the evening.

Famous Woods for Forestry Commission.—For some time past negotiations have been proceeding between the Duke of Richmond and Gordon and the Forestry Commissioners for the purchase of the famous and extensive forest land of Glenmore, Strathspey. The final details are now being adjusted, and the bargain is expected to be completed very shortly. Glenmore has about 3,000 acres of plantable land, and is admirably adapted for, and intended to be utilised as, a nursery. With an altitude of over 1,000 feet, Glenmore forms part of the old Caledonian forest, and its Scots Firs have always been ranked as among the finest grown in the country. Time and again magnificent specimens from this forest area have been on view at forestry exhibitions, where their great height and circumference have evoked warm admiration. It was to Glenmore, one of Morayshire's fairest spots, the Government sent during the

Digitized by Google

war over 300 Canadian woodmen to cut down the standing timber. There, for over 18 months, they cut, milled and transported millions of cubic feet for service overseas. It may be recalled that a speech made at Glenmore to the Canadian woodmen by Mr. Lloyd George, caused some bitter feeling among natives of the district, which for generations has been a nursery for foresters. Mr. George, in commending the Canadians' labours, said they had given an object lesson to our woodmen in the way of felling trees, and that prior to their coming from Canada, the position in this country was to wait for the first gale of wind to blow down the giant Firs! The resentment felt among Morayshire foresters was somewhat keen, for as a matter of fact these men had forgotten more about tree-felling than many of the Canadians had ever learned; indeed, many of the latter had never wielded axe or saw until they began operations on the woods of Glenmore.

Manufacture of Walking-Sticks as a Rural Industry.—In the September issue of the *Journal* of the Ministry of Agriculture there is an interesting article dealing with the "Manufacture of Walking Sticks as a Rural Industry," contributed by the Rural Industries Intelligence Bureau. The industry is considered to be particularly well suited to many partially disabled ex-Service men, especially where they need a country life or are unfitted for employment in urban industry. We gather from this article that the English natural-stick cutter will find his chief source of supply in such subjects as Ash, Aspen, Birch, Blackthorn, Cherry, Sweet Chestnut, Crab, Elm, Furze, Hazel, Holly, Hornbeam, Maple, Mountain Ash, and Hawthorn. When the roots have sufficient size or characteristic shape to form handles or knobs, the saplings are used, but sometimes, also, the small branches of larger trees. Particulars regarding methods of drying, peeling, and shaping the sticks are given, and we commend the article to the notice of partially disabled ex-Service men who have had horticultural or forestry experience.

Rose Trials at Bagatelle, 1924-1925.—M. Forestier, Superintendent of the Parks and Promenades of Paris, informs us that trials of new Roses will be held at Bagatelle, during the coming season of 1924-1925, as in previous years. All new Roses sent for trial should, so far as possible, have been raised in pots and at least five specimens should be sent before April 30, 1924. At the same time a note should be sent stating the name, origin and parentage of the variety and any special treatment required for it. The plants will be put out as soon as they reach Bagatelle and will remain there until the month of October, 1925, so that the judges may be able to study the growth and flowering of the plants during two seasons. All letters concerning the Rose trials should be sent to Le Conservateur des Promenades de Paris, 4, Route du Champ-d'Entraînement, par Neuilly (Seine), Paris; and the plants forwarded to Roseraie de Bagatelle, Bois de Boulogne, Neuilly-Porte-Maillot Station, Paris.

Scarcity of Roman Hyacinths.—There is a great scarcity of white Roman Hyacinths this season, and growers in this country are experiencing a difficulty in obtaining bulbs. The scarcity is chiefly owing to unfavourable weather in the Ollioules district of France this year, where the bulbs are principally grown, and the crop proved a very poor one, so that no British bulb firms have received anything like their usual supplies. A prominent member of the bulb trade informs us that for years past the supplies of white Roman Hyacinths have been decreasing, and in consequence prices have risen so much that at the present time Roman Hyacinths are scarcely worth the money asked for them. In view of this it may be useful to readers to know that specially prepared Dutch Hyacinths are very suitable for early blooming and are an excellent substitute. The bulbs are taken up out of the ground very early in the season and subjected to artificial warmth, thus giving the bulbs the character of those ripened off early under a hot sun. These specially prepared Hyacinths may be flowered extra early, and a succession of bloom be easily obtained during January, forming a decoration far superior to that obtained from Roman Hyacinths. The best sorts are l'Innocence and Arentine Arendsen (white); Lady Derby (pink); Gertrude (rose); La Victoire (rose-crimson); Garibaldi (crimson); Lenotel (light blue); Dr. Lieber (bright blue); Marie (dark blue); and Yellow Hammer (yellow). The authority referred to states that he would not be surprised if in a comparatively few years the French Roman Hyacinth is a flower of the past and, in his opinion, one which will not be missed.

Dr. W. F. Bewley.—A native of Northumberland, Dr. W. F. Bewley graduated at Durham University and finally obtained the degree of Doctor of Science. Being keenly interested in all matters pertaining to the scientific aspects of agricultural and horticultural matters, he became attached to the Rothamsted Experimental Station and later became Director of the Experimental and Research Station at Cheshunt in Hertfordshire, an extremely useful Institution of special service to the large number of growers in the Lea Valley, and financed by them through

DR. W. F. BEWLEY.

the Nursery and Market Garden Industries' Development Society. The principal function of the Research Station is to study the many problems connected with the cultivation of crops under glass and to conduct experiments with a view to increasing the output of the crops most cultivated in the district. The problems also include those of crop management and manurial treatment, as well as the identification of diseases and pests and the giving of advice for their prevention and cure. Dr. Bewley has investigated successfully many plant disease problems, principally in connection with the Tomato, and has written numerous scientific papers dealing with these matters. At the present moment he has a book in the press entitled *Diseases of Glasshouse Plants*, which is to be published by Messrs. Benn Bros. Dr. Bewley is convinced that complete co-operation between the practical grower and the scientist will lead ultimately to the solution of many horticultural problems which at present are shrouded in mystery, and fortunately he has won the confidence of the many keen business men who have made the Lea Valley famous as a great horticultural producing centre.

Distribution of Surplus Pedigree Fruit Tree Stocks at East Malling.—A distribution of surplus fruit-tree stocks and varieties of soft fruit true to name, has again been sanctioned by the Executive Committee of the East Malling Research Station, under the following conditions: (*a*) Stocks, bushes, etc., are to be distributed on the understanding that they will be used for stool-bed purposes, or for propagation by cuttings, etc.; (*b*) to ensure this, they will only be distributed in small quantities and at the prices fixed by the committee (and forwarded on application); (*c*) applications for such material must be to hand by November 10, 1923, and the distribution will take place as early as possible during December, 1923, and January, 1924; (*d*) applications from subscribers to the Building Fund of the Station to have priority; (*e*) all applications to be addressed to The Secretary, East Malling Research Station, East Malling, Kent.

The Oldest Botanic Gardens.—A writer in the *Gartenwelt* (Berlin) draws attention to the fact that, although in ancient times collections of plants existed which could be considered to be the equivalent of the modern botanic gardens, the range of the plants must have been very limited before the discovery of America or the opening up of the continent of Africa. In the sixteenth and seventeenth centuries, however, the movement towards botanic gardens was rapid, and in 1560 there were already fifty of such gardens in Italy, the first, at Pisa, having been founded in 1543. The one at Padua was founded in 1546, and is the oldest still existing in the world; it contains a "Chaste tree" (Vitex Agnus-castus) said to be 370 years old. The garden at Bologna was founded in 1568, and those at Rome and Florence were commenced about the same time, while the one at Leiden, the famous Dutch University town, dates from 1575.

Sweet Pea Trials in 1924.—The National Sweet Pea Society is making arrangements for the holding of a trial of new Sweet Peas during the forthcoming season and raisers and distributors who wish to send seeds of new varieties for these trials should communicate at once with the Secretary, Mr. A. C. Bartlett, 318, Kew Road, Kew, Surrey.

R.H.S. Dinner in connection with Holland Park Hall Show.—The Royal Horticultural Society gave a dinner at the Hotel Cecil on Tuesday last to the judges, the members of its standing committees, and the chief exhibitors of the Holland Park Hall show. In the absence of the President, Field-Marshal Lord Grenfell of Kilvey presided, and he made sympathetic reference to the death of Lady Lambourne, and the consequent absence of the President. The health of the committees, judges and exhibitors was proposed by the Chairman and responded to by the Hon. Vicary Gibbs, Mr. E. J. Holland and Mr. J. Whitton. A visitor from South Africa, in response to an invitation by the Chairman for a speech, said that horticulturists had overlooked the possibilities of the South African flora in providing new garden plants, and he urged them to give less attention to plant expeditions to China and to devote some of their energies to the wild flora of Africa. Their exhibitions in South Africa were not to be compared with those held in this country, but the shows of wild flowers, collected mainly through organisations associated with schools, were fascinatingly interesting. In response to the toast of his health, proposed by Mr. W. Cuthbertson, Lord Grenfell referred to some of the difficulties of the Society during the war, and especially in connection with the desire of the military to acquire the hall, offices, and even the library.

New Allotments Bill.—The Executive Committee of the National Union of Allotment Holders has given final approval to the draft of a new Allotments Bill which is to be introduced into Parliament. The principal object of the Bill is to provide facilities for security of tenure for allotment holders. The tenancy of an allotment is sometimes taken into consideration when assessing poor law relief and old age pensions, and a strong protest was registered against this by the Executive Committee of the National Union of Allotment Holders.

Appointments for the Ensuing Week.—Sunday, October 7: Wakefield Tulip Society's meeting. Monday, October 8: United Horticultural Benefit and Provident Society's meeting; Bath Gardeners' Society's meeting. Tuesday, October 9: Jersey Gardeners' Society's meeting. Wednesday, October 10: Four Northern Counties Fruit Show and Congress (two days) in the Market Hall, Durham City; Sheffield Chrysanthemum Society's meeting; East Anglian Horticultural Society's meeting. Thursday, October 11: Wargrave and District Gardeners' Society's meeting. Friday, October 12: Foots Cray Horticultural Society's show. Saturday, October 13: Elstree and District Horticultural Society's show.

"The Gardeners' Chronicle" Seventy-five Years Ago.—*Flower Borders.* I have a border in my garden which has, this year, been filled as described below, and of which the effect is, at this moment, very brilliant, and I would be much obliged by some suggestions with a view to filling it in future years with some variety, but with equal effect. The situation of the garden is in the neighbourhood of Edinburgh, and the space to be filled in the border in question is in length 120 feet, and in breadth 12 feet. The present arrangement is as follows:—1st (*i.e.*, nearest the gravel walk in front of it), a row of scarlet Verbenas; 2nd, Nemophila insignis; 3rd, white Stocks; 4th, Erysimum Peroffskianum; 5th, Malope grandiflora; 6th, Dahlias; 7th, Hollyhocks. The Hollyhocks and Dahlias I should have no objection to continue in the same spot, but the rows in front of them might be varied in different years, provided an equally brilliant arrangement of colours, and suitable proportion as to the height of the plants, were preserved. They may either be annuals or occasionally (if thought equally suitable) plunged greenhouse plants. A list of either or both kinds, of suitable colours and height, would much oblige. *J. D., Gard. Chron., September* 30, 1848.

THE BULB GARDEN.

YELLOW CROCUSES AND PHEASANTS.

Those who are purposing planting Crocuses in quantity in the grass will do well to be aware of the fact that many birds are specially partial to yellow Crocuses and will frequently destroy the flowers. Pheasants are destructive both to the flowers and corms. It is rather singular that they leave the blue, white and striped varieties alone, while the yellow sorts may be entirely eradicated by these birds. I know of several places where Crocuses were planted in vast numbers in the grass. In these the yellows have gradually disappeared; while the blue, white, and striped sorts have increased very greatly. I have in mind a broad stretch of lawn in front of a large mansion where in spring there are myriads of Crocuses of all colours except yellow, which were planted in the same proportion at the same time. It was found that the pheasants not only destroyed the flowers but pecked the corms away. As yellow Crocuses were desired these had to be planted in an enclosed garden where the pheasants scarcely ever entered, owing to the place being so much frequented. *S. A.*

AUTUMN-FLOWERING LILIES.

Amongst autumn-flowering Lilies, L. auratum is one of the noblest, and, given a cool, moist rooting medium, one of the easiest to grow. Well-sheltered, semi-shaded spots in the woodland suit it admirably, and if the natural soil is a sandy loam or of a peaty nature, little preparation will be necessary. If the soil is of a heavy nature, however, large holes should be opened and filled with a mixture of loam, sand, peat and decayed vegetable refuse, which will render the texture porous.

Another position in which Lilies succeed is in Rhododendron or Azalea beds or in any bed where the soil is cool and peaty, and where the overgrowth is not too crowded. Planted deeply in such positions L. auratum will do well for two or three years, after which the bulbs will be likely to have increased so much that it will be a good plan to lift and divide them.

There are several good garden varieties of this fine Lily. L. a. platyphyllum is of great size and vigour, with handsome blossoms, beautifully spotted and sometimes so much as a foot across. L. a. platyphyllum virginale has a yellow band in each division with pale yellow spots, and L. a. rubro-vittatum has a red band on each petal.

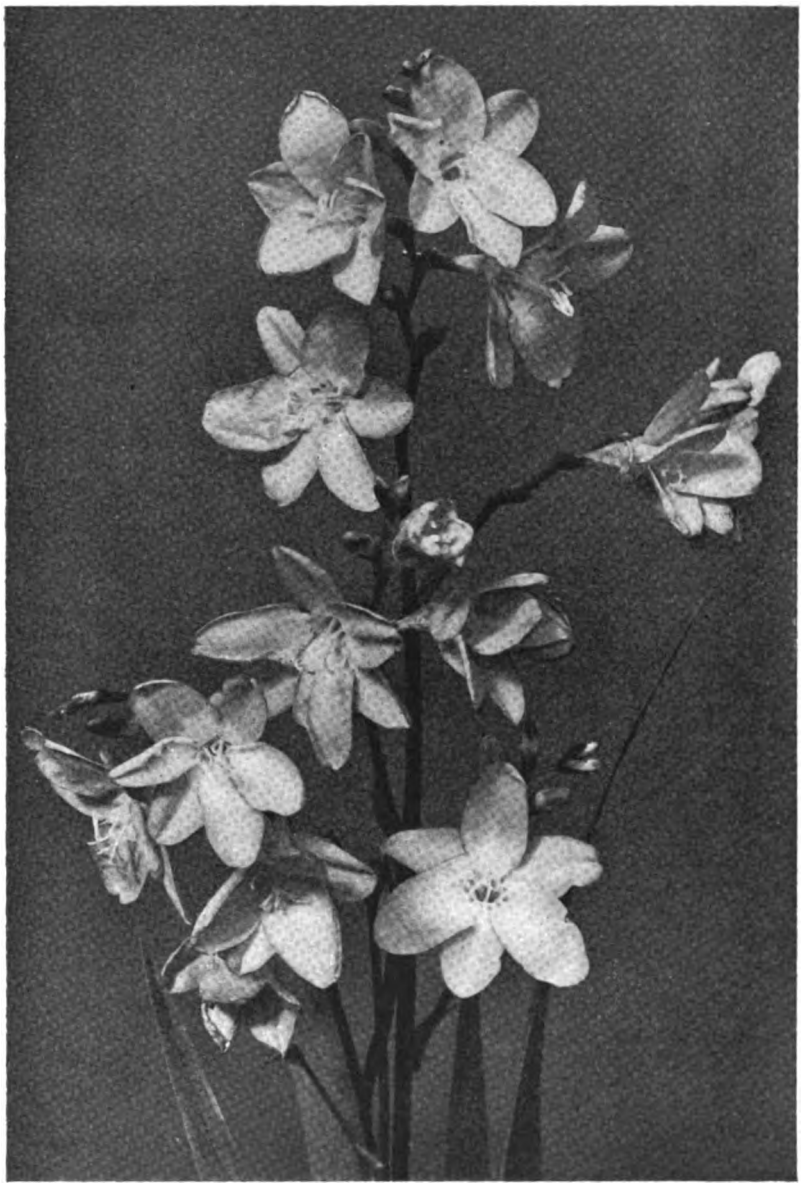

FIG. 72.—MONTBRETIA JESSIE, R.H.S. AWARD OF MERIT, SEPTEMBER 18 (SEE P. 178).

When well-grown the flower spikes of L. auratum reach a height of from 6 feet to 8 feet, and bear from five to twenty flowers on a stem, but it is most beautiful when the number of blossoms borne is not so great as to crowd the head.

When buying imported bulbs of L. auratum it is not wise to purchase too early in the season, as the first consignments sometimes contain insufficiently ripened bulbs, which arrive in a limp and flabby condition.

L. speciosum is also a beautiful, late-flowering Lily, and deservedly a favourite. Although often grown as a pot plant, it has great merit as a border subject, owing to the attractive qualities of its flowers. It succeeds under similar conditions to those advised for L. auratum, but being of a less vigorous habit, it should be given a more forward position in planting. There are many good varieties of this Lily, but probably the best for out-door planting is L. s. roseum superbum.

L. tigrinum is one of the latest flowering of our Lilies, and probably the most widely cultivated of all. Its bold, turn-cap form is well known, and its dark stems, black-spotted petals and deep brown, rust-coloured anthers combine to make it most attractive and decorative. There are several good forms of it besides the type, which is always a capital garden plant. L. t. Fortunei and L. t. F. giganteum are good varieties, but the finest of all is L. t. splendens, which is a very strong grower with large flowers of splendid colour. Tiger Lilies may be readily increased by means of the bulbils, which most of them produce in the axils of the leaves. These may be grown to flowering-bulb size in three or four years.

All the Lilies mentioned have an upper rooting system from the base of the stems, in addition to the roots that come from the bulbs, hence deep planting should be practised to insure that the upper roots, which help to nourish the growing stems, should be well under the surface of the soil. In well-prepared ground L. speciosum and L. tigrinum should be planted from 6 inches to 8 inches deep and L. auratum even as much as 10 or 12 inches. In addition, a surface mulching of rotten manure to keep the ground cool and provide nutriment is desirable for the welfare of these plants. *W. Auton, Pyrford Court Gardens, Woking.*

The Week's Work.

THE ORCHID HOUSES.

By J. T. Barker, Gardener to His Grace the Duke of Marlborough, K.G., Blenheim Palace, Woodstock, Oxon.

Seedling Orchids.—Seedling Cattleyas and Laelio-Cattleyas raised from seed sown in the spring of the present year, and pricked off into store pots as soon as they were of sufficient size to handle, should be large enough to be transferred to single pots. It is important in the cultivation of seedling Orchids that as soon as the small plants fill their pots they should be repotted at the earliest possible moment, as if allowed to overgrow each other there would be a difficulty in separating them. They should be grown close to the roof-glass, as they need all the light available in winter; an even temperature of about 65° is suitable at all times, with sufficient atmospheric humidity to create suitable growing conditions. Seedlings in small pots that have matured their first pseudo-bulbs, and are developing new roots from the base of the growths, should be repotted and given every encouragement to develop. They will not make much growth during the winter, but develop roots to an extraordinary extent, which will be the means of the plants making satisfactory growth next season. No attempt should be made to rest these small plants, but they should be grown on continually until the flowering stage is reached. They should not be allowed to suffer for the want of water, or from an excess of it, neither should they be allowed to become pot bound. It is advisable, wherever possible, to grow them in a small house by themselves, but, where this is not possible, they may be stood on a shelf in a house having a suitable temperature. The compost may consist of a mixture of Osmunda, A1 fibre, and clean Sphagnum-moss in equal parts, with half-decayed Oak leaves added. The material should be made moderately firm around the plants, which, after repotting, are best grown in a close case for a few weeks until the roots begin to enter the new material, when they will be the better for more air. The larger plants should be repotted in compost of a coarser nature, until the time they are placed in their flowering pots, when they may be grown in the same material as the full-grown plants.

Seedling Cypripediums.—The above remarks apply also to seedlings of this family, the only exception is in the material in which the plants are grown. These plants grow much better in a peat fibre and Sphagnum-moss compost composed of equal quantities of each. They should be potted rather firmly. These plants should not be exposed to quite so much light as in the case of Cattleyas and Laelio-Cattleyas. Grow the plants in a warm, moist corner, in rather a shady position of the house in which other members of this family grow satisfactorily.

Seedling Cymbidiums.—These seedlings may be treated in precisely the same manner, the only difference is they need a position near the roof glass in a house having an intermediate temperature. In their early stages these plants need a good compost, but they like something of an open nature.

HARDY FRUIT GARDEN.

By A. J. Hartless, Gardener to Major J. F. Harrison, King's Walden Bury, Hitchin, Hertfordshire.

Grease Banding.—With an increase of caterpillars in the past few years, the efficacy of this work has again been considered. The trouble is, where an estate is well timbered with Oak and other trees of which the caterpillar is equally fond, the question is what and what should not be grease-banded? Is it worth while to band fruit trees and leave others alone? The point to remember is that if the female winter moth is effectively barred from reaching the branches of a tree during the autumn, it will be by no means an easy task for young caterpillars in early spring to transport themselves from an unbanded tree unless in very close proximity. The contention that the male moth will convey the wingless female on its back to the tree and thus overcome the grease band obstacle I have so far failed to prove. With the aid of a powerful acetylene lamp I have seen the female moths climbing up the stems of standard trees and become entangled in the grease. If the grease used is liable to run, it is advisable to make a collar of the lower part of the grease band. Any injurious liquid will thus be dislodged about an inch from the bark; certain greases are very detrimental to the bark of the younger trees. To prevent them being dirt-splashed, the bands should, where possible, be at least 3 feet from the ground. Winter moths become active towards the end of September, so that the work of grease-banding should be completed by the first week of October. Growers who continually tilled the ground beneath the trees by hoeing in the early part of summer will have disturbed the hibernating pupae, and assisted birds in finding them

Planting.—Give earnest consideration to this work, and all preparations for new plantations. The selection of trees should be made known to the nurseryman. It is advisable to know the nature of the soil the trees have been growing in. Trees planted with their roots near the surface are less liable to become diseased, and the fruit will show better colour. On heavy or damp soils trees should be raised about 6 inches on mounds above the level of the ground. After planting, the trees should be securely staked. In the case of larger trees it is advisable to use three stakes in tripod fashion. The ends of these should be so placed, using cloth or sacking if necessary, to prevent rubbing during windy weather.

PLANTS UNDER GLASS.

By John Coutts, Assistant Curator, Royal Botanic Gardens, Kew.

Canna.—Plants of Canna that have done duty in the greenhouse may be stored for the winter. For this purpose the stems may be partly shortened, and the plants turned out of their pots, storing them with the balls intact. Cannas generally keep badly, or fail to start well the following season if they are kept too dry during the winter. Any frost-proof shed that is fairly moist will serve as a store; I find the plants keep best stored under a bench in a cool greenhouse, from which frost is just excluded.

Hydrangea.—Large specimen Hydrangeas may be stored for the winter in the same manner as Fuchsias; but as they will withstand much more frost than Fuchsias they may be wintered in an open-fronted, lean-to shed, protecting material being hung up in front during severe weather.

Double Wallflowers.—These flowers are very useful for greenhouse decoration. Plants that have been grown for this purpose should be lifted and placed in pots, afterwards standing them in cold frames for the winter. There are numbers of other hardy biennial or herbaceous plants suitable for growing in pots for conservatory decoration; they include such well-known plants as Canterbury Bells, Dicentra spectabilis, Anchusa italica var. Dropmore, which is a beautiful plant for early flowering in the cool or unheated greenhouse, and Polygonatum multiflorum (Solomon's Seal). There are also many beautiful varieties of Astilbe suitable for this purpose. Well-grown plants of the many fine varieties of Campanula persicifolia; especially the variety Telham Beauty, are very suitable for this purpose, and some time during this month they should be lifted and placed in suitable-sized pots; six-inch or seven-inch pots will accommodate large plants. They are best stood out-of-doors at the foot of a wall, plunging the pots to the rims in ashes to protect them from damage by frost. All the hardy subjects are best treated in this way, leaving them out-of-doors until such time as it is necessary to take them indoors, either for forcing or to be brought on slowly in a cool house.

THE FLOWER GARDEN.

By C. Turner, Gardener to Emily, Lady Ampthill, Ampthill Park, Ampthill, Bedfordshire.

Poppy Anemones.—Given open weather and the soil in workable order, varieties of Anemone coronaria may be planted from October until March. Garden soil of an average quality will suit them—the quality of the soil being less important than free drainage. As a rough guide plant the roots 2 inches deep, and 5 to 6 inches apart. Should the winter threaten to be severe, or if the garden is exposed, afford the plants a light protection of Bracken Fern or some such material during very wintry weather. These windflowers should not be allowed to become dry when carrying their flower buds in spring or they will fail of their best. Their range of colouring is wide, and the flowers last long in water when cut.

Early-flowering Gladioli.—This section of Gladioli is, perhaps, mostly grown in pots for gentle forcing in spring. The plants are, however, equally adapted for outdoor beds or borders, and the corms may be planted now until mid-December. Select ground that is not heavy in texture, and let it be well worked and made moderately rich with old manure. During hard frosts place a few evergreen branches over the border as a means of safeguarding the plants from possible harm.

Carnations.—Where it is the custom to plant Carnations in the autumn, choose a day when the soil is dry enough to allow it to be handled freely. Unless the ground be poor manure need not be added, but give it a dressing of old lime rubble. Make the plants firm when setting them in their positions. If circumstances do not favour present planting, the layers may be severed and left around the parent plants, or they may be placed in small pots and plunged in coal ashes in a cold frame, as may be most convenient, until spring.

Removal of Plants.—Plants in tubs or vases that have been occupying places in the flower garden during the season should be brought indoors, for although some are hardy enough not to be greatly harmed by slight frosts, yet their beauty may be marred. Stock plants of any kind not yet secured should be attended to before it is too late—after which the various beds, as they become unsightly, should be cleared and made ready for planting the spring bedding plants.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to J. A. Bennett, Esq., Woolverstone Park Gardens, Ipswich.

Orchard House.—If there are any Apples, Pears, and Plums still hanging on the trees the ventilation of the house will need careful attention, and if birds are troublesome every opening should be netted to keep them out. If the house is heated, a little warmth in the pipes during damp weather will be necessary to preserve Plums in good condition. An abundant supply of air should be admitted whenever the outside conditions permit. If the house is unheated, it is much more difficult to maintain a dry, buoyant atmosphere during damp weather. Under such conditions the ventilators should be kept nearly closed, and as little moisture as possible used in the house. The time is at hand for replanting or root-pruning trees that have made gross growth and failed to fruit satisfactorily. In a house in which the trees are planted out there are generally a few that require attention. Either they have not formed and matured their fruit buds, or the growth is too rank, and few, if any, fruit buds are to be found. In the first case the trees should be removed and planted out-of-doors, filling their places with others from the reserve quarter, and if there are sufficient trees well set with fruit buds to permit of the removal of the rank growers, it will be advisable to use them. Otherwise lift and roof-prune the trees, cutting back fairly closely all strong, fibreless roots. Notches should be made at intervals and kept open by means of a small stone or other imperishable material, and the tree replaced in position. A little fresh loam should be placed

Digitized by Google

about the roots. If the soil is in a moist condition it is advisable not to apply water for some days after planting, and then to give the soil a good soaking.

Cleansing the Trees.—After the leaves have fallen, prune and thoroughly cleanse the trees of any form of parasitic life or mossy growths. Paraffin emulsion is an excellent insecticide, and it is possible to use it in a much stronger form when the trees are at rest than at any other period. If badly infested with scale or American blight, scrub the affected parts with the emulsion, working it well into cracks and corners. Should the trees be reasonably free from insect pests, spraying them thoroughly will answer. Alkali wash will remove mossy growths, leaving the bark clean and bright. After the pruning and cleansing operations are carried out the mulching material should be removed. The glass and woodwork of the house should be cleansed thoroughly, and the walls lime-washed. Lightly prick up the surface of the border, and, if well filled with roots, top dress it with good loam, to which has been added a small portion of broken plaster or old mortar rubble and wood ash.

THE KITCHEN GARDEN.

By R. W. Thatcher, Gardener to Mark Firth, Esq., Carlton Park, Market Harborough, Leicestershire.

Celery.—Pay special attention to the later batches of this crop. The plants should all be earthed up some time during this month, as sharp frosts may occur at any time. Remove all side shoots carefully and any decayed foliage. Give the roots a thorough soaking with water. Celery should only be earthed up when the foliage is thoroughly dry, and the afternoon is the best time for the operation. Give the rows a good dusting with old soot, which will keep the Celery maggot in check. If labour cannot be spared to hold the stems together while earthing, it is best to tie each head with broad bast, cutting the ties when the earthing is completed. This will prevent soil getting into the hearts. Celery, which is being blanched by means of brown paper bands for present use, should be examined, and the bands loosened if they are too tight. Keep the roots well watered.

Leeks.—Leeks raised from seed sown early in the year and planted in trenches for producing large specimens should be well supplied with manure water, which may be applied easily if the plants are grown between boards as previously advised. It is a good plan to place clean straw on the surface around the plants to prevent heavy rains washing the soil into the foliage. Place a mulching of decayed manure each side of the boards. Late sown Leeks intended for spring use should, if not already done, be planted in holes made with an iron bar about 15 inches deep, dropping each plant in so that the roots rest on the bottom, and placing a little soil in the bottom of the hole to just cover the roots. Fill the holes with water, but do not use any more soil. As soon as the plants have filled the holes, draw soil up to them to assist the blanching, and as a slight protection against severe frost.

Endive.—Plants of Endive growing out-of-doors should be protected in case of frost at night, and any that were raised from seed sown in frames should be pricked into skeleton frames to prolong the supply. The watering of these plants should be done in the mornings in order that the foliage may be dry before night, otherwise they will damp off badly. Keep all dead or decaying foliage picked off, and stir the soil between the plants.

General Remarks.—As fast as all crops are harvested remove all rubbish. Any that will burn, such as Pea and Bean haulm, should be made into suitable heaps, and set on fire. The wood ash of the fire will form a useful fertiliser, and should be stored in a dry place until required for use. On wet days examine the second early Potatos in store, and remove any that are not quite sound. Storehouses should also be cleansed and limewashed.

LATHYRUS ODORATUS ZEYLANICUS.

THE SWEET PEA OF CEYLON.

I have read with much interest the suggestive letter on this subject from Mr. T. Petch, of Peradeniya, which appears in *Gard. Chron.*, September 8, p. 145, and note that he thinks it would seem much more probable that Hartog would collect the Sweet Pea at the Cape than at Ceylon.

This appears to me to be purely conjectural, for, so far as I am aware, there is no record of the discovery of the Sweet Pea in South Africa prior to 1730.

I also was not aware that Hartog had collected at the Cape and shall thank Mr. Petch if he will kindly refer me to his authority, as there may possibly be other information connected therewith that may be both interesting and useful.

The information in my possession when preparing my paper for the Sweet Pea Bi-centenary Celebration in 1900 was obtained by me from the preface to the *Flora Zeylana*, in which Linnaeus states :—" John Hartog was born and trained for the service of Flora at the gardens of Leyden. . . . William Sherard, who directed the Sceptre of Flora, was solicitous day and night regarding the procuring of the plants of Ceylon and publishing a brief account of them Hartog was the only one willing to undertake a journey into Ceylon. He embarked full of expectation and found a large number of rare plants. Entering too rashly into the woods and deserts he would have been torn in pieces by a lion had not his attendants used their guns. Having explored Ceylon he sent thence a complete Ceylon Herbarium to Cornelus Vos, Curator of the Botanic Gardens, Amsterdam. Fate and unsuitable food carried him off in the flower of his life."

Before his death Vos presented this Herbarium to John Burman, who published an account of it in his *Treasury of Ceylon Plants*.

The foregoing shows that Hartog's explorations were not confined to the coast line, and that the purpose of his journey was to secure the plants of Ceylon. The historical facts mentioned by Mr. Petch are familiar to every student of the records of colonisation; and thirty years of business and other association with horticulturists in Ceylon have kept me fairly well informed of the climatic and other difficulties with which the early settlers, Dutch and British, had to deal. Some of the information obtained by me from Mr. Wm. Nock, Superintendent of the Hakgala Botanic Gardens, Nuwara Eliya, was published by me in an article entitled "Historical Facts and Fancies" in the *Sweet Pea Annual* for 1905.

I still think that the suggestion of Dr. Hallier and the inference drawn by me therefrom form a fairly satisfactory basis for the settlement of that much-disputed point, the origin of the Sweet Pea of Ceylon. *S. B. Dicks*

SWEET PEA THE PRESIDENT HARDING.

The new Sweet Pea, The President Harding (see Fig. 73), which has just been placed on the market by Messrs. Atlee Burpee and Co., Philadelphia, is remarkable for its large size and perfect form. The colour may best be described as Peach-red, a beautiful warm, pure flame colour. It was shown last year before the National Sweet Pea Society, in company with one hundred and five other new seedlings, and gained the only Certificate of Merit awarded on that occasion, a unique distinction for an American-raised Sweet Pea. A high honour has been won by this remarkable Sweet Pea in America, for it has been awarded the Silver Medal of the American Sweet Pea Society, an honour we are informed that no other Sweet Pea has received at that Society's hands. It is said by its raisers to be sun-proof, and if it will stand the fierce summer sun in the land of its birth, it is fairly certain to withstand the milder rays over here; however, those who try it will be able to settle this for themselves.

It will be interesting to see how this new variety behaves in this country under ordinary cultivation, and there will be many, doubtless, who will desire to possess it for exhibiting.

GARDEN NOTES FROM S.W. SCOTLAND.

Autumnal Asters are troublesome things in respect that they require to be tied up if the better way of setting small branches among them as they grow has been neglected. This is especially the case in a wet and blustery autumn such as we are passing through (we registered 7½ in. of rain in August and had some heavy gales). It may be noted, therefore, that one species—Aster pyrenaeus—needs no support, but carries its large flowers—lilac blue, faintly tinged with pink—in a flattened panicle, through any amount of buffeting, at a height of two feet. Moreover, it has a longer flowering season than most of the family; it began here this year on 17th August, and is still in beauty on this 24th September. Whether it be from prejudice, prepossession, or pedantry, I must confess to entertaining a strong preference for good natural species over plants that owe their distinction to the florist.

Very different in habit from the Pyrenaean plant is an Aster that came here from a friend under the name of A. Lipskii, for which I can find no warrant in the *Kew Hand List* or elsewhere. Rising from a cluster of lanceolate, radical leaves, the stiff stems, bearing three or four linear leaves, carry in July, at a height of twenty inches, the handsome solitary flowers, each measuring three inches across; the ray florets are of a rich, vinous purple, set round a large orange disc. The origin of this fine Aster seems to be unknown.

Notwithstanding my preference for natural species, it was an agreeable surprise to come lately on a very beautiful variety of Trollius in Messrs. Cunninghame and Fraser's nursery, Edinburgh, an ancient establishment which I never visit without finding something worth carrying away. The label beside this Globe Flower bore the inscription "Trollius Y. Smith." It has very large flowers of clear lemon-yellow, at least twice the size of those of our native T. europaeus, and it seems to possess the desirable property of flowering in autumn. Whether it does so in spring also remains to be seen.

On account of some minute structural difference which I am not doctor enough to describe, the white-flowering Rue has forfeited the family name of Ruta and been endowed with the cumbrous title of Boenninghausenia albiflora. It is a Japanese plant, which deserves to be more often grown than it is, for it makes a little dome of bipinnate leaves three feet high, in colour and texture somewhat like those of an Adiantum, and September has not run its course before the foliage is veiled in a mist of small white flowers.

The pretty Peruvian annual, Calceolaria chelidonioides, offers an exception to the general rule that plants from the Southern Hemisphere do not readily establish themselves in the Northern Hemisphere, for it springs up in the borders here every autumn, and is welcome for its pretty yellow flowers and erect habit. I do not know how it arrived here, probably in the roots of some other plant; but it has never deserted us during the last thirty years. The shrubby species, C. rugosa (integrifolia), from Chile, makes a fine display in the open border, for it remains covered with golden bloom from the beginning of July till the end of September. It is hardier than it gets credit for; there is a bush of it here three feet high and five feet through that has withstood 17 degrees of frost without the slightest protection. In inland districts it requires the defence of a wall.

Kirengeshoma palmata is a disappointing plant, the flowers might easily be so much better. Still, it is worth a place in the garden, were it only for the sake of its shapely leaves.

It is an annual treat to look forward to when Nerine Bowdenii opens its bright rose, delicately crimped flowers. It is quite as hardy as Amaryllis Belladonna, and flowers here simultaneously with that charming plant in September, fully a month later than in Sussex. As a cut flower Nerine stands fresh for many days.

Few, if any, genera of plants assume so many disguises a the Knot Weeds—Polygonum. One of the quaintest is P. equisetiforme, whereof, as the name denotes, the clump of two-foot stems bear as close resemblance to some Equisetum as do the sprays of the Australian Beef Tree—Casuarina equisetifolia. In September these stems become studded along nearly their whole length with little, white, starlike flowers. P. campanulatum is a notable acquisition, producing its panicles of fragrant blossom over a long period. Moreover, it is not such a rampant terror as P. polystachyum. It certainly spreads pretty freely, but does so above-board, enabling one to keep it in check; whereas it is impossible to control the subterranean incursions of the other.

There is often an autumnal flush of flower on some of the small-leaved Chinese Rhododendrons, especially on R. hippophaeoides, R. intricatum, and the like; but none of them here is so regular—or is it irregular?—in that respect as the fiery scarlet R. haematodes. I counted twelve trusses on a bush not two feet high last week, the same bush having flowered freely last April, and is already well furnished with flower-buds for next spring. Mr. Millais does scant justice to this choice Rhododendron. He states that the corolla is more than an inch long. I put a tape to one this morning and found it to be exactly two inches long and the same across the bell-shaped mouth. *Herbert Maxwell, Monreith.*

NOTES FROM WISLEY.

It was a pleasant surprise, after the frequent and heavy rains, to see such a wonderful display of Dahlias at Wisley. The brilliant flowers sparkled in the hot sunshine and almost dazzled one, owing to the large proportion of vivid red and scarlet varieties. In the Star section, Seafield, with large rosy-apricot flowers, was particularly attractive. In the Cactus group, a fine white variety, Jkr. G. van Tets, was prominent by reason of the assertive manner in which it displayed its blooms, not hiding them in the foliage after the fashion of many varieties in this class. Two small Paeony-flowered varieties, remarkably full of bloom and suitable for garden decoration, are Rosie, pink, and Trixie, scarlet.

Owing to the fact that several severe ground frosts have been experienced at the gardens, it has been thought advisable to give protection at night by means of light sacking to the early-flowering Chrysanthemums which are undergoing trial. Some handsome blooms are already showing, and the plants are in a beautifully healthy condition.

Of the perennial Asters, those of the Amellus section are at present the most conspicuous, notably Mrs. Perry, Cassubicus, and King George, the last being particularly good this year.

In the herbaceous borders, yellow Helianthus, Heleniums, and Rudbeckias predominate, the taller varieties forming something like a hedge at the back of the border. A solid mass of colour is provided by the flowers of Helianthus multiflorus, and a good double variety named Loddon Gold. Of the smaller plants, Rudbeckia speciosa attracts attention in the front row with its nigger-brown button-like centre and deep yellow rays.

In the wild garden there are numbers of Colchicum autumnale together with some fine forms of the larger C. speciosum. Colchicum agrippinum, prettily chequered in the manner of our common Fritillary, is to be seen flowering in the rock garden, where are also large patches of Crocus nudiflorus.

Numbers of British fungi are to be observed about the gardens and in the woods. Of the edible kinds, in addition to the common Mushroom, is an allied species Agaricus procerus, known as the Parasol Mushroom, which makes a most appetising dish. The Giant Puffball (Lycoperdon giganteum) is also palatable in its earlier stage. Of the poisonous kinds the Death Cap (Amanita phalloides), which is occasionally mistaken for the Mushroom, with fatal results, is frequently seen, as is Boletus luridus, the behaviour of which is interesting in that, in breaking off a portion of the cap, the exposed surface quickly turns from a dull yellow to blue.

The ground around the laboratory is nearly in order, and the shrubs planted under the walls are beginning to establish themselves. Among these, Tricuspidaria dependens and Eucalyptus viminalis have lately made rapid growth, which, however, is more than likely to be spoiled by frost; Escallonia pulverulenta is showing its pale pink flowers.

My thanks are due to Sir Herbert Maxwell and to *C. F. C.* for pointing out an obvious mistake in my notes on p. 146. Cotoneaster frigida should be C. affinis, the fruits of which I described as turning black. Perhaps a dark purplish-brown would be a more accurate description. Mr. W. J. Bean, in *Trees and Shrubs Hardy in the British Isles*, writes: "The identity of this species is somewhat confused, but what is usually grown under the name is an ally of C. bacillaris and C. frigida." *J. G. White*

NOTES FROM A WELSH GARDEN.

One of the most interesting plants in flower in the woodland during September was Kirengeshoma palmata. This somewhat uncommon Japanese introduction is a fine subject for partial shade and grows well in cool, but well-drained vegetable soil. It makes a large clump, the branching stems, rising to about 3 feet, being glossy black and bearing broad, palmate leaves of a fresh green hue. Towards autumn the extremities of the growths break into loose sprays of pendulous blossom, the individual flowers being tubular, some 3 inches long, leathery in texture and of a soft ivory yellow. There is a peculiar, unconventional elegance about K. palmata which is distinctly fascinating, and the noble foliage, which is entirely herbaceous, turns a good bold yellow in late autumn.

Several of the Cistuses have produced a crop of late bloom since the rains, the most florriferous being C. salvaefolius and C. florentinus. C. corbariensis is also fairly reliable as an autumn bloomer, and C. crispus, with its beautiful variety Sunset, can always be depended on for some bright colour at this season. C. (Helianthemum) formosus unicolor, a lovely shrub, is always the best of the taller yellows as a late bloomer, and for several weeks its grey green foliage has been ablaze with its charming blossoms. Indeed, a little group consisting of this plant and Potentillas Farreri and Vilmoriniana, has been one of the brightest objects in the garden through several weeks of rough and changeable weather.

The Fuchsias are always conspicuous in September and, quite apart from their rich colouring, they are worthy of much admiration for the brave manner with which they endure the most boisterous winds and rain. The old F. Riccartonii is a handsome shrub whose bold, sealing-wax red is very welcome at a time when other flowers are few and the autumn tints begin to invade the woodland green. Of much lower stature and more elegant habit is F. gracilis, which appears in several pretty forms, and another reliable kind here is F. exoniensis (corallina). Though it needs protection even with us F. recurvifolia is a little species of the greatest charm for a rock garden ledge, and another dwarf which is tolerably hardy is F. Cunninghamii. The trailing species, F. procumbens, has proved quite hardy here, and an old plant is now well furnished with its curious amber, chocolate and green tubular flowers which are followed by large, Plum-red fruits.

Although Escallonia macrantha is practically an all-season bloomer, its flowers are never so fine as they are in these late days, and the sweetly-aromatic fragrance of the foliage, like that of the Balsam Poplar, is as noticeable on a warm day as it is in June. The latest of all the Escallonias, E. floribunda, has opened its trusses of large, pure white flowers, which are not seen in perfection every season, since, being so late, they are very liable to be spoiled by rain and wind. Abelia floribunda is also frequently a late bloomer, but the clusters

Digitized by Google

pretty pinky-white flowers which adorn its elegantly curved branches are so disposed along the latter that they do not seem to suffer in the least, no matter how rough the weather may be.

Among the berry-bearing Cotoneasters, C. bullata was the earliest to ripen its fruits, and very attractive the latter are hanging in conspicuous bunches from the broad, fan-shaped branches. C. Dielsiana (applanata), though the fruit is considerably smaller, is another which colours very early, and there is something very attractive about the elegant habit of this species. If the birds will allow, there will be a good crop of berry on C. frigida, a concession they rarely grant in the case of C. horizontalis. This fine species is, however, better than usual this season, but, admirable as it is, I always think the flat-growing variety of this Cotoneaster is even better, the berries being larger, greater in quantity and of a more pleasing colour. At any rate in the form grown here the fruit of the latter has a more decided infusion of orange in the crimson than has that of the type. C. Zabelii, which is now bearing coloured berries for the first time in this garden, promises to be a highly attractive member of this interesting family. The most ornamental of the evergreen Cotoneasters now carrying fruit is undoubtedly C. rugosa var. Henryi, a shrub of singular elegance and beauty, and one that appears to bear but little resemblance to any of the others with the single exception of C. salicifolia.

That splendid shrub, Daboecia polifolia alba, though it has never been out of flower since May, has now put forth fresh spikes of blossom with that prodigality which is such a notable feature of its genus. The purple form, if not quite so charming, is also a fine and free autumn bloomer not to be omitted from any collection of Heaths, and then there is Bryanthus empetriformis, which can always be relied upon to produce some clusters of its lovely ruby and pink blossoms towards the "back-end." Polygonum vaccinifolium will afford bright mounds of colour throughout autumn in the woodland as well as the rock garden, both blossom and foliage contributing to the claim that this little creeping shrub is still one of the very best of its attractive race. *A. T. Johnson.*

ORCHID NOTES AND GLEANINGS.

LAELIO-CATTLEYA SARGON, WESTONBIRT VARIETY.

A remarkable inflorescence of five large and beautifully formed flowers of this showy variety of Laelio-Cattleya, which is of the same class as the Westonbirt L.-C. Morvyth, is sent by Mr. H. G. Alexander, Orchid grower to Lt.-Col. Sir George L. Holford, K.C.V.O., Westonbirt, Tetbury. The spike is a sufficient flower display for a vase in itself, and is best so displayed. The sepals and petals are white, with a slight mauve shade, whilst the broadly-expanded lip is ruby-crimson, changing to violet in front and having distinct gold lines from the base to the centre. The fine L.-C. Lustre (C. Luddemanniana × L.-C. callistoglossa) first flowered at Westonbirt in 1907, L.-C. Sargon (C. Hardyana × L.-C. Lustre) and L.-C. Orpheus (C. Schilleriana × L.-C. Lustre) in 1915, while L.-C. Morvyth, a later Westonbirt product was a L.-C. Lustre cross. Others have made crosses with L.-C Lustre, and it always gives good and distinct features in the progeny.

FLOWERS FROM ROSSLYN.

Flowers of a selection of the many rare and curious Orchids at present blooming in his collection are sent by H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. F. W. Thurgood), the specimens well demonstrating the wide range of species cultivated, some of the small and reputedly delicate species having been in the collection for many years. The Masdevallias include a very dark form of M. Chimaera of the Roezlii section; M. Chestertonii, a pretty greenish-yellow species spotted with purple, the showy feature being the large concave orange-red lip; M. Carderi, a singular species with cupped white labellum (the plant is a division of the original of 1883 collected by Carder near Frontino, New Granada); and M. tridactylites, with beetle-like flower showing the affinity of this section of Masdevallia to Restrepia, comparison with which is provided by the flowers of Restrepia antennifera sent. Two extremes in Cycnoches are represented by the Swan Orchid, C. chlorochilon, the one sent being the larger female form, with well-defined ovary, the male bloom, which may be produced on the same plant, being smaller, and with the pollinia well developed. The flower received has the fleshy labellum, ventricose in front, and the raceme form of C. Egertonianum viride with many stellate greenish male flowers.

Aerides Lawrenceae (F.C.C. 1884) is of the original importation. It is the largest and best of the Aerides ordoratum section, and the plant is said to have two spikes of twenty-three and twenty-four flowers respectively.

Chondrorhyncha Chestertonii, a cream-white and yellow flower with much fringed lip, is one of the leafy Crytopodieae of the Warscewiczella class. It has a bad reputation for being difficult to grow, yet Mr. Pitt in his London garden finds it a good subject, and his plants are seldom without blooms.

Other flowers sent are the white Calanthe veratrifolia; Dendrobium sanguinolentum with violet-tipped flowers; Miltonia vexillaria rubella, which, though a small form, flowers after the other varieties are over; Oncidium Papilo majus, a grand flower of the Trinidad type; and other Oncidiums, Promenaea xanthina, Odontoglossum aspidorhinum, and Epidendrum variegatum.

LEPTOTES BICOLOR.

This pretty, terete-leaved species succeeds suspended in the Cattleya house, and is best grown in shallow pans, in similar compost to that used for Cattleyas. During active growth the plants should be given liberal supplies of water, but when growth is completed the amount of moisture should be reduced. *B.*

HARDY FLOWER BORDER.

SIDALCEA LISTERI.

Those desirous of possessing the best of the taller border plants, suitable either for the decoration of the garden or for use as cut blooms, should not overlook Sidalcea Listeri. I believe that it was found in a garden in Lanarkshire and introduced by Mr. Lister, of Rothesay. I saw it the first year it was shown by Mr. Lister at a Scottish show and admired it greatly. It soon acquired great favour because of its beauty, so superior is it to the ordinary pink Sidalceas. It has larger and rounder flowers of a better colour. Its importance in the garden is increased by the ease with which it is cultivated. It will grow well in any ordinary garden soil, light or heavy, but it is deserving of a little special treatment such as giving it a sound loam, well enriched with animal manure. Then it will grow taller and bear finer blooms. Its stature varies considerably, but it is generally from three to four feet tall. It increases readily at the roots and may be propagated by division in spring or autumn. S. Listeri is perfectly hardy. *S. Arnott.*

FIG. 74.—CLEMATOPSIS STUHLMANNII IN ITS NATURAL HABITAT (SEE P. 205).

KIRENGESHOMA PALMATA.

For a particularly shaded border or the woodland garden K. palmata is a handsome and interesting plant. It is a hardy, herbaceous perennial from high altitudes of Japan, the polished, ebony stems rising to about 3 ft. and bearing broad, palmate leaves like those of a Sycamore. The flower sprays appear at the ends of these growths in August and carry a number of ivory-yellow blossoms, the petals of which are some 2 inches in length and overlapping. K. palmata will thrive in good, free loam intermixed with peat and leaf-mould, provided the soil does not get excessively dry in summer. When the blossoming is over the foliage assumes fine yellow and orange tints. *A. T. J.*

THE DEVELOPMENT OF THE DAHLIA.*

AN autumn flower show in our days is nearly everywhere characterised by the Dahlia; at least, this is so in Holland, where the flower has again become a topic of public interest. The important place which the Dahlia occupies, not only at shows, but in the floriculture of the various countries, has led me to read a paper on this subject.

The highly appreciated presence of so many distinguished representatives of foreign horticulture is an appropriate opportunity to refer to the part which Holland has repeatedly played in the development of the Dahlia as an ornamental plant. I consider it a great advantage to be able to illustrate this paper by a collection of publications and plates, including many which, as a rule, are not found worthy of being preserved. Indeed, the historical truth may often be discovered exclusively in trade catalogues, especially so far as new introductions and new seedlings are concerned, which have been of some importance to the development of a plant genus, while such dates and facts can scarcely be found with the same accuracy anywhere else. The necessity of systematically preserving trade catalogues of horticultural products in public libraries is becoming recognised more and more. The United States took the lead in this direction many years ago, and at this moment the library of the State Agricultural University at Wageningen is in the possession of a nucleus of such a collection, and it will be a great pleasure to me to add the Dahlia catalogues here shown to the Wageningen collection after this conference.

INTRODUCTION OF THE DAHLIA IN EUROPE.

The Dahlia has so often been treated in booklets and magazine articles in various languages that the history of the introduction from its native country Mexico, is generally known. It may be remarked here that, as a rule, most authors accept as an axiom that the Dahlia has been imported from its country as a wild plant only. This seems not very likely. The endless variability which the Dahlia proved to possess at once after its introduction in Europe seems an indication that it had long been cultivated in Mexico before its arrival in Europe.

The oldest reference to the Dahlia seems to have been made so long ago as 1615, when Francisco Hernandez, physician to the Spanish king Philip II., published his work on *The Plants and Animals of Mexico*. As I have not seen this book, I cannot give any particular information on the figures of the Dahlias to which some Dahlia monographs refer. But I am pleased to be able to show the second and enlarged edition of the same book, most kindly lent for this occasion by the Director of the Teyler Institute at Haarlem. In this book, published in 1651, two, or perhaps three, figures of plants are given under the Mexican name of Acocotli, which evidently represent Dahlias, and two of them most probably D. coccinea and D. variabilis.

The facts of the introduction in Europe are well known, and seem to be well fixed. Practically, there were no Dahlias cultivated for commercial purposes until 1805 or 1806, for although the flowers had been introduced from Madrid to England in 1798 (not 1789), and to France by the Count de Selieur, the Germans were the first to grow the Dahlia successfully from seeds sent from Mexico by Alexander von Humboldt, who, with Bonpland, visited that country in 1803.

THE FIRST DOUBLE VARIETIES.

Von Humboldt sent these seeds to Mr. Otto, Director of the Berlin Botanic Garden, and from there the Leipsic court gardener, Breiter, evidently obtained the nucleus of his Dahlia collection, so that as early as 1806 he could offer 55 varieties, single and half-double. A perfectly double form is first mentioned in 1808, and said to be obtained from seed by Hartweg, of Karlsruhe.

In Belgium, the Director of the Botanic Garden at Liége, Mr. Donckelaar, commenced Dahlia cultivation in 1808. The third generation of his seedlings showed not only many colours and changes in the form of the foliage, but, besides the half-double flowers he had already obtained before, two absolutely double-flowering varieties, one of which was of a bluish colour. Next year he distributed these Dahlias to Paris, Ghent and London. Donkelaar discarded all the varieties that were not full double, and soon had a collection in which over sixty distinct colours were represented. In 1820 he had already raised 10,000 plants. He later raised his seedlings exclusively from dwarf varieties, and he stated that in every new generation the number of dwarf varieties increased, and in the same proportion the flowering period became earlier.

The Napoleonic wars were a great obstacle against the spreading of the Dahlia in other countries, and some years elapsed before the commercial cultivation of Dahlias commenced either in Belgium, England or France. Meanwhile, the Dahlia made its appearance in Holland, and this cannot be a surprise, considering the fact that some Dutch bulb growers, notwithstanding the disturbed state of Europe, regularly visited the yearly markets at Leipsic and Frankfort, and thus had many opportunities of obtaining seeds of the Dahlias already known in Germany.

A very exact account of the first double Dahlias raised in Holland has been given by Dr. Molkenboer in an old gardening monthly, the *Maandschrift voor Tuinbouw*, of 1852. According to his statement, a florist of Leyden, C. Arentz, raised a double violet Dahlia from seed in 1813, and offered seventy-two seedlings of various shades in 1819. The method of growing Dahlias from cuttings was discovered and successfully practised. The Dahlias raised in Holland were sent to France, England and Germany, and were evidently used there for further improvements. French horticultural authors, such as Count Lelieur, in his *Mémoire sur le Dahlia*, published in 1829, state that Soutif, a nurseryman at Passy, bought double Dahlia seedlings from the Dutch raisers and put them on the market; he also raised the best French seedlings shortly afterwards.

In the *Floricultural Cabinet* of March 1841, the Editor, Joseph Harrison, states: "The extension of sorts, however, in this country (England) progressed tardily until the peace of 1814, when numerous sorts were imported from France, Germany, and Holland, where the propagation of new varieties had been more successfully pursued, especially by Count Lelieur at Paris, M. Otto at Berlin, and M. van Eeden at Haarlem. The introduction of these kinds stimulated several intelligent cultivators to more constant attention in the multiplication of varieties."

This remark most probably refers in particular to the first double pure white Dahlia which was raised by Arentz, of Leyde, in 1821. From two ground roots he obtained 36 young plants. The Haarlem firm, A. C. van Eeden and Co., bought half the stock, and the Dahlia was afterwards distributed under the name Waverley, and kept its place as the best double white Dahlia for many years.

In Germany the Dutch Dahlias were introduced by the bulb grower, R. C. Affourtit, of Lisse, who made an arrangement with one of his customers at Leipsic, enabling him to show Dahlia flowers at the yearly markets there, so as to advertise his tubers. These flowers caused such a sensation that Mr. Affourtit had to secure the protection of the police against the crowd of admirers who wanted to convince themselves that the objects shown were real flowers. This story seems to prove that the Dutch Dahlias of those days were far in advance of the German seedlings.

THE DEVELOPMENT OF THE SHOW DAHLIA.

Very early we find a special reference made in England to dwarf forms. "For these desirable kinds of Dahlias," writes William Smith in the *Transactions of the Horticultural Society*, of 1828, "we are principally indebted to William Wells, Esq. His gardener, Mr. Joseph Wells, possessing due knowledge of the qualities he wished his productions to possess, has succeeded in raising sorts which combine dwarfishness with early and abundant flowering, and produce blossoms of the most beautiful descriptions. They begin flowering in June when not above a foot high, and continue to blossom in constant succession, till the autumn frosts divest them of their beauty, they seldom exceed three feet in height, and some are even more dwarf."

As we have seen before, dwarf forms had been raised already many years ago by Donckelaar, in Belgium, and as his Dahlias were imported in England, it seems very probable that Wells improved the Belgian productions. However this may be, the early English dwarf Dahlias soon spread over the continent of Europe. Enthusiastic articles were devoted to them in the *Revue Horticole* of 1832, and Von Reider's *Annalen der Blumengärtnerei*, of 1833, and many nurseries and private gardens are mentioned, where they were grown.

Besides Wells, other noted growers were Dennis, Girling, Glenny, Harris, Levick, Salter, Whale, Wheeler, Young, and later Keynes, Turner, and many others.

(To be continued.)

* A paper read by Mr. Ernst H. Krelage before the International Horticultural Congress at Amsterdam, on September 18.

HOT WATER.

IT is exactly fifty years since I brought the value of hot water as an insecticide and cleansing agent into notice. Doubtless it had been employed previously, but as the only effective way of securing attention is to keep a subject before the public, I may be allowed to restate and amplify what was noted then.

It was my first charge, and a houseful of Camellias had become so filthy and so colonised by scale as to require continual sponging, without doing much good. So boiling water was obtained, strengthened with soft soap, and forcibly applied to the shrubs by means of a syringe, then the leaves were rubbed clean with a sponge; this treatment was repeated three times in the same summer, with the satisfactory result that the Camellias were left perfectly clean and free from insects. Camellias and some other plants are able to endure the application of very hot water. But in the case of some other plants, vines, for instance, it is not safe to use it warmer than 135° to 150°. At the present time vines infested more or less by any living pest should be freely washed, either with clear hot water at these temperatures or with

Digitized by Google

added soap. Peaches, so frequently subject to insect infestation, may also, after useless shoots have been removed, be treated similarly, and if there should exist any fear of injury, then a little afterwards cold water should be syringed over the trees.

Out-of-door trees, Plums, Pears and Peaches, with scale on them, may be treated similarly, though it may be necessary to repeat the application later in the year. The worst of all insects is no doubt American Blight, so difficult to kill owing to its impenetrable outer, protective covering. Instead of hot water I have successfully used hot petroleum—a rather dangerous oil to heat by ordinary means, but quite safe if poured into a pail or other receptacle containing boiling water, stirring the liquids for a few minutes, after which the oil rises to the top and, taken up by a syringe, may be applied forcibly to the parts affected by the insects. I have never noticed any harm to Apple trees after this drastic treatment, the stems and bare branches only being syringed; the woolly covering of the insect afforded no protection against the hot oil.

I have known the question discussed whether it were better to water plants with cold water or slightly heated. The value of heated water over cold is that it requires a smaller quantity to moisten soil, otherwise I do not think there is much, if any, difference. But in the case of pot plants or borders that have been allowed to become over-dry, then quite warm water should be applied. In the case of house plants, I have made it an invariable rule to water these with heated water, firstly because of the smaller quantity required, and secondly because there are always plants that, standing in overheated positions, are apt to become over-dry in the intervals between attention. For this purpose water from the hot water tap is invaluable, and for peat-potted plants is probably indispensable. Has any reader ever tried hot water for a wasp nest established on a plant in the greenhouse, or in some other equally difficult position? A slight addition of Gishurst renders the application a certain as well as a speedy remedy. I need not mention how much more rapidly pots, stages, etc., are cleansed when hot water is used rather than cold, and, of course, soft water should be used in every instance. *R. P. Brotherston.*

PLANTS NEW OR NOTEWORTHY.

NOTES ON EAST AFRICAN PLANTS.

A glance at a contour map of Africa shows the greater part of the "great dark continent" as a huge plateau, with an average elevation of about 2,200 feet. The coastal plain, below 600 feet, is in some parts very narrow, beyond which the land rises steeply to the plateau, whence the rivers descend by a series of rapids. The Eastern Plateau averages from 3,000-5,000 feet, the highest lands being of igneous origin, like Mt. Ruwensori (18,000 feet), Mt. Elgon (14,000 feet), Mt. Kenya (17,500 feet), and Mt. Kilimanjaro (19,200 feet), near the Eastern Rift Valley. These volcanic peaks capping the plateau are clothed with a vegetation as interesting as it is varied, and they may be likened to oceanic islands in that the floras of their upper slopes are almost as much isolated. The accompanying illustrations, from photographs by Mr. T. Alexander Barns, the explorer, give some idea of the wonderful wealth of plant life found in these regions, where one meets with weird and extensive forests of Senecio and Lobelia of tree-like habit, quite unlike the species of these genera to which we are accustomed in this country. In Fig 74 is shown a sample of the herbaceous vegetation which clothes the savanna or park-like formations, in this case the plant being Clematopsis Stuhlmannii, a species of a new genus described by me a few years ago in the *Kew Bulletin* (1920, p. 20). From a phylogenetic point of view Clematopsis is of extraordinary interest, for it forms a link between the genera Anemone and Clematis which had not before been recognised, thus showing a close connection between the tribes Anemoneae and Clematideae of the family Ranunculaceae, and incidentally pointing to the true origin of Clematis out of Anemone. Even the veriest tyro in botany knows that the coloured sepals in Anemone are overlapping (imbricate) in the bud stage, whilst in Clematis they merely touch at the edges (valvate). In Clematopsis they are either wholly overlapping or some are overlapping and the remainder touching at the edges in the same flower. On this account I have established the genus Clematopsis. Another of its interesting features is that whilst most of the species have opposite leaves, like Clematis, those of Clematopsis Stanleyi (Clematis Stanleyi) occasionally revert to the alternate form under cultivation.

FIG. 75.—GIANT EUPHORBIAS (E. ABYSSINICA?) ON THE NGORONGORO CRATER, WITH LAKE MAGAD IN THE BACKGROUND.

According to Welwitsch, species of Clematopsis form almost a dominant feature of the vegetation in the elevated regions of Angola, where large tracts of pasture ground amidst the forests look at a distance in the flowering season as if covered with snow. Mr. Barns' photograph shows a somewhat less vivid picture in the highlands of East Africa.

A scene more typical of Abyssinia is seen in Fig. 75—that of the great Ngorongoro Crater and its lake, called Magad by the Masai people. In the far distance may be seen the opposite side of the crater ring, and in the foreground some exceptionally large examples of tree Euphorbia, probably Euphorbia abyssinica. Many of these trees must be of considerable antiquity, and at one time no doubt dominated the landscape even more than at the present day. *John Hutchinson, Kew.*

(To be concluded.)

Introduction of the Dahlia in Europe.

The Dahlia has so often been treated in booklets and magazine articles in various languages that the history of the introduction from its native country Mexico, is generally known. It may be remarked here that, as a rule, most authors accept as an axiom that the Dahlia has been imported from its country as a wild plant only. This seems not very likely. The endless variability which the Dahlia proved to possess at once after its introduction in Europe seems an indication that it had long been cultivated in Mexico before its arrival in Europe.

The oldest reference to the Dahlia seems to have been made so long ago as 1615, when Francisco Hernandez, physician to the Spanish king Philip II., published his work on *The Plants and Animals of Mexico.* As I have not seen this book, I cannot give any particular information on the figures of the Dahlias to which some Dahlia monographs refer. But I am pleased to be able to show the second and enlarged edition of the same book, most kindly lent for this occasion by the Director of the Teyler Institute at Haarlem. In this book, published in 1651, two, or perhaps three, figures of plants are given under the Mexican name of Acocotli, which evidently represent Dahlias, and two of them most probably D. coccinea and D. variabilis.

The facts of the introduction in Europe are well known, and seem to be well fixed. Practically, there were no Dahlias cultivated for commercial purposes until 1805 or 1806, for although the flowers had been introduced from Madrid to England in 1798 (not 1789), and to France by the Count de Selieur, the Germans were the first to grow the Dahlia successfully from seeds sent from Mexico by Alexander von Humboldt, who, with Bonpland, visited that country in 1803.

The First Double Varieties.

Von Humboldt sent these seeds to Mr. Otto, Director of the Berlin Botanic Garden, and from there the Leipsic court gardener, Breiter, evidently obtained the nucleus of his Dahlia collection, so that as early as 1806 he could offer 55 varieties, single and half-double. A perfectly double form is first mentioned in 1808, and said to be obtained from seed by Hartweg, of Karlsruhe.

In Belgium, the Director of the Botanic Garden at Liége, Mr. Donckelaar, commenced Dahlia cultivation in 1808. The third generation of his seedlings showed not only many colours and changes in the form of the foliage, but, besides the half-double flowers he had already obtained before, two absolutely double-flowering varieties, one of which was of a bluish colour. Next year he distributed these Dahlias to Paris, Ghent and London. Donkelaar discarded all the varieties that were not full double, and soon had a collection in which over sixty distinct colours were represented. In 1820 he had already raised 10,000 plants. He later raised his seedlings exclusively from dwarf varieties, and he stated that in every new generation the number of dwarf varieties increased, and in the same proportion the flowering period became earlier.

The Napoleonic wars were a great obstacle against the spreading of the Dahlia in other countries, and some years elapsed before the commercial cultivation of Dahlias commenced either in Belgium, England or France. Meanwhile, the Dahlia made its appearance in Holland, and this cannot be a surprise, considering the fact that some Dutch bulb growers, notwithstanding the disturbed state of Europe, regularly visited the yearly markets at Leipsic and Frankfort, and thus had many opportunities of obtaining seeds of the Dahlias already known in Germany.

A very exact account of the first double Dahlias raised in Holland has been given by Dr. Molkenboer in an old gardening monthly, the *Maandschrift voor Tuinbouw*, of 1852. According to his statement, a florist of Leyden, C. Arentz, raised a double violet Dahlia from seed in 1813, and offered seventy-two seedlings of various shades in 1819. The method of growing Dahlias from cuttings was discovered and successfully practised. The Dahlias raised in Holland were sent to France, England and Germany, and were evidently used there for further improvements. French horticultural authors, such as Count Lelieur, in his *Mémoire sur le Dahlia*, published in 1829, state that Soutif, a nurseryman at Passy, bought double Dahlia seedlings from the Dutch raisers and put them on the market; he also raised the best French seedlings shortly afterwards.

In the *Floricultural Cabinet* of March 1841, the Editor, Joseph Harrison, states: "The extension of sorts, however, in this country (England) progressed tardily until the peace of 1814, when numerous sorts were imported from France, Germany, and Holland, where the propagation of new varieties had been more successfully pursued, especially by Count Lelieur at Paris, M. Otto at Berlin, and M. van Eeden at Haarlem. The introduction of these kinds stimulated several intelligent cultivators to more constant attention in the multiplication of varieties"

This remark most probably refers in particular to the first double pure white Dahlia which was raised by Arentz, of Leyde, in 1821 From two ground roots he obtained 36 young plants. The Haarlem firm, A. C. van Eeden and Co., bought half the stock, and the Dahlia was afterwards distributed under the name Waverley, and kept its place as the best double white Dahlia for many years.

In Germany the Dutch Dahlias were introduced by the bulb grower, R. C. Affourtit, of Lisse, who made an arrangement with one of his customers at Leipsic, enabling him to show Dahlia flowers at the yearly markets there, so as to advertise his tubers. These flowers caused such a sensation that Mr. Affourtit had to secure the protection of the police against the crowd of admirers who wanted to convince themselves that the objects shown were real flowers. This story seems to prove that the Dutch Dahlias of those days were far in advance of the German seedlings.

The Development of the Show Dahlia.

Very early we find a special reference made in England to dwarf forms. "For these desirable kinds of Dahlias" writes William Smith in the *Transactions of the Horticultural Society*, of 1828, "we are principally indebted to William Wells, Esq. His gardener, Mr. Joseph Wells, possessing due knowledge of the qualities he wished his productions to possess, has succeeded in raising sorts which combine dwarfishness with early and abundant flowering, and produce blossoms of the most beautiful descriptions. They begin flowering in June when not above a foot high, and continue to blossom in constant succession, till the autumn frosts divest them of their beauty, they seldom exceed three feet in height, and some are even more dwarf."

As we have seen before, dwarf forms had been raised already many years ago by Donckelaar, in Belgium, and as his Dahlias were imported in England, it seems very probable that Wells improved the Belgian productions. However this may be, the early English dwarf Dahlias soon spread over the continent of Europe. Enthusiastic articles were devoted to them in the *Revue Horticole* of 1832, and Von Reider's *Annalen der Blumengärtnerei*, of 1833, and many nurseries and private gardens are mentioned, where they were grown.

Besides Wells, other noted growers were Dennis, Girling, Glenny, Harris, Levick, Salter, Whale, Wheeler, Young, and later Keynes, Turner, and many others.

* A paper read by Mr. Ernst H. Krelage before the International Horticultural Congress at Amsterdam, on September 18.

HOT WATER.

It is exactly fifty years since I brought the value of hot water as an insecticide and cleansing agent into notice. Doubtless it had been employed previously, but as the only effective way of securing attention is to keep a subject before the public, I may be allowed to restate and amplify what was noted then.

It was my first charge, and a houseful of Camellias had become so filthy and so colonised by scale as to require continual sponging, without doing much good. So boiling water was obtained, strengthened with soft soap, and forcibly applied to the shrubs by means of a syringe, then the leaves were rubbed clean with a sponge; this treatment was repeated three times in the same summer, with the satisfactory result that the Camellias were left perfectly clean and free from insects. Camellias and some other plants are able to endure the application of very hot water. But in the case of some other plants, vines, for instance, it is not safe to use it warmer than 135° to 150°. At the present time vines infested more or less by any living pest should be freely washed, either with clear hot water at these temperatures or

added soap. Peaches, so frequently subject to insect infestation, may also, after useless shoots have been removed, be treated similarly, and if there should exist any fear of injury, then a little afterwards cold water should be syringed over the trees.

Out-of-door trees, Plums, Pears and Peaches, with scale on them, may be treated similarly, though it may be necessary to repeat the application later in the year. The worst of all insects is no doubt American Blight, so difficult to kill owing to its impenetrable outer, protective covering. Instead of hot water I have successfully used hot petroleum—a rather dangerous oil to heat by ordinary means, but quite safe if poured into a pail or other receptacle containing boiling water, stirring the liquids for a few minutes, after which the oil rises to the top and, taken up by a syringe, may be applied forcibly to the parts affected by the insects. I have never noticed any harm to Apple trees after this drastic treatment, the stems and bare branches only being syringed; the woolly covering of the insect afforded no protection against the hot oil.

I have known the question discussed whether it were better to water plants with cold water or slightly heated. The value of heated water over cold is that it requires a smaller quantity to moisten soil, otherwise I do not think there is much, if any, difference. But in the case of pot plants or borders that have been allowed to become over-dry, then quite warm water should be applied. In the case of house plants, I have made it an invariable rule to water these with heated water, firstly because of the smaller quantity required, and secondly because there are always plants that, standing in overheated positions, are apt to become over-dry in the intervals between attention. For this purpose water from the hot water tap is invaluable, and for peat-potted plants is probably indispensable. Has any reader ever tried hot water for a wasp nest established on a plant in the greenhouse, or in some other equally difficult position? A slight addition of Gishurst renders the application a certain as well as a speedy remedy. I need not mention how much more rapidly pots, stages, etc., are cleansed when hot water is used rather than cold, and, of course, soft water should be used in every instance. *R. P. Brotherston.*

PLANTS NEW OR NOTEWORTHY.

NOTES ON EAST AFRICAN PLANTS.

A glance at a contour map of Africa shows the greater part of the "great dark continent" as a huge plateau, with an average elevation of about 2,200 feet. The coastal plain, below 600 feet, is in some parts very narrow, beyond which the land rises steeply to the plateau, whence the rivers descend by a series of rapids. The Eastern Plateau averages from 3,000-5,000 feet, the highest lands being of igneous origin, like Mt. Ruwensori (18,000 feet), Mt. Elgon (14,000 feet), Mt. Kenya (17,500 feet), and Mt. Kilimanjaro (19,200 feet), near the Eastern Rift Valley. These volcanic peaks capping the plateau are clothed with a vegetation as interesting as it is varied, and they may be likened to oceanic islands in that the floras of their upper slopes are almost as much isolated. The accompanying illustrations, from photographs by Mr. T. Alexander Barns, the explorer, give some idea of the wonderful wealth of plant life found in these regions, where one meets with weird and extensive forests of Senecio and Lobelia of tree-like habit, quite unlike the species of these genera to which we are accustomed in this country. In Fig 74 is shown a sample of the herbaceous vegetation which clothes the savanna or park-like formations, in this case the plant being Clematopsis Stuhlmannii, a species of a new genus described by me a few years ago in the *Kew Bulletin* (1920, p. 20). From a phylogenetic point of view Clematopsis is of extraordinary interest, for it forms a link between the genera Anemone and Clematis which had not before been recognised, thus showing a close connection between the tribes Anemoneae and Clematideae of the family Ranunculaceae, and incidentally pointing to the true origin of Clematis out of Anemone. Even the veriest tyro in botany knows that the coloured sepals in Anemone are overlapping (imbricate) in the bud stage, whilst in Clematis they merely touch at the edges (valvate). In Clematopsis they are either wholly overlapping or some are overlapping and the remainder touching at the edges in the same flower. On this account I have established the genus Clematopsis. Another of its interesting features is that whilst most of the species have opposite leaves, like Clematis, those of Clematopsis Stanleyi (Clematis Stanleyi) occasionally revert to the alternate form under cultivation.

FIG. 75.—GIANT EUPHORBIAS (E. ABYSSINICA?) ON THE NGORONGORO CRATER, WITH LAKE MAGAD IN THE BACKGROUND.

According to Welwitsch, species of Clematopsis form almost a dominant feature of the vegetation in the elevated regions of Angola, where large tracts of pasture ground amidst the forests look at a distance in the flowering season as if covered with snow. Mr. Barns' photograph shows a somewhat less vivid picture in the highlands of East Africa.

A scene more typical of Abyssinia is seen in Fig. 75—that of the great Ngorongoro Crater and its lake, called Magad by the Masai people. In the far distance may be seen the opposite side of the crater ring, and in the foreground some exceptionally large examples of tree Euphorbia, probably Euphorbia abyssinica. Many of these trees must be of considerable antiquity, and at one time no doubt dominated the landscape even more than at the present day. *John Hutchinson, Kew.*

TREES AND SHRUBS.

NOTOSPARTIUM CARMICHAELIAE.

This little shrub, sometimes called the Pink Broom, will reach a height of four or five feet, and always attracts attention on account of its fine, Cytisus-like foliage. It flowers in the Autumn and although the flowers are small, the plant is covered with them. Being a native of New Zealand, it is somewhat tender, especially in a small state, and should be planted in a warm, sunny position and protected in very cold weather. As it grows and the wood becomes harder it will stand more extremes of weather, and any shoots that die may be cut back and the plant will break into growth again in the spring. The foliage is so fine that the stems almost look bare, and it has a very pleasing habit of growth.

The soil in which this Notospartium is planted should be well drained and made firm. The plant should be staked for a few years until it is strong enough to take care of itself. It is a gem for the front of the shrubbery. The flowers are dark rosy-pink and they are borne all over the tiny branches.

BROOMS OF LATE SUMMER.

Although the excellent late-flowering form of the common Broom, Cytisus scoparius, may often be relied upon to bloom until July is far spent, one has to depend on others to carry on the succession of flowering through August into autumn. The best of these is C. nigricans, which will make a neat-habited bush some 6 ft. in height, covered with fine spikes of citron-yellow blossoms at a season when most things have gone off. C. n. longispicatus is a form of this plant with even larger bloom sprays, and another admirable variety is C. n. Carlieri, which will often remain in flower until October. The members of the nigricans groups are among the few Brooms which are the better for pruning, and the young wood should be cut hard back in February.

C. purgans, a very hardy, low-growing bush from the mountains of France, and one of the parents of the beautiful C. praecox, is, strictly speaking, an April bloomer. But when this species gets a good check during a midsummer drought it will not infrequently break into bloom again in early autumn. Though the habit is stiff the colour of C. purgans is a rich golden yellow and the blossoms are very fragrant. C. schipkaensis is a late-summer, prostrate Broom bearing terminal clusters of creamy-white flowers which, in a favourable season, will persist for many weeks. It is certainly distinct if not a showy species and is a good rock-garden subject.

That somewhat tender Sicilian, Genista aetnensis, was in full flower in mid-August, and its long, pendulous, rush-like twigs with their shower of gold flowers produce a very charming effect. G. radiata, also a native of Southern Europe, is a grey-green, spiny shrub of about 3 ft. whose bright yellow blossoms are usually contemporary with those of the above.

Though its yellow is not of so pleasing a shade as that of most Brooms, the merits of our own G. tinctoria should not be overlooked since its very late flowering is a feature of the utmost value. This shrub, with its dark green, glossy foliage, is a good subject for open woodland or associating with Heaths, but G. t. var. elatior, which is taller, growing to over 4 ft., is a distinct improvement on the type, bearing larger and more showy terminal panicles of flower. The prostrate, double form of G. tinctoria is usually much earlier with us and is an admirable little shrub for the rock garden. But G. corniola mantica, which appears to be a semi-prostrate form of G. tinctoria, and also an early bloomer, may generally be expected to produce a second crop of blossom in autumn.

No reference to the late-flowering Brooms would be complete without a mention of that splendid old shrub, Spartium junceum. We grow this extensively grouped under tall woodland trees, among other places, and from early June to nearly Christmas it maintains an unbroken succession of its fine, sweet-scented blossoms. Though these Spartiums never get any attention they invariably flower profusely and only when, owing to old age, they get lanky and ungainly are they replaced by young plants. S. junceum will, of course, break more readily than the Brooms if cut hard back to old wood, but fresh plants are so easily and quickly raised from seed that we consider replanting the more satisfactory method of renovating worn-out groups. *N. Wales.*

VIBURNUM CARLESII.

This beautiful Viburnum is a native of Corea and is quite hardy, and I know of no shrub that has such a delicious scent. It does not grow very tall, but spreads well and the foliage is broad and somewhat rough.

The waxy, white flowers are borne in a cluster at the top of the shoots, not unlike those of a white Bouvardia. The plant prefers a rich, moist soil and requires little or no pruning. It is a shrub that should be in every collection, however small, and is also suitable for growing in pots. This shrub flowers in April and will do equally well in sun or shade provided it has good soil to grow in.

CARYOPTERIS MASTACANTHUS.

This deciduous shrub from China is sometimes called the Blue Spiraea. It is of dwarf habit, with silvery green foliage and blue flowers somewhat darker than those of Ceanothus Gloire de Versailles.

It is a splendid plant for a warm, sunny position, and flowers in September, which makes it especially valuable. The shoots should be pruned to two or three eyes during April and all weak wood taken out. The plant is apt to become overcrowded; therefore, to ensure fine, strong spikes of bloom the growths should be thinned when they commence to grow. It has never been so good with us as it was during the hot summer of 1921. The plant was well watered and was a mass of flower during September of that year. *T.*

NOTICES OF BOOKS.

The Gardens of Hampton Court.

Visitors to Hampton Court who are interested in the gardens and who, lacking much knowledge of plants, desire to know the different species grown there will find in Mr. Law's little book* a useful guide. In his brief account of the history of the Hampton Court Gardens, the author describes the additions which have been made since the Cardinal Wolsey's days. Henry VIII. added largely to them, causing to be laid out the King's Privy Garden and embellishing the gardens with fountains and arbours. In his day also an orchard was planted where is now the Wilderness. Another innovator was Queen Elizabeth, and so the gardens continued with little change until William III. undertook their entire transformation. The Great Fountain Garden, the Privy Garden and the Wilderness are due to William III., and it was he who planted the clipped Yews, rare shrubs and the Lime walks of the Great Fountain Garden. The Maze also was probably made in his time, and it is interesting to note that, according to Mr. Law, Hornbean was originally the chief plant, but that it has now become a mixed plantation of Privet, Yew and Laurel. The gardener, Switzer, did not think much of its intricacy, and claimed that in one of his own design you could lose your way twenty times, whereas at Hampton Court you could only do so three or four times. Lists of plants in the several gardens and plants thereof make up the bulk of the book, and appear to be so complete that a visitor with the guide in hand should be able to identify every plant that grows there.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante, pp. 71-76.)

(*Continued from page* 190.)

WALES.*

Cardiganshire.—All varieties of fruit trees flowered very freely in this district, but the weather was very unfavourable at the time, and only a very small proportion of the trees are bearing fruits. Amongst Pears, trees of Doyenné du Comice and Emile d'Heyst are fruiting, and the following Apples are also bearing fair crops: Allen's Everlasting, Charles Ross, King of the Pippins, Lord Grosvenor, Warner's King, and Christmas Pearmain. Of Plums only trees of Victoria, Czar, and Monarch are fruiting. Our soil is of heavy texture and cold, overlying a subsoil of slaty rock. *W. Phillips, The Gardens, Derry Ormond.*

——Apple, Pear and Plum trees flowered well, but the inclement weather of spring proved disastrous to the crops, especially during the month of May, when heavy showers of hail fell at intervals; both leaves and flowers were blown off the trees. Frost was responsible for a lot of damage during the last week of May. The three crops mentioned above are very deficient. Raspberries are scarce, but Gooseberries, Strawberries and both Red and Black Currants were equal to the average. Nuts are very scarce. Winter spraying was carried out here, with the result that few caterpillars troubled us. The Apple blossom weevil does a lot of damage. Spraying against the Plum aphis had little effect, as the spray material was repeatedly washed off before it became effectual. Leaf cluster cup on Gooseberries is on the decline, owing to spraying with a strong solution of copper sulphate. The garden is 580 feet above sea level, and lies in a valley encircled by hills rising from 200 to 300 feet, with a narrow inlet from the East and S.S.W. The soil of these gardens is a medium loam resting on a subsoil of gravel. *D. H. Dunn, Hafod, Devil's Bridge.*

Denbighshire.—Most varieties of Apples set badly; Lord Grosvenor, Warner's King, Mère de Ménage, James Grieve, Worcester Pearmain, and Charles Ross being amongst the best cropped varieties. Some Pear trees had an abundance of blossom, but the fruits failed to set owing to cold, sunless weather; many of the trees flowered for a second time. The Plum trees appeared to set a heavy crop, but owing to drying winds and sunless weather the fruits dropped when they were about the size of small Peas. Aphis on the young shoots has given a great amount of trouble. Cherries were the only satisfactory stone fruit crop. Black fly has been troublesome on Cherry trees. Peaches and Nectarines are affected with shot-hole fungus, and Peach-leaf blister has been very prevalent. The only variety of Peach carrying a crop is Princess of Wales. Apricots showed a quantity of flower but the fruits failed to set. Red Currants, Gooseberries and Loganberries were all very good. Raspberries needed rain to swell the young fruits. Aphis has been bad on Currants and Gooseberries. Strawberries were satisfactory, with the exception of being very late in ripening. There was very little mildew either on the plants or on the fruits. The soil here is a stiff loam, overlying clay, and the position north, sheltered from strong winds. *R. H. Crockford, Horsley Hall Gardens, Gresford.*

——Although fruit trees flowered fairly freely, cold, sunless weather in spring militated against the setting of the fruits. There are very few Pears, and Apples are much under the average yield. The varieties Lord Grosvenor, James Grieve, and Cox's Orange Pippin are carrying the best crops. Raspberries, Gooseberries and Currants were all good. Loganberries were a heavy crop. Strawberries were under the average quantity, but of good quality. *F. C. Puddle, Bodnant Gardens, Tal-y-Cafn.*

ROYAL HORTICULTURAL SOCIETY.

EXHIBITION AT HOLLAND PARK HALL.

OCTOBER 2, 3 and 4.

The Royal Horticultural Society's Autumn Exhibition, held on the above dates in the spacious Holland Park Hall, Kensington, was extensive, effective and interesting, but we do not think it was quite so attractive as the corresponding show in 1922. Michaelmas Daisies were very much in evidence; indeed, too much so, as they emphasised the fact of autumn. Other hardy flowers were, however, shown extensively, and the yellow and red colouring of many relieved the mistiness and comparative dullness of the perennial Asters. In this they were assisted by generous displays of Gladioli, and by groups of Dahlias and Chrysanthemums. Trees and shrubs were also represented by autumn colouring; berry-bearing shrubs were not so conspicuous as could have been wished.

This great autumn show combines in itself what were formerly the two distinct shows of fruits and vegetables, but whereas trade displays of fruits and vegetables were splendidly arranged in the body of the hall, the competitive classes were provided for in the long galleries, which, on the opening day, very few people reached. This is a great pity, as formerly the competition proved a great attraction, especially for professional gardeners.

A goodly number of novelties came under the consideration of the standing committees, and the Floral Committee granted ten Awards of Merit, after patiently considering several dozens of flowers and plants. Those which gained awards were crowded together on one of the tables, so that many visitors missed them completely; more room and a conspicuous position should be provided for those subjects the committee may honour. The Orchid Committee had a less busy time, and the Fruit and Vegetable Committee could not complain of overwork.

The joint R.H.S. and National Dahlia Society Committee considered numerous Dahlias, and selected five for trial at Wisley next year.

The attendance on the opening day was good and the weather kindly, but there was not a crush such as is experienced at the Chelsea show.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Messrs. J. O'Brien (Hon. Secretary), Gurney Wilson (Assistant Secretary), E. R. Ashton, W. H. Hatcher, R. G. Thwaites, Arthur Dye, J. E. Shill, H. G. Alexander, S. W. Flory, J. T. Barker, Chas. H. Curtis, Pantia Ralli, Clive Cookson, J. Cypher, A. McBean, H. T. Pitt, Fred. K. Sander, Stuart H. Low, C. J. Lucas, W. H. White, W. J. Kaye, and J. Wilson Potter.

First Class Certificate.

Laelio-Cattleya Marina var. majestica (*C. Hardyana* × *L.-C. St. Gothard*) from Messrs. Cowan and Co., Southgate. One of the finest crosses with the favourite L.-C. St. Gothard (C. Hardyana × L.-C. Gottoiana), the second use of C. Hardyana giving surprising results. The plant bore a fine spike of large and well formed flowers nearest to L.-C. St. Gothard. The sepals and petals are bright rosy-mauve, the immense lip ruby-crimson in front, the disc yellow and with gold lines at the base.

Awards of Merit.

Cattleya Aeneas var. Goliath (*Dowiana aurea* × *Venus*) from Messrs. Cowan and Co. The largest form of the cross with well formed bright yellow flowers, the showy lip being rose-crimson in front, the base with yellow lines extending to the isthmus in the middle, which approaches some of the forms of C. Venus.

Brasso-Laelio-Cattleya maculata The Dell variety (*B.-L.-C. The Baroness* × *L.-C. Thyone*) from Baron Bruno Schroder, The Dell Park, Englefield Green (gr. Mr. J. E. Shill). A very fine improvement on the showy yellow-flowered section raised at The Dell, the first of which flowered in 1920 and was a companion to the B.-L.-C. Amber, which was also a hybrid of B.-L.-C. The Baroness. Two plants of the cross were shown, each with strong spikes of good bright yellow flowers with some rose colour on the front of the showy lip.

Sophro-Laelio-Cattleya His Majesty var. Flammea (*S.-L.-C. Marathon* × *C. Trianae Backhousiana*), from Messrs. Charlesworth and Co., Haywards Heath. A grand flower shaped like the best forms of C. Trianae. The sepals and petals are bright rosy-mauve with a gold shade, the petals having a purple band as in C. T. Backhousiana; the lip is ruby-crimson with a bright yellow disc.

FIG. 76 SOLIDAGO MISSOURIENSIS. GAINED AN AWARD OF MERIT FROM THE ROYAL HORTICULTURAL SOCIETY, AS ASTER HYBRIDUS LUTEUS, ON AUGUST 22, 1922, WHEN IT WAS SHOWN BY MR. AMOS PERRY, WHO ALSO EXHIBITED IT AT HOLLAND PARK HALL.

Laelio-Cattleya Mrs. Medo var. Sovereign (*C. Venus* × *L.-C. luminosa*), from Messrs. Stuart Low and Co., Jarvisbrook. The third and best of the cross to receive an award. The flowers are clear canary-yellow, the large labellum velvety crimson, the front extended on a narrow middle lobe as in C. Iris.

Cattleya Tagus var. Cupid (*Rhoda* × *King George*), from Messrs. Flory and Black, Slough. Flower large and finely formed of clear yellow colour with crimson lip.

Groups.
